EVANGELICAL CHURCH CONFERENCE, a convention of delegates from the different Protestant churches of Germany. The conference originated in 1848, when the general desire for political unity made itself felt in the ecclesiastical sphere as well. A preliminary meeting was held at Sandhof near Frankfort in June of that year, and on the 21st of September some five hundred delegates representing the Lutheran, the Reformed, the United and the Moravian churches assembled at Wittenberg. The gathering was known as Kirchentag (church diet), and, while leaving each denomination free in respect of constitution, ritual, doctrine and attitude towards the state, agreed to act unitedly in bearing witness against the non-evangelical churches and in defending the rights and liberties of the churches in the federation. The organization thus closely resembles that of the Free Church Federation in England. The movement exercised considerable influence during the middle of the 19th century. Though no Kirchentag, as such, has been convened since 1871, its place has been taken by the Kongress für innere Mission, which holds annual meetings in different towns. There is also a biennial conference of the evangelical churches held at Eisenach to discuss matters of general interest. Its decisions have no legislative force.

EVANGELICAL UNION, a religious denomination which originated in the suspension of the Rev. James Morison (1816–1893), minister of a United Secession congregation in Kilmarnock, Scotland, for certain views regarding faith, the work of the Holy Spirit in salvation, and the extent of the atonement, which were regarded by the supreme court of his church as anti-Calvinistic and heretical. Morison was suspended by the presbytery in 1841 and thereupon definitely withdrew from the Secession Church. His father, who was minister at Bathgate, and two other ministers, being deposed not long afterwards for similar opinions, the four met at Kilmarnock on the 16th of May 1843 (two days before the "Disruption" of the Free Church), and, on the basis of certain doctrinal principles, formed themselves into an association under the name of the Evangelical Union, "for the purpose of countenancing, counselling and otherwise aiding one another, and also for the purpose of training up spiritual and devoted young men to carry forward the work and 'pleasure of the Lord.'" The doctrinal views of the new denomination gradually assumed a more decidedly anti-Calvinistic form, and they began also to find many sympathizers among the Congregationalists of Scotland. Nine students were expelled from the Congregational Academy for holding "Morisian" doctrines, and in 1845 eight churches were disjoined from the Congregational Union of Scotland and formed a connexion with the Evangelical Union. The Union exercised no jurisdiction over the individual churches connected with it, and in this respect adhered to the Independent or Congregational form of church government; but those congregations which originally were Presbyterian vested their government in a body of elders. In 1889 the denomination numbered 93 churches; and in 1884, after prolonged negotiation, the Evangelical Union was incorporated with the Congregational Union of Scotland.

See The Evangelical Union Annual; History of the Evangelical Union, by F. Ferguson (Glasgow, 1876); The Work of the E.U. (1883); W. Adamson, Life of Dr. James Morison (1898).

EVANS, CHRISTMAS (1766–1838). Welsh Nonconformist divine, was born near the village of Llandysul, Cardiganshire, on the 25th of December 1766. His father, a shoemaker, died early, and the boy grew up as an illiterate farm labourer. At the age of seventeen, becoming servant to a Presbyterian minister, David Davies, he was affected by a religious revival and learned to read and write in English and Welsh. The itinerant Calvinistic Methodist preachers and the members of the Baptist church at Llandysul further influenced him, and he soon joined the latter denomination. In 1789 he went into North Wales as a preacher and settled for two years in the desolate peninsula of Lleyn, Carnarvonshire, whence he removed to Llangefni in Anglesey. Here, on a stipend of £1 a year, supplemented by a little tract-selling, he built up a strong Baptist community, moulding his organization to some extent on that of the Calvinistic Methodists. Many new chapels were built, the money being collected on preaching tours which Evans undertook in South Wales.

In 1826 Evans accepted an invitation to Caerphilly, where he remained for two years, removing in 1828 to Cardiff. In 1832, in response to urgent calls from the north, he settled in Carnarvon and again undertook the old work of building and collecting. He was taken ill on a tour in South Wales, and died at Swansea on the 19th of July 1838. In spite of his early disadvantages and personal disfigurement (he had lost an eye in a
EVANS, E. H.—EVANS, O.,

youthful brawij, Christmas Evans was a remarkably powerful preacher. To a natural aptitude for this calling he united a nimble mind and an inquiring spirit; his character was simple, his piety humble and his faith fervently evangelical. For a time he came under Sandemanian influence, and when the Wesleyans entered Wales he took the Calvinist side in the bitter controversies that were frequent from 1800 to 1810. His chief characteristic was a remarkable power of coherent imagination, which absorbed and controlled all his other powers, and earned for him the name of the "Bunyan of Wales."

His works were edited by Owen Davies in 3 vols. (Carnarvon, 1895-1897). See the Leies by D. R. Stephens (1847) and Paxton Hood (1885).

EVANS, EVAN HERBER (1836-1896), Welsh Nonconformist divine, was born on the 5th of July 1836, at Pant yr Onen near Newcastle Emlyn, Cardiganshire. As a boy he was saved by the "Rebecca Riots," and went to school at the neighbouring village of Llchryd. In 1853 he went into business, first at Pontypridd and then at Merthyr, but next year made his way to Liverpool. He decided to enter the ministry, and studied arts and theology respectively at the Normal College, Swansea, and the Memorial College, Brecon, his convictions being deepened by the religious revival of 1858-1859. In 1862 he succeeded Thomas Jones as minister of the Congregational church at Morriston near Swansea. In 1865 he became pastor of Salem church, Carnarvon, a charge which he occupied for nearly thirty years despite many irritations to English pastors. In 1894 he was made principal of the Congregational college at Bangor. He died on the 30th of December 1896. He was chairman of the Welsh Congregational Union in 1886 and of the Congregational Union of England and Wales in 1892; and by his earnest ministry, his eloquence and his literary work, especially in the denominational paper Y Dysgedydd, he achieved a position of great influence in his country.

See Life by H. Elvet Lewis.

EVANS, SIR GEORGE DE LACY (1757-1870), British soldier, was born at Moïl, Limerick, in 1787. He was educated at Woolwich Academy, and entered the army in 1806 as a volunteer, obtaining an ensigncy in the 2nd regiment in 1807. His early service was spent in India, but he exchanged into the 3rd Light Dragoons in order to take part in the Peninsular War, and was present in the retreat from Burgos in 1812. In 1813 he was at Vittoria, and was afterwards employed in making a military survey of the passes of the Pyrenees. He took part in the campaign of 1814, and was present at Pampeluna, the Nile and Toulouse; and later in the year he served with great distinction on the staff in General Ross's Bladensburg campaign, and took part in the capture of Washington and of Baltimore and the operations before New Orleans. He returned to England in the spring of 1815, in time to take part in the Waterloo campaign as adjutant to the 3rd division, and subsequently to serve as quarter-master-general on Sir T. Picton's staff. As a member of the staff of the duke of Wellington he accompanied the English army to Paris, and remained there during the occupation of the city by the allies. He was still a substantive captain in the 5th West India regiment, though a lieutenant-colonel by brevet, when he went on half-pay in 1818. In 1830 he was elected M.P. for Rye in the Liberal interest; but in the election of 1832 he was an unsuccessful candidate both for that borough and for Westminster. For the latter constituency he was, however, returned in 1831, and, except in the parlamentary session of 1841-1846, he continued to represent it till 1865, when he retired from political life. His parliamentary duties did not, however, interfere with his career as a soldier. In 1835 he went out to Spain in command of the Spanish Legion, recruited in England, and 9000 strong, which served for two years in the Carlist War on the side of the queen of Spain. In spite of great difficulties the legion won great distinction on the battlefields of northern Spain, and Evans was able to say that no prisoners had been taken from it in action, that it had never lost a gun or an equipage, and that it had taken 27 guns and 3100 prisoners from the enemy. He received several Spanish orders, and on his return in 1839 was made a colonel and K.C.B. In 1846 he became major-general; and in 1854, on the breaking-out of the Crimean War, he was made lieutenant-general and appointed to command the 2nd division of the Army of the East. At the battle of the Alma, where he received a severe wound, his quick comprehension of the features of the combat largely contributed to the victory. On the 26th of October he defeated a large Russian force which attacked his position on Mount Inkerman. Illness and fatigue compelled his return to England. In 1857 he led his division in the hands of General Pennfather; but he rose from his sick-bed on the day of the battle of Inkerman, the 5th of November, and, declining to take the command of his division from Pennfather, aided him in the long-protracted struggle by his advice. On his return invalided to England in the following February, Evans received the thanks of the House of Commons. He was made a G.C.B., and the university of Oxford conferred on him the degree of D.C.L. In 1861 he was promoted to the full rank of general. He died in London on the 9th of January 1870.

EVANS, SIR JOHN (1823-1908), English archaeologist and geologist, son of the Rev. Dr A. B. Evans, head master of Market Bosworth grammar school, was born at Britwell Court, Bucks, on the 17th of November 1823. He was for many years head of the extensive paper manufactory of Messrs John Dickinson at Nash Mills, Hemel Hempstead, but was especially distinguished as an antiquary and numismatist. He was the author of three books, standard in their respective departments: The Coins of the Ancient Britons (1864); The Ancient Stone Implements, Weapons and Ornaments of Great Britain (1872, 2nd ed. 1879); and The Ancient Ornaments of Great Britain and Ireland (1881). He also wrote a number of separate papers on archaeological and geological subjects—notably the papers on "Flint Implements in the Drift" communicated in 1860 and 1862 to Archaeologia, the organ of the Society of Antiquaries. Of that society he was president from 1885 to 1892, and he was president of the Numismatic Society from 1874 to the time of his death. He also presided over the Geological Society, 1874-1876; the Anthropological Institute, 1877-1879; the Society of Chemical Industry, 1892-1893; the British Association, 1897-1898; and for twenty years (1879-1898) he was treasurer of the Royal Society. As president of the Society of Antiquaries he was an ex officio trustee of the British Museum, and subsequently he became a permanent trustee. His academic honours included honorary degrees from several universities, and he was a corresponding member of the Institut de France. He was created a K.C.B. in 1892. He died at Berkhamsted on the 31st of May 1908.

His eldest son, ARTHUR JOHN EVANS, born in 1851, was educated at Brasenose College, Oxford, and Göttingen. He became fellow of Brasenose and in 1884 keeper of the Ashmolean Museum at Oxford, and afterwards the first assistant keeper in the British Museum, in 1873-1874, and in 1875 made a special study of archaeology and ethnology in the Balkan States. In 1883 he began his investigations in Crete, which have resulted in discoveries of the utmost importance concerning the early history of Greece and the eastern Mediterranean (see Aegean Civilization and Cretan). He is a member of all the chief archaeological societies in Europe, holds honorary degrees at Oxford, Edinburgh and Dublin, and is a fellow of the Royal Society. His chief publications are: Cretan Pictographs and Pse-Phoenician Script (1866); Further Discoveries of Cretan and Aegean Script (1868); The Minoan Bee and Pillar Cult (1901); Scriba Minoa (1900 foll.); and reports on the excavations. He also edited with additions Freeman's History of Sicily, vol. iv.

EVANS, OLIVER (1755-1819), American mechanician, was born at Newport, Delaware, in 1755. He was apprenticed to a wheelwright, and at the age of twenty-two he invented a machine for making the card-teeth used in carding wool and cotton. In 1780 he became partner with his brothers, who were practical millers, and soon introduced various labour-saving appliances which both cheapened and improved the processes of flaxen and woolen manufacture. Turner's invention was to substitute a steady supply of steam at a relatively high pressure, and the plans of his invention which he sent over to England in 1787 and in 1794-1795 are said
to have been seen by R. Trevithick, whom in that case he anticipated in the adoption of the high-pressure principle. He made use of his engine for driving mill machinery; and in 1803 he constructed a steam dredging machine, which also propelled itself on land. In 1819 a disastrous fire broke out in his factory at Pittsburg, and he did not long survive it, dying on New York on the 21st of April 1819.

**EVANSON, EDWARD** (1731–1805). English divine, was born on the 21st of April 1731 at Warrington, Lancashire. After graduating at Cambridge (Emmanuel College) and taking holy orders, he officiated for several years as curate at Mitcham. In 1768 he became vicar of South Mimms near Barnet; and in November 1769 he was presented to the rectory of Tewkesbury, with which he held also the vicarage of Longdon in Worcester-shire. In the course of his studies he discovered what he thought important variance between the teaching of the Church of Eng- land and that of the Bible, and he did not conceal his convictions. In reading the service he altered or omitted phrases which seemed to him unwise, and in reading the Scriptures pointed out errors in the translation. A crisis was brought on by his sermon on the resurrection, preached at Easter 1771; and in November 1773 a prosecution was instituted against him in the consistory court of Gloucester. He was charged with "depriving the public worship of God contained in the liturgy of the Church of England, asserting the same to be superstitious and unchristian, preaching, writing and conversing against the creeds and the divinity of our Saviour, and assuming to himself the power of making arbitrary alterations in his performance of the public worship." A protest was at once signed and presented to him by several of his parishioners against the prosecution. The case was dis- missed on technical grounds, but appeals were made to the court of arches and the court of delegates. Meanwhile Evanston had made his views generally known by several publications. In 1772 appeared anonymously his *Doctrines of a Trinity and the Incarnation of God, examined upon the Principles of Reason and Common Sense*. This was followed in 1777 by a Letter to Dr Hurd, Bishop of Worcester, wherein the Importance of the Prophecies of the New Testament and the Nature of the Grand Apos- tasy predicted in them are particularly and impartially considered. He also wrote some papers on the Sabbath, which brought him into controversy with Joseph Priestley, who published the whole discussion (1792). In the same year appeared Evanston's work entitled The Dissonance of the four generally received Evangelists, to which replies were published by Priestley and David Simpson (1793). Evanston rejected most of the books of the New Testa- ment as forgeries, and of the four gospels he accepted only that of St Luke. In his later years he ministered to a Unitarian congregation at Lynmouth, Devonshire. In 1802 he published *Reflections upon the State of Religion in Christendom*, in which he attempted to explain and illustrate the mysterious foreshadow- ings of the Apocalypse. This he considered the most important of his writings. Shortly before his death at Colford, near Crediton, Devonshire, on the 25th of September 1805, he com- pleted his Second Thoughts on the Trinity, in reply to a work of the bishop of Gloucester.

His sermons (prefaced by a Life by G. Rogers) were published in two volumes in 1808. The occasion of T. Vallence's *Bampton Lectures* in 1811. A narrative of the circumstances which led to the prosecution of Evanston was published by N. Havard, the town-clerk of Tewkesbury, in 1778.

**EVANSTON,** a city of Cook county, Illinois, U.S.A., on the shores of Lake Michigan, 12 m. N. of Chicago. Pop. (1900) 19,259, of whom 4444 were foreign-born; (1910 U. census) 24,678. It is served by the Chicago & North-Western, and the Chicago, Milwaukee & St Paul railways, and by two electric lines. The city is an important residential suburb of Chicago. In 1908 the Evanston public library had 41,430 volumes. In the city are the College of Liberal Arts (1855), the Academy (1860), and the schools of music (1865) and engineering (1908) of North- western University, co-educational, chartered in 1851, opened in 1855, the largest school of the Methodist Episcopal Church in America. In 1909-1910 it had productive funds amounting to about $7,500,000, and, including all the allied schools, a faculty of 418 instructors and 4487 students; its schools of medicine (1860), law (1859), pharmacy (1886), commerce (1908) and dentistry (1889) are in Chicago. In 1909 its library had 114,856 volumes and 79,000 pamphlets (exclusive of the libraries of the professional schools in Chicago); and the Garrett Biblical Institute had a library of 25,671 volumes and 4500 pamphlets. The university maintains the Grand Prairie Seminary at Onarga, Iroquois county, and the Elgin Academy at Elgin, Kane county. Enjoying the privileges of the university, though actually independent of it, are the Garrett Biblical Institute (Evaston Theological Seminary), founded in 1855, situated on the university campus, and probably the best-endowed Methodist Episcopal theological seminary in the United States, and affiliated with the Institute, the Norwegian Danish Theological school; and the Swedish Theological Seminary, founded at Galesburg in 1879, removed to Evanston in 1882, and occupying buildings on the university campus until 1907, when it removed to Orrington Avenue and Noyes Street. The Cummack School of Oratory, at Evanston, also co-operates with the university. By the charter of the university the sale of intoxicating liquors is forbidden within 4 m. of the university campus. The manufacturing importance of the city is slight, but that of its manufacturing industries is rapidly increasing. The principal manufactures are wrought iron and steel pipe, bakers' machinery and bricks. In 1905 the value of the factory products was $2,550,529, being an increase of 207.3% since 1900. In Evanston are the publishing offices of the National Woman's Christian Temperance Union. Evanston was incorporated as a town in 1863, and as a village in 1872, and is chartered as a city in 1899. The villages of North Evanston and South Evanston were annexed to Evanston in 1874 and 1892 respectively.

**EVANSVILLE,** a city and the county-seat of Vanderburgh county, Indiana, U.S.A., and a port of entry, on the N. bank of the Ohio river, 200 m. below Louisville, Kentucky—measuring by the windings of the river, which double the direct distance. Pop. (1890) 50,755; (1900) 59,007; (1910 census) 69,047. Of the total population in 1900, 5318 were negroes, 5626 were foreign-born (including 4360 from Germany and 384 from Eng- land), and 17,419 were of foreign parentage (both parents foreign-born), and of these 13,010 were of German parentage. Evansville is served by the Evansville & Terre Haute, the Evansville & Indianapolis, the Illinois Central, the Louisville & Nashville, the Louisville, Henderson & St Louis, and the Southern railways, by several interurban electric lines, and by river steamboats. The city is situated on a plateau above the river, and has a number of fine business and public buildings, including the court house and city hall, the Southern Indiana hospital for the insane, the United States marine hospital, and the Willard library and art gallery, containing in 1908 about 30,000 volumes. The city's numerous railway connections and its situation in a coal-producing region (there are five mines within the city limits) and on the Ohio river, which is navigable nearly all the year, combine to make it the principal commercial and manufacturing centre of Southern Indiana. It is in a tobacco-growing region, is one of the largest hardwood lumber markets in the country, and has an important shipping trade in pork, agricultural products, dried fruits, lime and limestone, flour and tobacco. Among its manufactures in 1905 were flour and gist mill products (value, $2,689,014), furniture ($1,655,240), lumber and timber products ($1,220,533), railway cars ($1,128,376), packed meats ($886,000), woolen, and worsted goods ($1,570,000), malt liquors, carriages and wagons, leather and canned goods. The value of the factory products increased from $12,167,524 in 1900 to $19,201,716 in 1905, or 57.8% and in the latter year Evansville ranked third among the manufacturing cities in the state. The waterworks are owned and operated by the city. First settled about 1812, Evansville was laid out in 1817, and was named in honour of Robert Morgan Evans (1783–1844), one of its founders, who was an officer under General W. G. Harrison in the war of 1812. It soon became a thriving commercial town with an extensive river trade, was incorporated in 1819, and received a city charter in 1847. The completion of the Wabash
EVARISTUS—EVE

& Erie Canal, in 1853, from Evansville to Toledo, Ohio, a distance of 400 m., greatly accelerated the city’s growth.

EVARISTUS, fourth pope (c. 98–105), was the immediate successor of Clement.

EVARITS, William Maxwell (1818–1901), American lawyer, was born in Boston on the 6th of February 1818. He graduated at Yale in 1837, was admitted to the bar in New York in 1841, and soon took high rank in his profession. In 1850 he was chairman of the New York delegation to the Republican national convention. In 1861 he was an unsuccessful candidate for the United States senatorship from New York. He was chief counsel for President Johnson during the impeachment trial, and from July 1868 until March 1869 he was attorney-general of the United States. In 1872 he was counsel for the United States in the “Alabama” arbitration. During President Hayes’s administration (1877–1881) he was secretary of state; and from 1885 to 1881 he was one of the senators from New York. As an orator Senator Evarts stood in the foremost rank, and some of his best speeches were published. He died in New York on the 28th of February 1901.

EVE, the English transcription, through Lat. Eva and Gr. Êva, of the Hebrew name Ḥawah, given by Adam to his wife because she was “mother of all living,” or perhaps more strictly, “the first of every group of those connected by female kinship” (see W. R. Smith, Kinship, 2nd ed., p. 208), as if Eve were the personification of mother-kinship, just as Adam (“man”) is the personification of mankind.

The abstract meaning “life” (LXX. ζωή), once favoured by Robertson Smith, is at any rate unsuitable in a popular story. Wellhausen and Nöldeke would compare the Ar. ḫayyūtun, “serpent,” and the former remarks that, if this is right, the Israelites received their first ancestress from the Ḥivvites (Ḥivvites), who were originally the serpent-tribe (Composition des Hexateuch, p. 343; cf. Reste arabischen Heidentums, 2nd ed., p. 151). Chittick, 100, assumes a common origin for Ḥawah and the Ḥivvites.

The account of the origin of Eve (Gen. iii. 21–23) runs thus: “And Yahweh-Elohim caused a deep sleep to fall upon the man, and he slept. And he took one of his ribs, and closed up the flesh in its stead, and the rib which Yahweh-Elohim had taken from the man he built up into a woman, and he brought her to the man.” Enchanted at the sight, the man now burst out into elevated, rhythmic speech: “This one,” he said, “at length is bone of my bone and flesh of my flesh,” &c.; to which the narrator adds the comment: “Therefore doth a man forsake his father and his mother, and cleave to his wife, and they become one flesh (body).” Whether this comment implies the existence of the custom of beinah, marriage (W. R. Smith, Kinship, 2nd ed., p. 208), seems doubtful. It is at least equally possible that the expression “his wife” simply reflects the fact that among ordinary Israelites circumstances had quite naturally brought about the prevalence of monogamy. What the narrator gives is not a doctrine of marriage, much less a precept, but an explanation of a simple and natural phenomenon. How is it, he asks, that a man is so largely drawn towards a woman? And he answers: Because the first woman was built up out of a rib of the first man. At the same time it is plain that the already existing tendency towards monogamy must have been powerfully assisted by this presentation of Eve’s story as well as by the prophetic descriptions of Yahweh’s relation to Israel under the figure of a monogamous union.

The narrator is no rhetorician, and spares us a description of the ideal woman. But we know that, for Adam, his strangely produced wife was a “help (or helper) matching or corresponding to him” (cf., as the Authorized Version puts it, “a help meet for him”) (li. 18b). This does not, of course, exclude subordination on the part of the woman; what is excluded is that exaggeration of natural subordination which the narrator may have found both in his

1 That polygamy had not become morally objectionable is shown by the stories of Lamech, Abraham and Jacob.

own and in the neighbouring countries, and which he may have regarded as (together with the pains of parturition) the punishment of the woman’s transgression (Gen. iii. 16). His own ideal of woman seems to have made its way in Palestine by slow degrees. An apocryphal book (Tobit viii. 6, 7) seems to contain the only reference to the section till we come to the time of Christ, to whom the comment in Gen. ii. 24 supplies the text for an authoritative prohibition of divorce, which presupposes and sanctifies monogamy (Matt. x. 7, 8; Matt. xix. 5). For other New Testament applications of the story of Eve see 1 Cor. xi. 9 (especially); 2 Cor. xi. 3; 1 Tim. ii. 13, 14; and in general cf. Adam, and Ency. Biblica, Adam and Eve.

[The seeming omissions in the Biblical narrative have been filled up by imaginative Jewish writers.] The earliest source which remains to us is the Book of Jubilees, or Leptogenesis, a Palestinian work (referred to by R. H. Charles to the century immediately preceding the Christian era; see APOCALYPTIC LITERATURE). In this book, which was largely used by Christian writers, we find a chronology of the lives of Adam and Eve and the names of their daughters—Avan and Azura. The Targum of Jonathan informs us that Eve was created from the thirteenth rib of Adam’s right side, thus taking the view that Adam had a rib more than his descendants. Some of the Jewish legends show clear marks of foreign influence. Thus the notion that the first man was a double being, afterwards separated into the two persons of Adam and Eve (Berachot, 61; Erubin, 18), may be traced back to Philo (De mundi opif. §53; cf. Quast. in Gen. lib. i. §25), who borrows the idea, and almost the words, of the myth related by Aristophanes in the Platonic Symposium (180 b, 100 λ), which, in extravagant form, explains the passion of love by the legend that male and female originally formed one body.

A recent critic (F. Schwall) even holds that this notion was originally expressed in the account of the creation of man in Gen. ii. 7. This involves a textual emendation, and one must at least admit that the present text is not without difficulty, and that Berossus refers to the existence of primeval monstrous androgynous beings according to Babylonian mythology. There is an analogous Iranian legend of the true man, which parted into man and woman in the Bundahish (the Parsi Genesis), and an Indian legend, which, according to Spiegel, has presumably an Iranian source.

It has been remarked elsewhere (Adam, §16) that though the later Jews gathered material for thought very widely, such guidance as they required in theological reflection was mainly derived from Greek culture. What, for in-stance, was to be made of such a story as that in Gen. ii.iv.? To “minds trained under the influence of the Jewish Haggada, in which the whole Biblical history is freely intermixed with legendary and parabolic matter,” the question as to the literal truth of that story could hardly be formulated. It is otherwise when the Greek leaven begins to work.

Josephus, in the prologue to his Archaeology, reserves the problem of the true meaning of the Biblical narrative, but does not say anything as strictly literal. Philo, the great repre-sentative of Alexandrian allegory, expressly argues that in the nature of things the trees of life and knowledge cannot be taken otherwise than symbolically. His interpretation of the creation of Eve is, as has been already observed, plainly suggested by a Platonic myth. The longing for reuniton which love implants in the divided halves of the original dual man is the source of sensual pleasure (symbolized by the serpent), which in turn is the beginning of all transgression. Eve represents the sensuous or perceptive part of man’s nature, Adam the reason. The serpent, therefore, does not venture to attack Adam directly.

1 See West’s authoritative translation in Pahlavi Texts (Sacred Books of the East).

2 Imagination (legendary developments).

3 Spiegel, Erdnische Alterthumskundte, i. 511.

It is sense which yields to pleasure, and in turn enslaves the reason and destroys its immortal virtue. This exposition, in which the elements of the Bible narrative become mere symbols of the abstract notions of Greek philosophy, and are adapted to Greek conceptions of the origin of evil in the material and sensuous part of man, was adopted into Christian theology by Clement and Origen, notwithstanding its obvious inconsistency with the Pauline anthropology, and the difficulty which its supporters felt in reconciling it with the Christian doctrine of the excellence of the married state (Clemens Alex. Stromata, p. 174). These difficulties had more weight with the Western church, which, less devoted to speculative abstractions and more deeply influenced by the Pauline anthropology, refused, especially since Augustine, to reduce Paradise and the fall to the region of pure intelligibilia; though a spiritual sense was admitted along with the literal (Aug. Cit. Der. xii. 21).^1

The history of Adam and Eve became the basis of anthropological discussions which acquired more than speculative importance from their connexion with the doctrine of original sin and the meaning of the sacrament of baptism. One or two points in Augustinian teaching may be here mentioned as having to do particularly with Eve. The question whether the soul of Eve was derived from Adam or directly infused by the Creator is raised as an element in the great problem of traductionism and creationism (De Gen. ad Lit. lib. x.). And it is from Augustine that Milton derives the idea that Adam shaped, not from desire for the forbidden fruit, but because love forbade him to dissociate his fate from Eve's (ibid. lib. xi. sub fin.). Medieval discussion moved mainly in the lines laid down by Augustine. A sufficient sample of the way in which the subject was treated by the schoolmen may be found in the Summa of Thomas, pars i. qu. xii. De productione mulieris.

The Reformers, always hostile to allegory, and in this matter especially influenced by the Augustinian anthropology, adhered strictly to the literal interpretation of the history of the Protocols, which has continued to be generally identified with Protestants, or at most to be adopted as a paraphrase of the confessional doctrine of sin in last century was naturally associated with new theories of the meaning of the biblical narrative; but neither renewed forms of the allegorical interpretation, in which everything is reduced to abstract ideas about reason and sensuality, nor the attempts of Eichhorn and others to extract a kernel of simple history by allowing largely for the influence of poetical form in so early a narrative, have found lasting acceptance. On the other hand, the strict historical interpretation is beset with difficulties which modern interpreters have felt with increasing force, and which he that is a growing man finds difficulty in adopting in one or other form what is called the mythical theory of the narrative. But interpretations pass under this now popular title which have no real claim to be so designated. What is common to the "mythical" interpretations is to find the real value of the narrative, not in the form of the story, but in the thoughts which it embodies. But the story cannot be called a myth in the strict sense of the word, unless we are prepared to place it on one line with the myths of heathenism, produced by the unconscious play of plastic fancy, giving shape to the impressions of natural phenomena on primitive observers. Such a theory does not accord with the idea that Adam shaped, nor is it embodied in the stories of the Old Testament; the religious truths peculiar to the religion of revelation. Other forms of the so-called mythical interpretation are little more than abstract allegory in a new guise, ignoring the fact that the biblical story does not teach general truths which repeat themselves in every individual, but gives a view of the purpose of man's creation, and of the origin of sin, in connexion with the divine plan of redemption. Among his other services in refutation of the unchristian rationalism of last century, Kant has the merit of having forcibly recalled attention to the fact that the narrative of Genesis, even if we do not take it literally, must be regarded as presenting a view of the beginnings of the history of the human race (Maulmasslicher Anfang der Menschengeschichte, 1786). Those who recognize this fact ought not to call themselves or be called by others adherents of the mythical theory, although they also recognize that in the nature of things the divine truths brought out in the history of the creation and fall could not have been expressed either in the form of literal history or in the shape of abstract metaphysical doctrine; or even although they may hold—as is done by many who accept the narrative as a part of supernatural revelation—that the specific biblical truths which the narrative conveys are presented through the vehicle of a story which, at least in some of its parts, may possibly be shaped by the influence of legends common to the Hebrews with their heathen neighbours.

EVELYN, (W. R. S.; [T. K. C.])

EVELETH, a city of St Louis county, Minnesota, U.S.A., about 71 m. N.N.W. of Duluth. Pop. (1900) 2752; (1905, state census) 5332, of whom 2075 were foreign-born (1115 Finns, 676 Austrians and 315 Swedes). (1910) 7036. Eveleth is served by the Duluth, Mesabi and Northern Railway to all parts of the Mesabi Range—the richest in the Lake Superior district—and the mining and shipping of this ore are its principal industries. The municipality owns and operates the water-works, the water being obtained from Lake Saint Mary, one of a chain of small lakes lying S. of the city. Eveleth was first chartered as a city in 1902.

EVELYN, JOHN (1600-1706), English diarist, was born at Wotton House, near Dorking, Surrey, on the 31st of October 1600. He was the younger son of Richard Evelyn, who owned large estates in the county, and was in 1633 high sheriff of Surrey and Sussex. When John Evelyn was five years old he went to live with his mother's parents at Cliffe, near Lewes. He refused to leave his "too indulgent" grandmother for Eton, and when on her husband's death she married again, the boy went with her to Southover, where he attended the free school of the place. He was admitted to the Middle Temple in February 1637, and in May he became a fellow commover of Balliol College, Oxford. He left the university without taking a degree, and in 1640 was residing in the Middle Temple. In that year his father died, and in 1641 he was sent to America as a representative by a well-known volunteer in Ashley's company, then encamped before Genep on the Waal, but his commission was apparently complimentary, his military experience being limited to six days of camp life, during which, however, he took his turn at "trailing a pike." He returned in the autumn to find England on the verge of civil war. Evelyn's part in the conflict is best told in his own words:

"12th November was the battle of Brentford, surprisingly fought. I came in with my horse and arms just at the retreat; but was not permitted to stay longer than the 15th by reason of the army marching to Gloucester; which would have left both me and my brothers exposed to ruin, without any advantage to his Majesty or me. And on the 10th [December] returned to Wotton, nobody knowing of my having been in his Majesty's army."

At Wotton he employed himself in improving his brother's property, making a fishpond, an island and other alterations in the gardens. But he found it difficult to avoid taking a side; he was importuned to sign the Covenant, and "finding it impossible to evade doing very unhandsome things," he obtained leave in October 1643 from the king to travel abroad. From this date his Diary becomes full and interesting. He travelled in France and visited the cities of Italy, returning in the autumn of 1646 to Paris, where he became intimate with Sir Richard Browne, the English resident at the court of France. In June of the following year he married Browne's daughter and heiress, Mary, then a child of not more than twelve years of age.
his wife in the care of her parents, he returned to England to settle his affairs. He visited Charles I. at Hampton Court in 1647, and during the next two years maintained a cipher correspondence with his father-in-law in the royal interest. In 1649 he obtained a pass to return to Paris, but in 1650 paid a short visit to England. The defeat of Charles II. at Worcester in 1651 convinced him that the royalist cause was hopeless, and he decided to return to England. He went in 1652 to Sayes Court at Deptford, a house which Sir Richard Browne had held on a lease from the crown. This had been seized by the parliament, but Evelyn was able to compound with the occupiers for £500, and after that occupation his possession was secured. Here his wife joined him, their eldest son, Richard, being born in August 1653. Under the Commonwealth Evelyn amused himself with his favourite occupation of gardening, and made many friends among the scientific inquirers of the time. He was one of the promoters of the scheme for the Royal Society, and in the king's charter in 1662 was nominated a member of its directing council. Meanwhile he had refused employment from the government of the Commonwealth, and had maintained a cipher correspondence with Charles. In 1659 he published an Apology for the Royal Party, and in December of that year he openly tried to persuade Colonel Herbert Morley, then lieutenant of the Tower on behalf of the General Monk by declaring for the king. From the Restoration onwards Evelyn enjoyed unbroken court favour till his death in 1706; but he never held any important political office, although he filled many useful and often laborious minor posts. He was commissioner for improving the streets and buildings of London, for examining into the affairs of charitable foundations, commissioner of the Mint, and of foreign plantations. In 1664 he accepted the responsibility for the care of the sick and wounded and the prisoners in the Dutch war. He stuck to his post throughout the plague year, contenting himself with sending his family away to Wotton. He found it impossible to secure sufficient money for the proper discharge of his functions, and in 1668 he was still petitioning for payment of his accounts in this business. Evelyn was secretary of the Royal Society in 1672, and as an enthusiastic promoter of its interests was twice (in 1682 and 1691) offered the presidency. Through his influence Henry Howard, duke of Norfolk, was induced to present the Arundel marbles to the university of Oxford (1667) and the valuable Arundel library to Gresham College (1678). In the reign of James II., during the earl of Clarendon's absence in Ireland, he acted as one of the commissioners of the Great Seal. He was embroiled by the king's attacks on the English Church, and refused on two occasions to license the illegal sale of Roman Catholic literature. He concurred in the revolution of 1688, in 1693 was entrusted with the office of treasurer of Greenwich hospital for old sailors, and laid the first stone of the new building on the 30th of June 1696. In 1694 he left Sayes Court to live at Wotton with his brother, whose heir he had become, and whom he actually succeeded in 1699. He spent the rest of his life there, dying on the 27th of February 1706. Evelyn's house at Sayes Court had been let to Captain, afterwards Admiral John Benbow, who was not a "polite" tenant. He sublet it to Peter the Great in 1697 when visiting the dockyard at Deptford. The tsar did great damage to Evelyn's beautiful gardens, and, it is said, made it one of his amusements to ride in a wheelbarrow along a thick holly hedge planted especially by the owner. The house was subsequently used as a workhouse, and is now almshouses, the grounds having been converted into public gardens by Mr Evelyn in 1886.

It will be seen that Evelyn's politics were not of the heroic order. But he was honourable and consistent in his adherence to the monarchical principle throughout his life. With the court of Charles II. he could have had no sympathy, his dignified domestic life and his serious attention to religion standing in the strongest contrast with the profligacy of the royal surroundings. His Diary is therefore a valuable chronicle of contemporary events from the standpoint of a moderate politician and a devout adherent of the Church of England. He had none of Pepys's love of gossip, and was devoid of his all-embracing curiosity, as of his diverting frankness of self-revelation. Both were admirable civil servants, and they had a mutual admiration for each other's sterling qualities. Evelyn's Diary, therefore, has been half a century (1650-1706) crowded with remarkable events, while Pepys only deals with a few years of Charles II.'s reign.

Evelyn was a generous art patron, and Grining Gibbons was introduced to him by the notice of Charles II. His domestic affections were very strong. He had six sons, of whom John (1655-1699), the author of some translations, alone reached manhood. He has left a pathetic account of the extraordinary accomplishments of his son Richard, who died before he was six years old, and of a daughter Mary, who lived to be twenty, and kept up "a tender correspondence with his memory" (note on p. 660). Of his two other daughters, Susannah, who married William Draper of Addiscombe, Surrey, survived him.

Evelyn's Diary remained in MS. until 1818. It is in a quarto volume containing 700 pages, covering the years between 1641 and 1697, and is continued in a smaller book which brings the narrative down to within three weeks of its author's death. A selection from this was edited by William Bray, with the permission of the Evelyn family, in 1818, under the title of Memoirs Illustrative of the Life and Writings of John Evelyn, comprising his Diary from 1641 to 1706, and a Selection of his Familiar Letters. Other editions followed, most notable being those by Mrs. M. B. Wheatley (1879) and Mrs. A. Dobson (1896). Evelyn's Diary contains many other works, and although these have been overshadowed by the famous Diary they are of considerable interest. They include: Observations and Sentiments of Charles II. (1668); a private letter of Francois de la Mothe Vayer, Evelyn's own copy of which contains a note that he was "like to be call'd in question by the Rebels for this booke The State of France, as it stood in the IXth year of the reign of Louis XIII. (1623); An Essay on the First Book of T. Lucianus Carus de Rerum Natura. Interpreted and made English verse by J. Evelyn (1656); The Golden Book of St. John Chrysostom, containing the Lives of the Bishops of Cilicia, Translated out of the Greek by J. Evelyn; (printed 1658, dated 1659); The French Gardener: instructing how to cultivate all sorts of Fruit trees . . . (1658), translated from the French of N. de Bonneflon; A Character of England . . . (1663), a letter of the Duke of Buckingham; and a letter from a foreign observer, reprinted in Somers' Tracts (ed. Scott, 1812), and in the Horatian Miscellany (ed. Park, 1813); The Late News from Brussels unmask'd . . . (1660), in answer to a libellous pamphlet on Charles I. by Masham; Needham; or the inconvenience of the Aer and Smock of London dissipated (1661), in which he suggested that sweet-smelling trees should be planted in London to purify the air; Instructions concerning erecting of a Library . . . (1663); the French of Gabriel Naudé; Tyrannus or the Mode, in a Discourse of Sampirical Laws (1661); Sculptura: or the History and Art of Chalcography and Engraving in Copper . . . (1666); Travels of John Dower and Dr. T. Jaques to the Temple of Pomona . . . Also Kalendarium Horisoe . . . (1663); A Parallel of the Ancient Architecture with the Modern . . . (1664), from the French of Roland Freart; The History of the three late famous Improvers of Navigation, Molyneux, Pett, and Walker (1664); Padre Bevi in Antwerp (1666); Navigation and Commerce . . . in which his Majesties title to the Dominion of the Sea is asserted against the Novel and heathen powers (1664); a publication of the diary of the Dutch wars undertaken at the request of Charles II., but countermanded on the conclusion of peace; A Philosophical Discourse of Sea . . . (1676), a treatise on horticulture, better known in its later title of Terra; The Complete Gardener . . ., from the French of J. de la Quintinie; Numismata . . . (1677). Some of these were reprinted in The Miscellaneous Writings of John Evelyn, edited (1825) by William Upcott. Evelyn's friendship with Mary Wortley Montagu raised hopes of a publication of the Diary in her lifetime; but in 1724 Evelyn says he designed "to consecrate her worthy life to posterity." He effectually did it in a little masterpiece of religious biography which was published in MS. in 1847, and reprinted in 1857 under the title of The Life of Mrs Godolphin (1847). Two tales in Evelyn's Diary (1668-69), one of the most valuable work is Sylva. By the glass factories and iron furnaces the country was being rapidly depleted of wood, while no attempt was being made to replace the damage by planting. Evelyn put in a plea for afforestation, and besides producing a valuable work on arboriculture, he was able to assert in his preface to the king that he had really induced landowners to plant many millions of trees.
EVERDINGEN—EVERETT, A. H.

EVERDINGEN, ALLART VAN (1621–1675). Dutch painter and engraver, the son of a government clerk at Alkmaar, was born, it is said, in 1621, and educated, if we believe an old tradition, under Roeland Savery at Utrecht. He wandered in 1645 to Haarlem, where he studied under Peter de Molyn, and finally settled about 1657 at Amsterdam, where he remained till his death. It would be difficult to find a greater contrast than that which is presented by the works of Savery and Everdingen. Savery inherited the gaudy style of the Breughels, which he carried into the 17th century; whilst Everdingen realized the large and effective system of coloured and powerfully shaded landscape which marks the precursors of Rembrandt. It is not easy to say what Savery was to Everdingen's master, while it is quite within the range of probability that he acquired the elements of landscape painting from de Molyn. Pieter de Molyn, by birth a Londoner, lived from 1624 till 1661 in Haarlem. He went periodically on visits to Norway, and his works, though scarce, exhibit a broad and sweeping mode of execution, differing but slightly from that transferred at the opening of the 17th century from Jan van Goyen to Solomon Ruysdael. His etchings have nearly the breadth and effect of those of Everdingen. It is still an open question when de Molyn wielded influence on his clever disciple. Alkmaar, a busy trading place near the Texel, had little of the picturesque for an artist except polders and downs or waves and sky. Accordingly we find Allart at first a painter of coast scenery. But on one of his expeditions he is said to have been cast ashore in Norway, and during the repairs of his ship he visited the inland valleys, and thus gave a new course to his art. In early pieces he cleverly represents the sea in motion under varied, but mostly clouded, aspects of sky. Their general intonation is strong and brown, and effects are rendered in a powerful key, but the execution is much more uniform than that of Jacob Ruysdael. A dark scud lover, or a rolling sea near the walls of Flushing characterizes Everdingen's "Mouth of the Schelde" in the Hermitage at St. Petersburg. Storm is the marked feature of sea-pieces in the Staedel or Robartes collections; and a strand with wreckers at the foot of a cliff in the Munich Pinakotheek may be a reminiscence of personal adventure in Norway. But the Norwegian coast was studied in calms as well as in gales; and a fine canvas at Munich shows fishermen on a still and sunny day taking herring to a smoking hut at the foot of a Norwegian crag. The earliest of Everdingen's sea-pieces bears the date of 1649. After 1645 we meet with nothing but representations of inland scenery, and particularly of Norwegian valleys, remarkable alike for wildness and a decisive depth of tone. The master's favourite theme is a fall in a glen, with mournful fringes of pines interspersed with birch, and log-huts at the base of rocks and craggy slopes. The water tumbles over the foreground, so as to entitle the painter to the name of "inventor of cascades." It gives Everdingen his character as a precursor of Jacob Ruysdael in a certain form of landscape composition; but though very skilful in arrangement and clever in effects, Everdingen remains much more simple in execution; he is much less subtle in feeling or varied in a rolling sea near the walls of Flushing than his great and incomparable countryman. Five of Everdingen's cascades are in the museum of Copenhagen; alone of these, one is dated 1647, another 1649. In the Hermitage at St Petersburg is a fine example of 1647; another in the Pinakotheek at Munich was finished in 1656. English public galleries ignore Everdingen; but one of his best-known masterpieces is the Norwegian glen belonging to Lord Listowel. Of its etchings and drawings there are much larger and more numerous specimens in England than elsewhere. Being a collector as well as an engraver and painter, he brought together a large number of works of all kinds and masters; and the sale of these by his heirs at Amsterdam on the 11th of March 1676 gives an approximate clue as to the date of his painter's death.

His two brothers, Jan and Caesar, were both painters. CAESAR VAN EVERDINGEN (1666–1670), mainly known as a portrait painter, enjoyed some vogue during his life, and many of his pictures are to be seen in the museums and private houses of Holland. They show a certain cleverness, but are far from entitled to rank as a master.

EVEREST, SIR GEORGE (1790–1866), British surveyor and geographer, was the son of Tristram Everest of Gwerndale, Brecknockshire, and was born there on the 4th of July 1790. From school at Marlow he proceeded to the military academy at Woolwich, where he attracted the special notice of the mathematical master, and passed so well in his examinations that he was declared fit for a commission before attaining the necessary age. Having gone to India in 1806 as a cadet in the Bengal Artillery, he was selected by Sir Stamford Raffles to take part in the campaign of Assaye (1801–1803); and after being employed in various engineering works throughout India, he was appointed in 1818 assistant to Colonel Lambton, the founder of the great trigonometrical survey of that country. In 1823, on Colonel Lambton's death, he succeeded to the post of superintendent of the survey; in 1830 he was appointed by the court of directors of the East India Company surveyor-general of India; and from that date till his retirement from the service in 1843 he continued to discharge the laborious duties of both offices. During the rest of his life he resided in England, where he became fellow of the Royal Society and an active member of several other scientific associations. In 1861 he was made a C.B. and received the honour of knighthood, and in 1862 he was chosen vice-president of the Royal Geographical Society. He died at Greenwich on the 1st of December 1866. The geodetical labours of Sir George Everest rank among the finest achievements of their kind; and more especially his measurement of the meridional arc of India, 189° in length, is accounted as unrivalled in the annals of the science. In great part the Indian survey is what he made it.

His works are purely professional.—A paper in vol. i. of the Memoirs of the Royal Astronomical Society, pointing out a mistake in Laplace's measurement of an arc of the meridian which he had discovered during sick-leave at the Cape of Good Hope; An account of the measurement of the arc of the meridian bounded between parallels of 18° 3′ and 24° 7′, being a continuation of the Grand Meridional Arc of India, as detailed by Lieut.-Col. Lambton in the volumes of the Asiatic Society of Calcutta (London, 1830); An account of the measurement of two sections of the Meridional Arc of India bounded by the parallels of 18° 3′ 15″, 24° 7′ 11″, and 20° 30′ 48″ (London, 1847).

EVEREST, MOUNT, the highest mountain in the world. It is a peak of the Himalayas situated in Nepal almost precisely on the intersection of the meridian 87° E. long., with the parallel 28° N. lat. Its elevation as at present determined by trigonometrical observation is 29,028 ft., but it is possible that further investigation into the value of refraction at such altitudes will result in placing the summit even higher. It has been confused with a peak to the west of it called Gaurisankar (by Schlagintweit), which is more than 5000 ft. lower; but the observations of Captain Wood from peaks near Khatmandu, in Nepal, and those of the same officer, and of Major Ryder, from the route between Lhasa and the sources of the Brahmaputra in 1904, have definitely fixed the relative position of the two mountain masses, and conclusively proved that there is no higher peak than Everest in the Himalayan system. The peak possesses a distinct name, and has been called Everest after Sir George Everest (q.v.), who completed the trigonometrical survey of the Himalayas in 1841 and first fixed its position and altitude.

EVERETT, ALEXANDER HILL (1790–1847), American author and diplomatist, was born in Boston, Massachusetts, on the 19th of March 1790. He was the son of Rev. Oliver Everett (1732–1802), a Congregational minister in Boston, and the brother of Edward Everett. He graduated at Harvard in 1806, taking the highest honours of his year, though the youngest man in his class. He spent one year as a teacher in Phillips Academy, Exeter, New Hampshire, and then began the study of law in the office of John Quincy Adams. In 1809 Adams was appointed minister to Russia, and Everett accompanied him as his private secretary, remaining attached to the American legation in Russia until 1811. He was secretary of the American legation at The Hague in 1815–1816, and chargé d'affaires there.
from 1818 to 1824. From 1825 to 1829, during the presidency of John Quincy Adams, he was the United States minister to Spain. At that time Spain recognized none of the governments established by her revolted colonies, and Everett became the medium of all communications between the Spanish government and the several nations of Spanish origin which had been established, by successful revolutions, on the other side of the ocean. Everett was a member of the Massachusetts legislature in 1829 and was, in 1835, was president of Jefferson College, Louisiana. He was, in 1844, and was appointed commissioner of the United States to China in 1845, but did not go to that country until the following year, and died on the 20th of May 1847 at Canton, China. Everett, however, is known rather as a man of letters than as a diplomat. In addition to numerous articles, published chiefly in the *North American Review*, of which he was the editor from 1829 to 1835, he wrote: *Europe, or a General Survey of the Political Situation of the Principal Powers, with Conjectures on their Future Prospects* (1822), which attracted considerable attention in Europe and was translated into German, French, and Spanish; *New Ideas on Population* (1822); *America, or a General Survey of the Political Situation of the Several Powers of the Western Continent, with Conjectures on their Future Prospects* (1827), which was translated into several European languages; a volume of *Poems* (1845); and *Critical and Miscellaneous Essays* (first series, 1845; second series, 1847).

**EVERETT, CHARLES CARROLL** (1829–1900), American divine and philosopher, was born on the 19th of June 1829, at Brunswick, Maine. He studied at Bowdoin College, where he graduated in 1850, after which he proceeded to Berlin. Subsequently he took a degree in divinity at the Harvard Divinity School. From 1850 to 1860 he was pastor of the Independent Congregational (Unitarian) church at Bangor, Maine. This charge he resigned to take the Bussey professorship of theology at Harvard University, and, in 1878, became dean of the faculty of theology. Interested in a variety of subjects, he devoted himself chiefly to the philosophy of religion, and published *The Science of Thought* (Boston, 1860; revised 1891). He also wrote *Pièces de Science de la Connaissance* (1884); *Poetry, Comedy and Duty* (1888); *Religions before Christianity* (1883); *Ethics for Young People* (1894); *The Gospel of Paul* (1892). He died at Cambridge on the 26th of October 1900.

**EVERETT, EDWARD** (1794–1865), American statesman and orator, was born in Dorchester, Massachusetts, on the 11th of April 1794. He was the son of Rev. Oliver Everett and the brother of Alexander Hill Everett (q.v.). His father died in 1802, and his mother removed to Boston with her family after her husband’s death. At seventeen Edward Everett graduated from Harvard College, taking first honours in his class. While at college he was the chief editor of *The Lyceum*, the earliest in the series of college journals published at the American Cambridge. His earlier predilections were for the study of law, but the advice of Joseph Stevens Buckminster, a distinguished preacher in Boston, led him to prepare for the pulpit, and as a preacher he at once distinguished himself. He was called to the ministry of the Brattle Street church (Unitarian) in Boston before he was twenty years old. His sermons attracted wide attention in that community, and he gained a considerable reputation as a theologian and a controversialist by his publication in 1814 of a volume entitled *Defence of Christianity*, written in answer to a work, *The Grounds of Christianity Examined* (1813), by George Bethune English (1787–1828), an adventurer, who, born in Cambridge, Massachusetts, was in turn a theologian and a politician. In 1816 Everett became an editor of a newspaper, a soldier of fortune in Egypt. Everett’s tastes, however, were then, as always, those of a scholar; and in 1815, after a service of little more than a year in the pulpit, he resigned his charge to accept a professorship of Greek literature in Harvard College.

After nearly five years spent in Europe in preparation, he entered with enthusiasm on his duties, and, for five years more, gave a vigorous impulse, not only to the study of Greek, but to all the work of the college. In January 1820 he assumed the charge of the *North American Review*, which now became a quarterly; and he was indefatigable during the four years of his editorship in contributing on a great variety of subjects. From 1825 to 1835 he was a member of the National House of Representatives, supporting generally the administration of President J. Q. Adams and opposing that of Jackson, which succeeded it. He bore a part in almost every important debate, and was a member of the committee of foreign affairs during the whole time of his service in Congress. Everett was a member of nearly all the most important select committees, such as those on the Indian relations of the state of Georgia, the Apportionment Bill, and the Bank of the United States, and drew the report either of the majority or the minority. The report on the congress of Panama, the leading measure of the first session of the Nineteenth Congress, was drawn up by Everett, although he was the youngest member of the committee and had just entered Congress. He led the unsuccessful opposition to the Indian policy of General Jackson (the removal of the Cherokee and other Indians, without their consent, from lands guaranteed to them by treaty).

In 1836 he was elected governor of Massachusetts. He brought to the duties of the office the untiring diligence which was the characteristic of his public life. We can only allude to a few of the measures which received his efficient support, e.g. the establishment of the board of education (the first of such boards in the United States), the scientific surveys of the state (the first of such public surveys), the criminal law commission, and the preservation of a sound currency during the panic of 1837.

Everett filled the office of governor for four years, and was then defeated by a single vote, out of more than one hundred thousand. The election is of interest historically as being the first important American election where the issue turned on the question of the prohibition of the retail sale of intoxicating liquors. In the following spring he made a visit with his family to Europe. In 1841, while residing in Florence, he was named United States minister to Great Britain, and arrived in London to enter upon the duties of his mission at the close of that year. Great questions were at that time open between the two countries—the north-eastern boundary, the affair of M’Leod, the seizure of American vessels on the coast of Africa, in the course of a few months the affair of “the Creole,” to which was soon added theClipper question. His position was more difficult by reason of the frequent changes that took place in the department at home, which, in the course of four years, was occupied successively by Messrs Webster, Legaré, Upshur, Calhoun and Buchanan. From all these gentlemen Everett received marks of approbation and confidence.

By the institution of the special mission of Lord Ashburton, however, the direct negotiations between the two governments were, about the time of Everett’s arrival in London, transferred to Washington, though much business was transacted at the American legation in London.

Immediately after the accession of Polk to the presidency Everett was recalled. From January 1846 to 1849, as the successor of Josiah Quincy, he was president of Harvard College. On the death, in October 1852, of his friend Daniel Webster, to whom he had always been closely attached, and of whom he was always a confidential adviser, he succeeded him as secretary of state, which post he held for the remaining months of Fillmore’s administration, leaving it to go into the Senate in 1853, as one of the representatives of Massachusetts. Under the work of the long session of 1853–1854 his health gave way. In May 1854 he resigned his seat, on the orders of his physician, and retired to his estate at Lisbon, Massachusetts.

But, as proved, the remaining ten years of his life most widely established his reputation and influence throughout America. As early as 1820 he had established a reputation as an orator, such as few men in later days have enjoyed. He was frequently invited to deliver an “oration” on some topic of historical or other interest. With him these “orations,” instead of being the ephemeral entertainments of an hour, became careful studies of some important theme. Eager to avert, if possible, the impending conflict of arms between the North and South, Everett
prepared an "oration" on George Washington, which he delivered in every part of America. In this way, too, he raised more than one hundred thousand dollars, for the purchase of the old home of Washington at Mount Vernon. Everett also prepared for the Encyclopaedia Britannica a biographical sketch of Washington, which was published separately in 1860. In 1860 Everett was the candidate of the short-lived Constitutional-Union party for the vice-presidency, on the ticket with John Bell (q.v.), but received only 39 electoral votes.

During the Civil War he zealously supported the national government and was called upon in every quarter to speak at public meetings. He delivered the last of his great orations at Gettysburg, in 1863, preceding the consecration of the national cemetery there. On the 9th of January 1865 he spoke at a public meeting in Boston to raise funds for the southern poor in Savannah. At that meeting he caught cold, and the immediate result was his death on the 15th of January 1865.

In Everett's life and career was a combination of the results of diligent training, unflinching industry, delicate literary tastes and unequalled acquaintance with modern international politics. This combination made him in America an entirely exceptional person. He was never loved by the political managers; he was always enthusiastically received by assemblies of the people. He would have said himself that the most eager wish of his life had been for the higher education of his countrymen. His orations have been collected in four volumes (1850-1859). A work on international law, on which he was engaged at his death, was never finished. Allibone records 84 titles of his books and published addresses.

(E. E. H.)

EVERETT, a city of Middlesex county, Massachusetts, U.S.A., adjoining Chelsea and 3 m. N. of Boston, of which it is a residential suburb. Pop. (1880) 4159; (1890) 11,066; (1900) 24,536, of whom 6882 were foreign-born; (1910 census) 33,484. It covers an area of about 3 sq. m. and is served by the New York & Maine railroad and by interurban electric lines. Everett has the Frederick E. Parlin memorial library (1858), the Shute memorial library (1868), the Whidden memorial library and Woodawn cemetery (176 acres). The principal manufactures are coke, chemicals and boots and shoes; among others are iron and structural steel. According to the U.S. Census of Manufactures (1905), "the coke industry in Everett is unique, inasmuch as illuminating gas is the primary product and coke really a by-product, while the coal used is brought from mines located in Nova Scotia." The value of the city's total factory products increased from $4,437,180 in 1900 to $61,135,650 in 1905 or 38.9%.

Everett was the first settled part of Malden (and being known as South Malden) until 1870, when it was incorporated as a township. It was chartered as a city in 1892.

EVERETT, a city, a sub-port of entry, and the county-seat of Snohomish county, Washington, U.S.A., on Puget Sound, at the mouth of the Snohomish river, about 35 m. N. of Seattle. Pop. (1900) 7838; (1910 U. S. census) 24,814. The city is served by the Northern Pacific and the Great Northern railways, being the western terminus of the latter's main transcontinental line. Everett is a rival of Seattle. Everett is the centre of mining and quarrying, and of sawmills, flour mills, shipyards, and steel works. Everett is a film factory and a shipbuilding yard. Everett is the centre of mining and quarrying, and of sawmills, flour mills, shipyards, and steel works. Everett has a fine harbour with several large iron piers. Among its principal buildings are a Carnegie library, a Y.M.C.A. building and two hospitals. The buildings of the Pacific College were erected here by the United Norwegian Lutheran Church in 1908. The city is in a rich lumbering, gardening, farming, and copper-gold and silver-mining district. There is a U.S. assayer's office here, and there are extensive shipyards, a large paper mill, iron works, and, just outside the city limits, the smelters of the American Smelters Securities Company, in connexion with which is one of the two plants in the United States for saving arsenic from smelter fumes. Lumber interests, however, are of most importance, and here are some of the largest lumber plants in the Pacific Northwest. Red-cedar shingles are an important product. Everett was settled in 1891 and was incorporated in 1893. Its rapid growth is due to its favourable situation as a commercial port, its transportation facilities, and its nearness to extensive forests whence the material for its chief industries is obtained.

EVERGLADES, an American lake, about 8000 sq. m. in area, in which are numerous half-submerged islands; situated in the southern part of Florida, U.S.A., in Lee, De'Soto, Dade and St Lucie counties. West of it is the Big Cypress Swamp. The floor of the lake is a limestone basin, extending from Lake Okechobee in the N. to the extreme S. part of the state, and the lake varies in depth from 1 to 12 ft., its water being pure and clear. The surface is above tide level, and the lake is navigable. It is probable that it consists of a series of small interconnected lakes, rim, averaging about 10 ft. above mean low tide, and approaching much nearer to the Atlantic on the E. than to the gulf on the W. There are several small outlets, such as the Miami river and the New river on the E. and the Shark river on the S.W., but no streams empty into the Everglades, and the water-supply is furnished by springs and precipitation. There is a general south-easterly movement of the water. The soil of the islands is very fertile and is subject to frequent inundations, but gradually the water area is being replaced by land. The vegetation is luxuriant, the live oak, wild lemon, wild orange, cucumber, papaw, custard apple and wild rubber trees being among the indigenous species; there are, besides, many varieties of wild flowers, the orchids being especially noteworthy. The fauna is also varied; the otter, alligator and crocodile are found, also the deer and panther, and among the native birds are the ibis, egret, heron and limpkin. There are two seasons, wet and dry, but the climate is equable.

Systematic exploration has been prevented by the dense growth of saw grass (Cladium junniferum), a kind of sedge, with sharp, saw-toothed leaves, which grows everywhere on the muck-covered rock basin and extends several feet above the shallow water. The first white man to enter the region was Escalante de Fontenata, a Spanish captive of an Indian chief, who named the lake Laguno del Espirito Santo and the islands Cayos del Espirito Santo. Between 1841 and 1856 various United States military forces penetrated the Everglades for the purpose of attacking and driving out the Seminoles, who took refuge here. The most important explorations during the later years of the 19th century were those of Major Archie P. Williams in 1833, James E. Ingraham in 1862 and Hugh L. Whipple in 1897. The Seminole Indians were in 1909 practically the only inhabitants. In 1850 under the "Arkansas Bill," or Swamp and Overflow Act, practically all of the Everglades, which the state had been urging the federal government to drain, were returned over to the state for that purpose, with the provision that all proceeds from such lands be applied to their reclamation. A board of trustees for the Internal Improvement Fund, created in 1852 and having as members ex officio the governor, comptroller, treasurer, attorney-general and commissioner-general, sold and allowed to railway companies much of the grant. Between 1881 and 1896 a private company owning 40,000 acres of the Everglades attempted to dig a canal from Lake Okeechobee through Lake Hicopchee and along the Caloosahatchee river to the Gulf of Mexico; the company was incorporated in 1902 by overcasts. Six canals were begun under state control in 1905 from the lake to the Atlantic, the southernmost at Jensen, the southernmost at Ft. Lauderdale; the total cost, estimated at $1,035,000 for the reclamation of 12,500 sq. m., is raised by a drainage tax (not exceeding 10 cents per acre) levied by the trustees of the Internal Improvement Fund and Board of Drainage commissioners. The small area reclaimed prior to that year (1905) was found very fertile and particularly adapted to raising sugar-cane, oranges and garden truck.

See Hugh L. Whipple's Across the Everglades (Philadelphia, 1898), and especially an article "The Everglades of Florida," by Edwin A. Dix and Joseph M. MacGonigle, in the Century Magazine for February 1905.

EVERGREEN, a general term applied to plants which are always in leaf, as contrasted with deciduous trees which are bare for some part of the year (see Horticulture).
EVESTON, or IMMORTELLE, a plant belonging to the division Tagitophyllea of the natural order Compositae, known botanically as Helichrysum orientale. It is a native of North Africa, Crete, and the parts of Asia bordering on the Mediterranean, and it is cultivated in many parts of Europe. It first became known in Europe about the year 1629, and has been cultivated since 1815. In common with several other plants of the same group, known as "everlastings," the immortelle plant possesses a large involucre of dry scale-like or scarious bracts, which preserve their appearance when dried, provided the plant be gathered in proper condition. The chief supplies of Helichrysum orientale come from lower Provence, where it is cultivated in large quantities on the ground sloping to the Mediterranean, in positions well exposed to the sun, and usually in plots surrounded by dry stone walls. The larger flowers are grown on the slopes of Bandol and Ciotat, where the plant begins to flower in June. It requires a light sandy or stony soil, and is very readily injured by rain or heavy dews. It can be propagated in quantity by means of offsets from the older stems. The flowering stems are gathered in June, when the bracts are fully developed, all the fully-expanded and immature flowers being pulled off and rejected. A well-managed plantation is productive for eight or ten years. The plant is tufted in its growth, each plant producing 60 or 70 stems, while each stem produces an average of 20 flowers. About 400 such stems weigh a kilogramme. A hectare of ground will produce 11,000 plants, bearing flowers. It first produces 2,800,000 flowers, and weighing from 53 to 64 tons, or from 2 to 3 tons per acre. The colour of the bracts is a deep yellow. The natural flowers are commonly used for garlands for the dead, or plants dyed black are mixed with the yellow ones. The plant is also dyed green or orange-red, and thus employed for bouquets or other ornamental purposes.

Other species of Helichrysum and species of allied genera with scarious heads of flowers are also known as "everlastings." One of the best known is the Australian species H. bracteatum, with several varieties, including double forms, of different colours; H. vit Break (Cape of Good Hope) has white satiny heads. Others are species of Helipterum (West Australia and South Africa), Ammophium and Waitua (Australia) and Xeranthemum (south Europe). Several members of the natural order Amaranthaceae have also "everlasting" flowers; such are Gomphrena globosa, with rounded or oval heads of white, orange, rose or violet, scarious bracts, and Celosia pyramidalis, with its elegant, loose, pyramidal inflorescences. Frequently these everlasting flowers are mixed with bleached grasses, as Lagurus ovatus, Brita maxima, Bromus brisiformis, or with the leaves of the Cape silver tree (Leucodontem argenteum), to form bouquets or ornamental groups.

EVERSLEY, CHARLES SHAW LEFEVRE, VISCOUNT (1794-1888), speaker of the British House of Commons, eldest son of Mr Charles Shaw (who assumed his wife's name of Lefevre in addition to his own on his marriage), was born in London on the 22d of February 1794, and educated at Winchester and at Trinity College, Cambridge. He was called to the bar in 1819, and though a diligent student was also a keen sportsman. Marrying a daughter of Mr Samuel Whitbread, whose wife was the sister of Earl Grey, afterwards premier, he thus became connected with two influential political families, and in 1830 he entered the House of Commons as member for Downton, in the Liberal interest. In 1831 he was returned, after a severe contest, as one of the county members for Hampshire, in which he resided; and after the passing of the Reform Act of 1832 he was elected for the Northern Division of the county. For some years Mr Shaw Lefevre was chairman of a committee on agricultural distress, but as his report was not accepted by the House, he published it as a pamphlet addressed to his constituents. He acquired a high reputation in the House of Commons for his judicial fairness, combined with singular tact and courtesy, and when Mr James Abercomby retired in 1839, he was nominated as the Liberal candidate for the chair. The Conservatives put forward Henry Goulburn, but Mr Shaw Lefevre was elected by 317 votes to 290. The period was one of fierce party conflict, and the debates were frequently very acrimonious; but the dignity, temper and firmness of the new speaker were never at fault. In 1837 he had served longer than any of his predecessors in the celebrated Arthur Osmont (1691-1768), who was speaker for more than 33 years in five successive parliaments. Retiring on a pension, he was raised to the peerage as Viscount Eversley of Heckfield, in the county of Hampshire. His appearances in the House of Lords were very infrequent, but in his own county he was active in the public service. From 1859 he was an ecclesiastical commissioner, and he was also appointed a trustee of the British Museum. He died on the 28th of December 1888, the vissony becoming extinct.

His younger brother, Sir John George Shaw Lefevre (1797-1879), who was senior wrangler at Cambridge in 1818, had a long and distinguished career as a public official. He was under-secretary for the colonies, and had much to do with the introduction of the new poor law in 1834, and with the foundation of the colony of South Australia; then having served on several important commissions he was made clerk of the parliament in 1855, and in the same year became one of the first civil service commissioners. He helped to found the university of London, of which he was vice-chancellor for twenty years, and also the Athenaeum Club. He died on the 29th of August 1879.

Evesham, a market-town and municipal borough in the Evesham parliamentary division of Worcestershire, England, 107 m. W.N.W. of London by the Great Western railway, and 15 m. S.E. by E. of Worcester, with a station on the Redditch-Ashchurch branch of the Midland railway. Pop. (1901) 7101. It lies on the right (north) bank of the Avon, in the rich and beautiful Vale of Evesham. The district is devoted to market-gardening and orchards, and the trade of the town is mainly agricultural. Evesham is a place of considerable antiquity, a Benedictine house having been founded here by St Egwin in the 8th century. It became a wealthy abbey, but was almost wholly destroyed at the Dissolution. The churchyard, however, is surrounded by a Norman gateway, and there survives also a magnificent isolated bell-tower dating from 1553, of the best ornate Perpendicular workmanship. The abbey walls surround the churchyard, but almost the only remnant is a single Decorated arch. Close to the bell-tower, however, are the two parish churches of St Lawrence and of All Saints, the former of the 10th century, the latter containing Early English work, and the ornate chapel of Abbot Lichfield, who erected the bell-tower. Other buildings include an Elizabethan town hall, the grammar school, founded by Abbot Lichfield, and the picturesque
Evidence

The borough includes the parish of Bengeworth, St Peter, on the left bank of the river. Evesham is governed by a mayor, 4 aldermen and 12 councillors. Area, 2,265 acres.

Evesham (Homme, Ethonne) grew up around the Benedictine abbey, and had evidently become of some importance as a trading centre in 1055, when Edward the Confessor gave it a market and the privileges of a commercial town. It is uncertain when the town first became a borough, but the Domesday statement that the men paid 20s may indicate the existence of a more or less organized body of tradesmen. Before 1482 the burgesses were holding the town at a fee farm rent of twenty marks, but the abbot still had practical control of the town, and his steward presided over the court at which the bailiffs were chosen. After the Dissolution the manor with the markets and fairs and other privileges was granted to Sir Philip Hoby, who increased his power over the town by persuading the burgesses to agree that, after they had nominated six candidates for the office of bailiff, the steward of the court instructed by him should indicate the two to be chosen. This privilege was contested by Queen Elizabeth, but when the case was taken before the court of Exchequer it was decided in favour of Sir Philip’s heir, Sir Edward Hoby. In 1604 James I. granted the burgesses their first charter, but in the following year, by a second charter, he incorporated Evesham with the village of Bengeworth, and granted that the borough should be governed by a mayor and seven aldermen, to whom he gave the power of holding markets and fairs and several other privileges which had formerly belonged to the lord of the manor. Evesham received two later charters, but in 1688 that of 1665 was restored and still remains the governing charter of the borough. Evesham returned two members to parliament in 1265 and again in 1327, after which date the privilege lapsed until 1604. Its two members were reduced to one by the act of 1857, and the borough was disfranchised in 1885.

Evesham gave its name to the famous battle, fought on the 4th of August 1265, between the forces of Simon de Montfort, earl of Leicester, and the royalist army under Prince Edward. After a masterly campaign, in which the prince had succeeded in defeating Leicester in the valleys of the Severn and Usk, and had destroyed the forces of the younger Montfort at Kenilworth before he could effect a junction with the main body, the royalist forces approached Evesham in the morning of the 4th of August in strength, which was vastly superior to that of the English. Caught in the bend of the river Avon by the converging columns, and surrounded on all sides, the old earl attempted to cut his way out of the town to the northward. At first the fury of his assault forced back the superior numbers of the prince; but Simon’s Welsh levies melted away and his enemies closed the last avenue of escape. The final struggle took place on Green Hill, a little to the north-west of the town, where the devoted friends of de Montfort formed a ring round their leader, and died with him. The spot is marked with an obelisk.

Evidence (Lat. evidens, evido, to appear clearly), a term which may be defined briefly as denoting the facts presented to the mind of a person for the purpose of enabling him to decide a disputed question. Evidence in the widest sense includes all such facts, and reference may be made to the article Logic for the science or art of dealing with the proper way of drawing correct conclusions and the nature of proof. In a narrower sense, however, evidence includes in English law only such facts as are allowed to be so presented in the course of judicial proceedings. Thus we say that a fact is not evidence, meaning thereby that it is not admissible as evidence in accordance with the rules of law. The legal evidence is part of the law of procedure. It determines the rules of evidence under which a fact may be produced in judicial proceedings, and regulates the mode in which, and the conditions under which, evidence may be produced and tested.

The English law of evidence is of comparatively modern growth. It enshrines certain maxims, some derived from Roman law, some invented by Coke, who, as J. B. Thayer says, “spawned Latin maxims freely.” But for the most part it was built up by English judges in the course of the 18th century, and consists of this judge-made law, as modified by statutory enactments of the 19th century. Early Teutonic procedure knew nothing of evidence in the modem sense, just as it knew nothing of trials in the modern sense. What it knew was “proofs.” There were two modes of proof, ordeals and oaths. Both were appeals to the supernatural. The judicial combat was a bilateral ordeal. Proof followed, instead of preceding, judgment. A judgment of the court, called by German writers the Beweisurteif., and by M. M. Bigelow the “medial judgment,” awarded that one of the two litigants must prove his case, by his body in battle, or by a one-sided ordeal, or by an oath with oath-helpers, or by the oaths of witnesses. The court had no desire to hear or weigh conflicting testimony. To do so would have been to exercise critical faculties, which the court did not possess, and the exercise of which would have been foreign to the whole spirit of the age. The litigant upon whom the burden of furnishing proof was imposed had a certain task to perform. If he performed it, he won; if he failed, he lost. The number of oath-helpers varied in different cases, and was determined by the law or by the court. They were probably, at the outset, kinsmen, who would have had to take up the blood-feud. At a later stage they became witnesses to character. In the cases, comparatively rare, where the oaths of witnesses were admitted as proof, their oaths differed materially from the sworn testimony of modern courts. As a rule no one could testify to a fact unless, when the fact happened, he was solemnly “taken to witness.” Then, when the witness was adduced, he came merely to swear to a set formula. He did not make a promising oath to answer questions truly. He merely made an asseritory oath in a prescribed form.

In the course of the 12th and 13th centuries the old formal accusatory procedure began to break down, and to be succeeded by another form of procedure known as inquisitio, inquest, or enquête. Its decay was hastened by the decree of the fourth Lateran Council in 1215, which forbade ecclesiastics to take part in ordeals. The Norman administrative system introduced into England by the Conquest was familiar with a method of ascertaining and determining facts by means of a verdict, return or finding made on oath by a body of men drawn from the locality. The system may be traced to Carolingian, and even earlier, sources. Henry II., by instituting the grand assize and the lesser assizes at the disposal of the king, would have incorporated the opportunity of giving proof by the verdict of a sworn inquest of neighbours, proof “by the country.” The system was gradually extended to other cases, criminal as well as civil. The verdict given was that of persons having a general, but not necessarily a particular, acquaintance with the persons, places and facts to which the inquiry related. It was, in fact, a finding by local popular opinion. Had the finding of such an inquest been treated as final and conclusive in criminal cases, English criminal procedure might, like the continental inquisition, the French enquête, have taken the path which, in the forcible language of Fortescue (De laudibus, &c.) “leads to hell” (serm on āspā est ad gehennam). Fortunately English criminal procedure took a different course. The spirit of the old accusatory procedure was applied to the new procedure by inquest. In serious cases the words of the jurors, the accusing jurors, were treated not as testimony, but as accusation, the new indictment was treated as corresponding to the old appeal, and the preliminary finding by the accusing jury had to be supplemented by the verdict of another jury. In course of time the second jury were required to base their findings not on their own knowledge, but on evidence submitted to them. Thus the modern system of indictment, grand jury and trial by petty jury was gradually developed.

A few words may here be said about the parallel development of criminal procedure on the continent of Europe. The tendency in the 12th and 13th centuries to abolish the old formal methods of procedure, and to give the new procedure the name of inquisition or inquest, was not peculiar to England. Elsewhere the old procedure was breaking down at the same time, and for similar reasons. It was the great pope Innocent III., the pope
of the fourth Lateran Council, who introduced the new inquisitorial procedure into the canon law. The procedure was applied to cases of heresy, and, as so applied, especially by the Dominicans, speedily assumed the features which made it infamous. Every safeguard of innocence was abolished or disregarded; torture was freely used. Everything seems to have been done to secure a conviction. Yet, in spite of its monstrous defects, the inquisitorial procedure of the ecclesiastical courts, secret in its methods, unfair to the accused, having torture as an integral element, gradually forced its way into the temporal courts, and may almost be said to have been adopted by the common law of western Europe. In connexion with this inquisitorial procedure continental jurists elaborated a theory of evidence, or judicial proofs, which formed the subject of an extensive literature. Under the rules thus evolved full proof (plena probatio) was essential for conviction, in the absence of confession, and the standard of full proof was fixed so high that it was in most cases unattainable. It therefore became material to obtain confession by some means or other. The most effective means was torture, and thus torture became an essential feature in criminal procedure. The rules of evidence attempted to graduate the weight to be attached to different kinds of testimony and almost to estimate that weight in numerical terms.

"Le parlement de Toulouse," said Voltaire, "a un usage très singulier dans les peuples par témoins. On admettait les demi-prêtres, mais à Toulouse on admet des quarts et des demi-huitièmes de preuves." Modern continental procedure was grounded on the idea that the different features of inquisitorial procedure, and has shaken itself free from the trammels imposed by the old theory and technical rules of proof. But in this, as in other branches of law, France seems to have paid the penalty for having been first in the field with codification by lagging behind in material reforms. The French Code of Criminal Procedure was largely based on Colbert's Ordonnance of 1670, and though embodying some reforms, and since amended on certain points, still retains some of the features of the un-reformed procedure which was condemned in the 18th century by Voltaire and the philosopher. Military procedure is in the rear of civil procedure, and the trial of Captain Dreyfus at Rennes in 1899 presented some interesting archaisms. Among these were the weight attached to the rank and position of witnesses as compared with the intrinsic character of their evidence, and the extraordinary importance attributed to confession even when made under suspicious circumstances and supported by flimsy evidence.

The history of criminal procedure in England has been traced by Sir James Stephen. The modern rules and practice as to evidence and witnesses in the common law courts, both in civil and in criminal cases, appear to have retained in them much of the 18th century. The first systematic treatise on the English law of evidence appears to have been written by Chief Baron Gilbert, who died in 1726, but whose Law of Evidence was not published until 1751. In writing it he is said to have been much influenced by Locke. It is highly praised by Blackstone as "a work which it is impossible to abstract or abridge without losing some beauty and destroying the charm of the whole"; but Bentham, who rarely agrees with Blackstone, speaks of it as running throughout "in the same strain of anality, garrulity, narrow-mindedness, absurdity, perpetual misrepresentation and indefatigable self-prolongation." In any case it remained the standard authority on the law of evidence throughout the remainder of the 18th century. Bentham wrote his Rationale of Judicial Evidence, specially applied to English Practice, at various times between the years 1802 and 1812.

By this time he had lost the nervous and simple style of his youth, and required an editor to make him readable. His great interpreter, Dumont, condensed his views on evidence into the Traité des preuves judiciaires, which was published in 1823. The manuscript of the Rationale was edited for English readers and to a great extent rewritten, by J. S. Mill, and was published in five volumes in 1827. The book had a great effect both in England and on the continent. The English version, though crabbed and artificial in style, and unmeasured in its invective, is a storehouse of comments and criticisms on the principles of evidence and the practice of the courts, which are always shrewd and often profound. Bentham examined the practice of the courts by the light of practical utility. Starting from the principle that the object of judicial evidence is the discovery of truth, he condemned the rules which excluded some of the best sources of evidence. The most characteristic feature of the common-law rules of evidence was, as Bentham pointed out, and, indeed, still is, their exclusionary character. They excluded and prohibited the use of certain kinds of evidence which would be used in ordinary inquiries. In particular, they disqualified certain classes of witnesses on the ground of interest in the subject-matter of the inquiry, instead of treating the interest of the witness as a matter affecting his credibility. It was against this confusion between competency and credibility that Bentham directed his principal attack. He also attacked the system of paper evidence, evidence by means of affidavits or oaths, instead of by oral testimony in court, which prevailed in the court of chancery, and in ecclesiastical courts. Subsequent legislation has endorsed his criticisms. The Judicature Acts have reduced the use of affidavits in chancery proceedings within reasonable limits. A series of acts of parliament have removed, step by step, almost all the disqualifications which formerly made certain witnesses incompetent to testify.

Before Bentham's work appeared, an act of 1814 had removed the incompetency of ratepayers as witnesses in certain cases relating to parishes. The Civil Procedure Act 1833 enacted that a witness should not be objected to as incompetent, solely on the ground that the verdict or judgment was not given in evidence for or against him. An act of 1840 removed some doubts as to the competency of ratepayers to give evidence in matters relating to their parish. The Evidence Act 1843 enacted broadly that witnesses should not be excluded from giving evidence by reason of incapacity from crime or interest. The Evidence Act 1851 made parties to legal proceedings admissible witnesses subject to a proviso that "nothing herein contained shall render any person who in any criminal proceeding is charged with the commission of any indictable offence, or any offence punishable on summary conviction, competent to give evidence in the proceedings in which he is accused of having committed the offence, or shall render any person compellable to answer any question tending to criminate himself or herself, or shall in any criminal proceeding render any husband competent or compellable to give evidence for or against his wife, or any wife competent or compellable to give evidence for or against her husband." The Evidence (Scotland) Act 1853 made a similar provision for Scotland. The Evidence Amendment Act 1853 made the husbands and wives of parties admissible witnesses, except that husbands and wives could not give evidence for or against each other in criminal proceedings or in proceedings for bankruptcy, and could not be compelled to disclose communications made to each other during marriage. Under the Matrimonial Causes Act 1857 the petitioner can be examined and cross-examined on oath at the hearing, but is not bound to answer any question tending to show that he or she has been guilty of adultery. Under the Matrimonial Causes Act 1859, on a wife's petition for dissolution of marriage on the ground of adultery coupled with cruelty or desertion, husband and wife are competent and compellable to give evidence as to the cruelty or desertion. The Crown Suits Act 1865 declared that revenue proceedings were not to be regarded as criminal, and the rules of evidence of the acts of 1851 and 1853. The Evidence Further Amendment Act 1869 declared that parties to actions for breach of promise of marriage
were competent to give evidence in the action, subject to a proviso that the plaintiff should not recover unless his or her testimony was corroborated by some other material evidence. It also made the parties to proceedings instituted in consequence of adultery, and their husbands and wives, competent to give evidence, but a witness in any such proceeding, whether for or not, is not to be liable to be asked or bound to answer any question tending to show that he or she has been guilty of adultery, unless the witness has already given evidence in the same proceeding in disproof of the alleged adultery. There are similar provisions applying to Scotland in the Conjugal Rights (Scotland) Amendment Act 1861, and the Evidence Further Amendment (Scotland) Act 1874. The Evidence Act 1877 enacts that "on the trial of any indictment or other proceeding for the non-repair of any public highway or bridge, or for a nuisance to any public highway, river, or bridge, and of any other indictment or proceeding instituted for the purpose of trying or enforcing a civil right only, every defendant to such indictment or proceeding, and the wife or husband of any such defendant shall be admissible witnesses and compilable to give evidence." From 1872 onwards numerous enactments were passed making persons charged with particular offences, and their husbands and wives, competent witnesses. The language and effect of these enactments were not always the same, but the insertion of some provision to this effect in an act creating a new offence, especially if it was punishable by summary proceedings, gradually became almost a common form in legislation. In the year 1874 a bill to generalize these particular provisions, and to make the evidence of persons charged with criminal offences admissible in all cases was introduced by Mr. Gladstone's government, and was passed by the standing committee of the House of Commons. During the next fourteen years bills for the same purpose were repeatedly introduced, either by the government of the day, or by Lord Bramwell as an independent member of the House of Lords. Finally the Criminal Evidence Act 1898, introduced by Lord Halsbury, has enacted in general terms that "every person charged with an offence, and the wife or husband, as the case may be, of the person so charged, shall be a competent witness for the defence at every stage of the proceedings, whether the person so charged is charged solely or jointly with any other person." But this general enactment is qualified by some special restrictions, the nature of which will be noticed below. The act applies to Scotland but not to Ireland. It was not to apply to proceedings in courts-martial unless so applied by general orders or rules made under statutory authority. The provisions of the act have been applied by rules to military courts-martial, but have not yet been applied to naval courts-martial. The removal of disqualifications for want of religious belief is referred to below under the head of "Witnesses."

The act of 1898 finishes for the present the history of English legislation on evidence. For a view of the legal literature on the subject it is necessary to take a step backwards. Early in the 19th century Chief Baron Gilbert was succeeded as an authority on the English law of evidence by the works of Phillips (1814) and Starkie (1824), who were followed by Roscoe (Nisi Prius, 1827; Criminal Cases, 1835), Greenleaf (American, 1842), Taylor (based on Greenleaf, 1848), and Best (1849). In 1883 the Rules of the Common Bench, Stephen's Commentary on the Law of Evidence, based upon the Indian Evidence Act 1872, which he had prepared and passed as law member of the council of the governor-general of India. This Digest obtained a rapid and well-deserved success, and has materially influenced the form of subsequent writings on the English law of evidence. It sifted out what Stephen conceived to be the main rules of evidence from the numerous masses in which they had been bedded. Roscoe's Digest tells the law in such a way that things must be proved in order to sustain particular actions or criminal charges, and related as much to pleadings and to substantive law as to evidence. Strictly speaking, there were a very great mass of useful information, but his book was one to consult, not to master. Stephen eliminated much of this extraneous matter, and summed up his rules in a series of succinct propositions, supplemented by apt illustrations and examples. It is hard to believe that they could be read and remembered. Hence the English Digest, like the Indian Act, has been of much educational value. Its most original feature, but unfortunately also its weakest point, is its theory of relevancy. Pondering the multitude of "exclusionary" rules which had been laid down by the English courts, Stephen, with characteristic knowledge, had discovered the original general principle on which those rules rested, and could devise a formula by which the principle could be expressed, "My study of the subject," he says, "both practically and in books has convinced me that the doctrine that all facts not connected with the issue, and no others, may be, is the unexpressed principle which forms the centre of and gives unity to all the express negative rules which form the great mass of the law." The result was the well-known rule on the relevancy of facts in the Indian Evidence Act, and the definition of relevancy in s. 7 of that act. This definition was based on the view that a distinction could be drawn between things which were admissible evidence, and things which were not. The former were things so connected with each other, and that relevancy depended on causal connection. Subsequent criticism convinced Stephen that his definition was in some respects too narrow and in others too wide, and eventually he adopted what is now a definition which is restricted so as to drop out even in their amended form the provisions about relevancy are open to serious criticism. The doctrine of relevancy, i.e. of the probative effect of facts, is a branch of logic, not of law, and is out of place in the form which it has taken. The object of the provision of the Indian Evidence Act to be made legal rules square with a preconceived theory has often made the language and arrangement artificial, and the work, in spite of its compression, still contains rules which, under a more scientific treatment, would find their appropriate place in the branches of the law. These defects are characteristic of a strong and able man, who saw clearly, and expressed forcibly what he did see, and who did not ignore or deny the existence of what he did not see, whose mind was vigorous, and yet original, and who, in spite of his learning, was somewhat deficient in the historical sense. But notwithstanding these defects, the comprehensiveness of the author, his learning, and his practical experience, especially in criminal cases, attach greater weight to FitzJames Stephen's statements than to those of any other English writer on the law of evidence.

The object of every trial is, or may be, to determine two classes of questions or issues, which are usually distinguished as questions of law, and questions of fact, although the distinction between them is not so clear as might appear on a superficial view. In a trial by jury these two classes of questions are answered by different persons. The judge lays down the law. The jury, under the guidance of the judge, find the facts. It was with reference to trial by jury that the English rules of evidence were originally framed; it is by the peculiarities of this form of trial that many of them are to be explained; it is to this form of trial alone that some of the most important of them are exclusively applicable. The negative, exclusive, or exclusionary rules which form the characteristic features of the English law of evidence, are the rules in accordance with which the judge guides the jury. There is no difference of principle between the method of inquiry in judicial and in non-judicial proceedings. In either case a person who wishes to find out whether a particular event did or did not happen, tries, in the first place, to obtain information from persons who may have seen and heard what happened (direct evidence), and, failing this, to obtain information from persons who can tell him about facts from which he can draw an inference as to whether the event did or did not happen (indirect evidence). But in judicial inquiries the information given must be given on oath, and be liable to be tested by cross-examination. And there are rules of law which exclude from the consideration of the jury certain classes of facts which, in an ordinary inquiry, would, or might, be taken into consideration. Facts so excluded are said to be "not admissible as evidence," or "not evidence." According
as the word is used in the wider or in the narrower sense. And
the easiest way of determining whether a fact is or is not evidence
in the narrower sense, is first to consider whether it has any
bearing on the question to be tried, and, if it has, to consider
whether it falls within any one or more of the rules of exclusion
laid down by English law. These rules of exclusion are peculiar
to English law and to systems derived from English law. They
have been much criticized, and some of them have been repealed
or materially modified by legislation. Most of them may be
traced to directions given by a judge in the course of trying a
particular case, given with special reference to the circumstances
of that case, but expressed in general language, and, partly
through the influence of text-writers, eventually hardened into
general rules. In some cases their origin is only intelligible by
reference to obsolete forms of pleading or practice. But in most
cases they were originally rules of convenience laid down by the
judge for the assistance of the jury. The judge is a man of trained
experience, who has to arrive at a conclusion with the help of
twelve untrained men, and who is naturally anxious to keep them
straight, and give them every assistance in his power. The
exclusion of certain forms of evidence assists the jury by con-
centrating their attention on the points connected with them, and
by preventing them from being distracted or be-
wilder ed by facts which either have no bearing on the question
before them, or have no remote bearing on those questions as
be to be practically useless as guides to the truth. It also prevents a
jury from being misled by statements the effect of which, through
the prejudice they excite, is out of all proportion to their true
weight. In this respect the rules of exclusion may be compared
to blinkers, which keep a horse’s eyes on the road before him.
In criminal cases the rules of exclusion secure fair play to the
accused, because he comes to the trial prepared to meet a specific
charge, and ought not to be suddenly confronted by statements
which he had no reason to expect would be made against him.
They protect absent persons against statements affecting their
character. And lastly they prevent the infinite waste of time
which would ensue in the discussion of a question of fact if an
inquiry were allowed to branch out into all the subjects with
which that fact is more or less connected. The purely practical
grounds on which the rules are based, according to the view of
a great judge, may be illustrated by some remarks of Mr Justice
Willes (1814-1872). In discussing the question whether evi-
dence of the plaintiff’s conduct on other occasions ought to be
admitted, he said—

"It is not easy in all cases to draw the line and to define with
accuracy where probability ceases and speculation begins; but
we are bound to lay down the rule to the best of our ability. No
doubt the rule as to confining the evidence to that which is relevant
and material is one of great importance, not only with
regards to the particular case, but also with reference to saving
the time of the court, and preventing the minds of the jury from being
drawn away from the real point they have to decide.... Now it
appears to me that the evidence proposed to be given in this case,
if admitted, would not have shown that it was more probable that
the contract was subject to the condition insisted upon by the
defendant. The question may be put thus, Does the fact of a person
having once or many times in his life done a particular act in a
particular way make it more probable that he has done the same
thing in the same way upon another and different occasion? To
answer this question, I think, he might be found guilty of the
evidence that has been led. There may be great danger.... If such evidence were held admissible it would
be difficult to say that the defendant might not in any case, where
the question was whether or not there had been a sale of goods on
credit, call witnesses to prove that the plaintiff had dealt with
other persons upon a certain credit; or, in an action for an assault, that
the plaintiff might not give evidence of former assaults committed
by the defendant upon other persons, or upon other persons of a
particular class, for the purpose of showing that he was a quarrelsome
individual, and therefore that it was highly probable that the
particular charge of assault was well founded. The extent to which
this sort of thing may be carried is not determinable. It is difficult
to adhere to the prejudices, the injustice, and the waste of time to which
the admission of such evidence would lead, and bearing in mind the
extent to which it might be carried, and that litigants are mortal,
it is not safe to adhere to the rule and so to lay it down with
strictness. I think, therefore, the fact that the plaintiff had entered
into contracts of a particular kind with other persons on other
occasions could not be properly admitted in evidence where no
custom of trade to make such contracts, and no connexion between
such and the one in question, was shown to exist."

(Hollinger v. Head, 1855, 4 C.B. N.S. 388).

There is no difference between the principles of evidence in
civil and in criminal cases, although there are a few special rules,
such as those relating to confessions and to dying declarations,
which are only applicable to criminal proceedings. But in civil
cases the issues are narrowed by mutual admissions of the
parties, so that evidence taken out of court, such as affidavits, and,
generally, the rules of evidence are less strictly
applied. It is often impolitic to object to the admission
evidence, even when the objection may be sustained by previous
rulings. The general tendency of modern procedure is to place
a more liberal and less technical construction on rules of evidence,
especially in civil cases. In recent volumes of law reports cases
turning on the admissibility of evidence are conspicuous by their
rarity. Various causes have operated in this direction. One of
them has been the change in the system of pleading, under which
the prejudice they excite, is out of all proportion to their true
weight. In this respect the rules of exclusion may be compared
to blinkers, which keep a horse’s eyes on the road before him.
In criminal cases the rules of exclusion secure fair play to the
accused, because he comes to the trial prepared to meet a specific
charge, and ought not to be suddenly confronted by statements
which he had no reason to expect would be made against him.
They protect absent persons against statements affecting their
character. And lastly they prevent the infinite waste of time
which would ensue in the discussion of a question of fact if an
inquiry were allowed to branch out into all the subjects with
which that fact is more or less connected. The purely practical
grounds on which the rules are based, according to the view of
a great judge, may be illustrated by some remarks of Mr Justice
Willes (1814-1872). In discussing the question whether evi-
dence of the plaintiff’s conduct on other occasions ought to be
admitted, he said—

"It is not easy in all cases to draw the line and to define with
accuracy where probability ceases and speculation begins; but
we are bound to lay down the rule to the best of our ability. No
doubt the rule as to confining the evidence to that which is relevant
and material is one of great importance, not only with
regards to the particular case, but also with reference to saving
the time of the court, and preventing the minds of the jury from being
drawn away from the real point they have to decide.... Now it
appears to me that the evidence proposed to be given in this case,
if admitted, would not have shown that it was more probable that
the contract was subject to the condition insisted upon by the
defendant. The question may be put thus, Does the fact of a person
having once or many times in his life done a particular act in a
particular way make it more probable that he has done the same
thing in the same way upon another and different occasion? To
answer this question, I think, he might be found guilty of the
evidence that has been led. There may be great danger.... If such evidence were held admissible it would
be difficult to say that the defendant might not in any case, where
the question was whether or not there had been a sale of goods on
credit, call witnesses to prove that the plaintiff had dealt with
other persons upon a certain credit; or, in an action for an assault, that
the plaintiff might not give evidence of former assaults committed
by the defendant upon other persons, or upon other persons of a
particular class, for the purpose of showing that he was a quarrelsome
individual, and therefore that it was highly probable that the
particular charge of assault was well founded. The extent to which
this sort of thing may be carried is not determinable. It is difficult
to adhere to the prejudices, the injustice, and the waste of time to which
the admission of such evidence would lead, and bearing in mind the
extent to which it might be carried, and that litigants are mortal,
it is not safe to adhere to the rule and so to lay it down with
strictness. I think, therefore, the fact that the plaintiff had entered
into contracts of a particular kind with other persons on other
occasions could not be properly admitted in evidence where no
...
was settled by Fox's Libel Act 1792. Coke's maxim describes
in a broad general way the distinction between the functions of
the judge and of the jury, but is only true subject to important
qualifications. Judges in jury cases constantly decide what may
be properly called questions of fact, though their action is
often disguised by the language applied or the procedure em-
ployed. Juries, in giving a general verdict, often practically
take to actions at law hands. The border-line between the
two classes of questions is indicated by the "mixed questions
of law and fact," to use a common phrase, which arise in such
cases as those relating to "necessaries," "due diligence," "negli-
gence," "reasonableness," "reasonable and probable
cause." In the treatment of these cases the line has been drawn
differently at different times, and two conflicting tendencies are
discernible. On the one hand, there is the natural tendency
to generalize common inferences into legal rules, and to fix legal
standards of duty. On the other hand, there is the sound instinct
that it is a mistake to define and refine too much in these cases,
and that the better course is to leave broadly to the jury, under
the general guidance of the judge, the question what would be
done by the "reasonable" or "prudent" man in particular
cases. The latter tendency predominates in modern English
law, and is reflected by the enactments in the recent acts codify-
ing the law on bills of exchange and sale of goods, that certain
questions of reasonableness are to be treated as questions of
fact. On the same ground rests the dislike to limit the right of
a jury to give a general verdict in criminal cases. Questions of
custom begin by being questions of fact, but as the custom obtains
general recognition it becomes law. Many of the rules of the
English mercantile law were "found" as customs by Lord
Mansfield's special juries. Generally, it must be remembered
that the jury act in subordinate co-operation with the judge,
and that the extent to which the judge limits or encroaches on
the province of the jury is apt to depend on the personal idiosyn-
crasy of the judge.

2. Judicial Notice.—It may be doubted whether the subject
of judicial notice belongs properly to the law of evidence, and
whether it does not belong rather to the general topic of legal
or judicial reasoning. Matters which are the subject of judicial
notice are part of the equipment of the judicial mind. It would
be absurd to require evidence of every fact; many facts must
be assumed to be known. The judge, like the juryman, is sup-
posed to bring with him to the consideration of the question
which he has to try common sense, a general knowledge of
human nature and the ways of the world, and also knowledge
of things that "everybody is supposed to know." Of such matters
judicial notice is said to be taken. But the range of general
knowledge is indefinite, and the range of judicial notice has, for
reasons of convenience, been fixed or extended, both by rulings
of the judges and by numerous enactments of the legislature.
It would be impossible to enumerate here the matters of which
judicial notice must or may be taken. These are to be found
in the text-books. For present purposes it must suffice to say
that they include not only matters of fact of common and certain
knowledge, but the law and practice of the courts, and many
matters connected with the government of the country.

3. Presumptions.—A presumption in the ordinary sense is an
inference. It is an argument, based on observation, that what
has happened in some cases will probably happen in others of the
like nature. The subject of presumptions, so far as they are
mere inferences or arguments, belongs, not to the law of evidence,
or to the law at all, but to the rules of reasoning. But a legal presum-
position, or, as it is sometimes called, a presumption of law, as dis-
tinguished from a presumption of fact, is something more. It
may be described, in Stephen's language, as "a rule of law that
courts and judges shall draw a particular inference from a
particular fact, or from particular evidence, unless and until the
truth" (perhaps it would be better to say "soundness") "of the inference is disproved." Courts and legislatures have laid
down such rules on grounds of public policy or general con-
venience, and the rules have then to be observed as rules of
positive law, not merely used as part of the ordinary process of
reasoning or argument. Some so-called presumptions are rules
of substantive law under a disguise. To this class appear to
belong "conclusive presumptions of law," such as the common-
law presumption that a child under seven years of age cannot
commit a felony. So again the presumption that every one
knows the law is merely an awkward way of saying that ignorance
of the law is not a legal excuse. For while the sole true legal
presumptions, the majority may be dealt with most appropriately
under different branches of the substantive law, such as the law
of crime, of property, or of contract, and accordingly Stephen
has included in his Digest of the Law of Evidence only some which
are common to more than one branch of the law. The effect
of a presumption is to impute to certain facts or groups of facts
a prima facie significance or operation, and thus, in legal pro-
ceedings, to throw upon the party against whom it works the
duty of bringing forward evidence to meet it. Accordingly
the subject of presumptions is intimately connected with the subject
of the burden of proof, and the same legal rule may be expressed
in different forms, either as throwing the advantage of a presump-
tion on one side, or as throwing the burden of proof on the other.
Thus the rule in Stephen's Digest, which says that the burden of
proving that any person has been guilty of a crime or wrongful
act is on the person who asserts it, appears in the article entitled
"Presumption of Innocence." Among the more ordinary and
more important legal presumptions are the presumption of
regularity in proceedings, described generally as a presumption
omnis acta rite acta, and including the presumption that the
holder of a public office has been duly appointed, and has duly
performed his official duties, the presumption of the legitimacy
of a child born during the mother's marriage, or within the
period of gestation after her husband's death, and the presump-
tions as to life and death. "A person shown not to have been
heard of for seven years by those (if any) who, if he had been
alive, would naturally have heard of him, is presumed to be dead
unless the circumstances of the case are such as to account for
his not being heard of without assuming his death; but there is
no presumption as to the time when he died, and the burden of
proving his death at any particular time is upon the person who
asserts it. There is no presumption" (i.e. legal presumption)
"as to the age at which a person died who is shown to have been
alive at a given time, or as to the order in which two or more
persons died who are shown to have died in the same accident,
shipwreck or battle" (Stephen, Dig., art. 90). A document
proved or purporting to be thirty years old is presumed to be
genuine, and to have been properly executed and (if necessary)
attested if produced from the proper custody. And the legal
presumption of a "lost grant," i.e. the presumption that a right
or alleged right which has been long enjoyed without interrup-
tion had a legal origin, still survives in addition to the common
law and statutory rules of prescription

4. Burden of Proof.—The expression onus probandi has come
down from the classical Roman law, and both it and the Roman
maxims, Agenti incumbit probatio, Necessitas probandi incumbit
ei qui dicit non ei qui negat, and Reus exipiendo fit actus, must
be read with reference to the Roman system of actions, under
which nothing was admitted, but the plaintiff's case was tried
first; then, unless that failed, the defendant's on his exceptio;
then, unless that failed, the plaintiff's on his replicatio, and so
on. Under such a system the burden was always on the" actor." In
modern law the phrase "burden of proof" may mean one of
two things, which are often confused—the burden of establish-
ing the proposition, or the burden of producing evidence on any particular point either at the
beginning or at a later stage of the case. The burden in the
former sense ordinarily rests on the plaintiff or prosecutor. The
burden in the latter sense, that of going forward with evidence
on a particular point, may shift from side to side as the case
proceeds. The general rule is that he who alleges a fact must
prove it, whether the allegation is couched in affirmative
or negative terms. But this rule is subject to the effect of presump-
tions in particular cases, to the principle that in considering
the amount of evidence necessary to shift the burden of proof regard
must be had to the opportunities of knowledge possessed by the parties respectively, and to the express provisions of statutes directing where the burden of proof is to lie in particular cases. Thus many statutes expressly direct that the proof of lawful excuse or authority, or the absence of fraudulent intent, is to lie on the person charged with an offence. And the Summary Jurisdiction Act 1848 provides that if the information or complaint in summary proceedings negatives any exemption, exception, proviso, or condition in the statute on which it is founded, the prosecutor or complainant need not prove the negative, but the defendant may prove the affirmative in his defence.

II. Classes of Evidence

Evidence is often described as being either oral or documentary. To these two classes should be added a third, called by Bentham real evidence, and consisting of things presented immediately to the senses of the judge or the jury. Thus the judge or jury may go to view any place the sight of which may help to an understanding of the evidence, and may inspect anything sufficiently identified and produced in court as material to the decision. Weapons, clothes and things alleged to have been stolen or damaged are often brought into court for this purpose. Oral evidence consists, as its name implies, of statements of witnesses. Documentary evidence consists of documents submitted to the judge or jury by way of proof. The distinction between primary and secondary evidence relates only to documentary evidence, and will be noticed in the section under that head. A division of evidence from another point of view is that into direct and indirect, or, as it is sometimes called, circumstantial evidence. By direct evidence is meant the statement of a person who saw, or otherwise observed with his senses, the fact in question. By indirect or circumstantial evidence is meant evidence of facts from which the fact in question may be inferred. The difference between direct and indirect evidence is a difference of kind, not of degree, and therefore the rule or maxim as to “best evidence” has no application to it. Juries naturally attach more weight to direct evidence, and in some legal systems it is only this class of evidence which is allowed to have full probative force. In some respects indirect evidence is superior to direct evidence, because, as Paley puts it, “facts cannot lie,” whilst witnesses can and do. On the other hand facts often deceive; that is to say, the inferences drawn from them are often erroneous. The circumstances in which crimes are ordinarily committed are such that direct evidence of their commission is usually not obtainable, and when criminality depends on a state of mind, such as intention, that state must necessarily be inferred by means of indirect evidence.

III. Rules of Exclusion

It seems desirable to state the leading rules of exclusion in their crude form instead of obscuring their historical origin by attempting to force them into the shape of precise technical propositions forming parts of a logically connected system. The judges who laid the foundations of our modern law of evidence, like those who first discussed on the duties of trustees, little dreamt of the elaborate and artificial system which was to be based upon their remarks. The rules will be found, as might be expected, to be vague, to overlap each other, to require much explanation, and to be subject to many exceptions. They may be stated as follows:—(1) Facts not relevant to the issue cannot be admitted as evidence. (2) The evidence produced must be the best obtainable under the circumstances. (3) Hearsay is not evidence. (4) Opinion is not evidence.

1. Rule of Relevancy.—The so-called rule of relevancy is sometimes stated by text-writers in the form in which it was laid down by Baron Parke in 1837 (Wright v. Doe and Tubham, 7 A. and E. 384), when he described “one great principle” in the law of evidence as being that “all facts which are relevant to the issue may be proved.” Stated in different forms, the rule has been made by FitzJames Stephen the central point of his theory of evidence. But relevancy, in the proper and natural sense, as we have said, is a matter not of law, but of logic. If Baron Parke’s dictum relates to relevancy in its natural sense it is not true; if it relates to relevancy in a narrowed and artificial sense, as equivalent to admissible, it is tautological. Such practical importance as the rule of relevancy possesses consists, not in what it includes, but in what it excludes, and for that reason it seems better to state the rule in a negative or exclusive form. But whether the rule is stated in a positive or in a negative form its vagueness is apparent. No precise line can be drawn between “relevant” and “irrelevant” facts. The two classes shade into each other by imperceptible degrees. The broad truth is that the courts have excluded from consideration certain matters which, having some bearing on the question to be decided, and which, in that sense, are irrelevant, and that they have done it on grounds of policy and convenience. Among the matters so excluded are matters which are likely to mislead the jury, or to complicate the case unnecessarily, or which are of slight, remote, or merely conjectural importance. Instances of the classes of matters so excluded can be given, but it seems difficult to refer their exclusion to any more general principle than this. Rules as to evidence of character and conduct appear to fall under this principle. Evidence is not admissible to show that the person who is alleged to have done a thing was of a disposition or character which makes him more or less likely to do it. Or how it was done. This rule excludes the biological account of the prisoner which are so familiar in French trials, and is an important principle in English trials. It is subject to three exceptions:—first, that evidence of good character is admissible in favour of the prisoner in all criminal cases; secondly, that a prisoner indicted for rape is entitled to call evidence as to the immoral character of the prosecutrix; and thirdly, that a witness may be called to say that he would not believe a previous witness on his oath. The exception allowing the good character of a prisoner to influence the verdict, as distinguished from the sentence, is more humane than logical, and seems to have been at first admitted in capital cases only. The exception in rape cases does not allow evidence to be given of specific acts of immorality with persons other than the prisoner, doubtless on the ground that such evidence would affect the reputations of third parties. Where the character of a person is expressly in issue, as in actions of libel and slander, the rule of exclusion, as stated above, does not apply. Nor does it prevent evidence of bad character from being given in mitigation of damages, where the amount of damages virtually depends on character, as in cases of defamation and seduction. As to conviction there is a similar general rule, that evidence of the conduct of a prisoner on other occasions is not to be used merely for the purpose of showing the likelihood of his having acted in a similar way on a particular occasion. Thus, on a charge of murder, the prosecutor cannot give evidence of the prisoner’s conduct to other persons for the purpose of proving a bloodthirsty and murderous disposition. And in a civil case a defendant was not allowed to show that the plaintiff had sold goods on particular terms to other persons for the purpose of proving that he had sold similar goods on the same terms to the defendant. But this general rule must be considered. Where several offences are so connected with each other as to form parts of an entire transaction, evidence of one is admissible as proof of another. Thus, where a prisoner is charged with stealing particular goods from a particular place, evidence may be given that other goods, taken from the same place at the same time, were found in his possession. And where it is proved or admitted that a person did a particular act, and the question is as to his state of mind, that is to say, whether he did the act knowingly, intentionally, fraudulently, or the like, evidence may be given of the commission by him of similar acts on other occasions for the purpose of proving his state of mind on the occasion. This principle is most commonly applied in charges for uttering false documents or base coin, and not uncommonly in charges for false pretences, embezzlement or murder. In proceedings for the receipt or possession of stolen property, the legislature has expressly authorized evidence to be given of the possession by the prisoner of other stolen property, or of his previous conviction of an offence involving fraud or dishonesty.
EVIDENCE

(Prevention of Crimes Act 1871). Again, where there is a question whether a person committed an offence, evidence may be given of any fact supplying a motive or constituting prepara-
tion for the offence, of any subsequent conduct of the person accused, which is apparently influenced by the commission of the offence, and of any act done by him, or by his authority, in consequence of the offence. Thus, evidence may be given that, although the accused person was not in the place of the crime, he was, on a later occasion, present at the scene, or in the house, or in possession of the property, or the proceeds of the property, acquired by the offence, or that he attempted to conceal things which were or might have been used in com-
mittting the offence, or as to the manner in which he conducted himself when statements were made in his presence and hearing.

Statements made to or in the presence of a person charged with an offence are admitted as evidence, not of the facts stated, but of the conduct or demeanour of the person to whom or in whose presence they are made, or of the general character of the trans-
action of which they form part (under the res gestae rule men-
tioned below).

2. Best Evidence Rule.—Statements to the effect of the best evidence rule were often made by Chief Justice Holt about the beginning of the 18th century, and became familiar in the courts. Chief Baron Gilbert, in his book on evidence, which must have been written before 1726, says that “the first and most signa-
tural rule in relation to evidence is this, that a man must have the ustest evidence the nature of the fact is capable of.” And in the great case of Omichand v. Barker (1744), Lord Hardwicke went so far as to say, “The judges and sages of the law have laid down that there is but one general principle, more than all others, the best that the nature of the case will admit” (1 Atkyns 49). It is no wonder that a rule thus solemnly stated should have found a prominent place in text-books on the law of evidence. But, apart from its application to documentary evidence, it does not seem to be more than a useful guiding principle which underlies, or may be used in support of, several rules.

It is to documentary evidence that the principle is usually applied, in the form of the narrower rule excluding, subject to exceptions, secondary evidence of the contents of a document where primary evidence is obtainable. In this form the rule is a rule of exclusion, but may be most conveniently dealt with in connexion with the special subject of documentary evidence. As noticed above, general rules do not apply to the differ-
ence between direct and indirect evidence. And, doubtless on account of its vague character, it finds no place in Stephen's Digest.

3. Hearsay.—The term “hearsay” primarily applies to what a witness has heard another person say in respect to a fact in dispute. But it is extended to any statement, whether reduced to writing or not, which is brought before the court, not by the author of the statement, but by a person to whose knowledge the statement has been brought. Thus the hearsay rule excludes statements, oral or written, made in the first instance by a person who is not called as a witness in the case. Historically this rule may be traced to the time when the functions of the witnesses were first distinguished from the functions of the jury, and when the witnesses were required by their formula to testify de visu suo et auditu, to state what they knew about facts from the direct evidence of their senses, not from the information of others.

The rule excludes statements the effect of which is liable to be altered by the narrator, and which purport to have been made by persons who did not necessarily speak under the sanction of an oath, and whose accuracy or veracity is not tested by cross-
examination. It is therefore of practical utility in shutting out many of those statements and much irresponsible gossip. On the other hand, it excludes statements which are of some value as evidence, and may indeed be the only available evidence. Thus, a statement has been excluded as hearsay, even though it can be proved that the author of the statement made it on oath, or that it was against his interest when he made it, or that he is prevented by insanity or other illness from giving evidence him-
self, or that he has left the country and disappeared, or that he is dead.

Owing to the inconveniences which would be caused by a strict application of the rule, it has been so much eaten into by exceptions that persons dealing with evidence must always be on their guard not to change places. Among the exceptions the following may be noticed: (a) Certain sworn statements.—In many cases statements made by a person whose evidence is material, but who cannot come to court, to give evidence, before a coroner, by reason of illness, delay or expense, may be admitted as evidence under proper safeguards. Under the Indictable Offences Act 1848, where a person has made a deposition before a justice at a preliminary inquiry into an offence, his deposition may be read in evidence, if the depos-
tenant is dead, or too ill to travel, that the deposition was taken in the presence of the accused person, and that the accused had been given an opportunity of cross-examining the deponent. The deposition must appear to be signed by the justice before whom it purports to have been taken. Depositions taken before a coroner are admissible under the same principle. And the principle probably extends to those deposited, or who have made statements before a coroner. There are other statutory provisions for the admission of depositions, as in the Criminal Law Amendment Act 1867; the Foreign Jurisdiction Act 1890; and the Children Act 1908, incor-
porating that of 1870.

In civil cases the rule excluding statements not made in court at the trial is much less strictly applied. Frequent use is made of evidence taken before an examiner, or under a com-
mission, affidavits are freely used for subordinate issues or under an arrangement between the parties, and leave may be given to use evidence taken in other proceedings. The old chancery practice, under which evidence, both at the trial and at other stages of a preliminary examination, was normally not used in determining the law or fact, was altered by the Judicature Acts. Under the existing rules of the supreme court evidence may be given by affidavit upon any motion, petition or summons, but the court of a judge may, on the application of either of the parties, and with the consent of the person making the affidavit, (b) Dying declarations.—In a trial for murder or manslaughter a declaration by the person accused, whether made before or after the commission of the offence, or to a person having the power to give, or in the case of the circumstances of the transaction which result in the death of another, evidence. But this exception is very strictly construed. It must be proved that the declarant, at the time of making the declaration, entertained a reasonable fear of death and mental suffering, and that he had given the statement to a person having the power to give it to the proper authority.

(c) Statements in pedigree cases.—On a question of pedigree the statement of a deceased person, whether based on his own personal knowledge or on family tradition, is admissible as evidence, if it is proved by the party making the statement that the person about whose family relations the statement was made, and that the statement was made before the question with respect to which the evidence is required had arisen. (d) Statements as to matters of public or general interest.—Statements by deceased per-
sons are admissible as evidence of reputation or general belief in questions relating to the existence of any public or general right or custom, or matter of public and general interest. Statements of this kind are constantly admitted in questions relating to right of way, or rights of common, or manorial or other local customs. Maps, copies of court rolls, leases and other deeds, and verdicts, judgments, and orders in cases that fall within such matters, are admissible for this kind.

(e) Statements in course of duty or business.—A statement with respect to a particular fact made by a deceased person in pursuance of his duty in connexion with any office, employment or business, whether public or private, is admissible as evidence of fact, if the statement appears to have been made from personal knowledge, and at or about the time when the fact occurred. This kind includes matters connected with the business of insurance companies, and statements against interest.—A statement made by a deceased person against his pecuniary or proprietary interest is admissible as evidence, without reference to the time at which it was made. Where such a statement is admissible the whole of it becomes admissible, though it may contain matters not against the interest of the person who made it, and though the total effect may be in his favour. Thus, whether the question was whether a particular sum was a gift or a loan, entries in an acreage book of revenue, which were never checked, were admitted, and a statement in the book that the alleged debtor had on a particular date acknowledged the loan was also admitted.

(a) Statements in documents.—Statements have been held to be admissible as evidence, if the documents are public or parliamentary notices, notices in the London, Edinburgh, or Dublin Gazette (which are made evidence by statute in a large number of cases), and entries made in the performance of duty in official registers, records, ledgers, and other books of public offices, registers of companies, records in judicial proceedings, and the like. An entry in a public document may be treated as a statement made in the course of duty, but it is admissible whether the person who made the statement is alive or not, and is admissible only as to personal knowledge, or the time at which the statement is made.

(b) Admissions.—By the term "admission," as here used, is meant a statement made out of court or ex tempore, and is opposed to whether civil or criminal, or by some person whose statements are binding on that party, against the interest of that party. The term includes admissions made in answer to interrogatories, or to a notice to admit facts, but not admissions made on the pleadings. Admis-
sions, in this sense of the term, are admissible as evidence against the person by whom they are made, or on whom they are binding,
without reference to the life or death of the person who made them. A general admission of facts is not evidence of the act, except under the scope of his authority, and barristers and solicitors are agents for their clients in the conduct of legal proceedings. Conversely, a person suing or defending on behalf of another, e.g. as agent or trustee, by admission or statement in court proves, and is evidence of, the facts of which he is informed. Statements respecting property made by a predecessor in title bind the successor. Where a statement is put in evidence as an admission by, or for the benefit of, any person that he is bound to make, it has not been admitted as evidence. The principle of this rule is obviously sound, because it would be unfair to pick out from a man's statement what tells against him, and to suppress what is in his favour. The implication is that there is something embarrassing with difficulty. An admission will not be allowed to be used as evidence if it was made under a stipulation, express or implied, that it should not be so used. Such admissions are said to be made "in forma pauperis." The statement made by the prisoner. If the prisoner is made to confess his guilt, either by a person accused of an offence that he has committed, or by his accomplice, it is sometimes difficult to distinguish between the two. As a rule, the prisoner will be relieved if he can show that he was made to confess by the means of which his guilt was actually discovered by the police. He must show that he was not aware of the connexion with the crime, or that he did not know that his guilt had been discovered. It is, however, plain that a confession cannot be admitted as evidence unless proved to be voluntary. A confession is not treated as being voluntary if it appears to the court to have been made under any form of compunction or influence. The voluntariness of the confession must be proved. But a confession is not involuntary merely because it appears to have been caused by the exhortations of a person in authority to make it as a matter of religious duty, or by an inducement collateral to the charge. With respect to an inducement connected with the making of the confession, the court may consider, if it thinks fit, whether, in the circumstances of the case, the prisoner was induced to make his confession by anything more than something in the nature of the ordinary connexion between the accused person and the court. Thus, a confession made to a gaol chaplain in consequence of religious exhortation has been admitted as evidence. But, say, for instance, the prisoner has been induced to make his confession by a promise of preferment in the service of the Empire. Such a promise is not considered to be a connexion with the crime, and the confession may be admitted. A person who has been induced, say, by a promise of preferment in the service of the Empire, to make a confession of guilt is not considered to be a connexion with the crime, and the confession may be admitted. A person who has been induced, say, by a promise of preferment in the service of the Empire, to make a confession of guilt is not considered to be a connexion with the course of procedure. The evidence of such a confession is not admissible against the accused person unless it is proved that he was aware of the connexion with the crime, or that he knew that his guilt had been discovered by the police. 

There is no difficulty in understanding the principle on which this exception is based. It is derived from the principle of the "transaction," and it is applicable to other cases of what is known as the "transaction." The rule is that primary evidence must be given except in the case of the secondary evidence. By primary evidence, it is meant the document itself produced for inspection. By secondary
evidence is meant a copy of the document, or verbal accounts of its contents.

The rule as to the inadmissibility of a copy of a document is applied much more strictly to private than to public or official documents. Evidence may be given of the contents of a private document in the following cases:

(a) Where the original is shown or appears to be in the possession of some other party, and it has been having been reunited with reasonable diligence to produce it, does not defeat it;

(b) Where the original is shown or appears to be in the possession or power of a stranger not legally bound to produce it, and he cannot have been served with a writ of subpoena tecum, or after having been sworn as a witness and asked for the document, and having admitted that it is in court, refuses to produce it;

(c) Where it is shown that proper search has been made for the original, and there is reason for believing that it is destroyed or lost;

(d) Where the original is of such a nature as not to be easily removable, as in the case of a placard posted on a wall, or of a tombstone, or is in a country from which it is not permitted to be removed;

(e) Where the original is a document for the proof of which special provision is made by any act of parliament, or any law in force for the time being. Documents of that kind are practically treated on the same footing as private documents;

(f) Where the document is an entry in a banker's book, provable according to the special provisions of the Bankers' Books Evidence Act 1879.

Secondary evidence of a private document is usually given either by producing a copy and calling a witness who can prove the copy to be correct, or, when there is no copy obtainable, by calling a witness who has seen the document, and can give an account of its contents. Secondary evidence may be given by a witness, but the rules of evidence applicable to public documents are expressly applied by statute to many classes of documents. Primary evidence of any public document may be given by producing the document from public records. If a copy of the document is in such public custody as to be admissible in evidence for the purposes of production from the public custody, and no statute exists which renders its contents provable by means of a copy, any copy thereof or extract therefrom is admissible as proof of its contents, if it is proved to be an examined copy or extract; or purports to be signed or certified as a true copy or extract by the officer to whose custody the original is entrusted. Many statutes provide that various certificates, official and public documents, documents and proceedings of corporations; and of joint stock and other companies, and certified copies of documents, by-laws, entries in registers and other books, shall be receivable as evidence of certain particulars in cases of justice, if they are authenticated in the manner prescribed by the statutes. Whenever, by virtue of any such provision, any such certificate or certified copy is receivable as proof of any particular fact, the court of justice, as evidence, if it purports to be authenticated in the manner prescribed by law, without calling any witness to prove any stamp, seal, or signature required for its authentication, or the official character of the person who appears to have signed it. The Documentary Evidence Acts 1868, 1882 and 1895, provide modes of proving the contents of several classes of proclamations, orders and regulations.

If a document is of a kind which is required by law to be attested, but not otherwise, an attesting witness must be called to prove its due execution. But this rule is subject to the following exceptions:

(a) If it is proved that there is no attesting witness alive, and capable of giving evidence, then it is sufficient to prove that the attestation of at least one attesting witness is in his handwriting, and that the signature of the person executing the document is in the handwriting of that person.

(b) If the document is proved, or purports to be, more than thirty years old, and is produced from what the court considers proper custody, an attesting witness need not be called, and it will be sufficient without evidence that the instrument was duly executed and attested.

Where a document embodies a judgment, a contract, a grant, or disposition of property, or any other legal transaction or "act in the law," on which rights depend, the validity of the transaction may be impugned on the ground of fraud, incapacity, want of consideration, or other legal ground. But this seems outside the law of evidence. In this class of cases a question often arises of whether one part of the transaction is conclusive as to the nature of the transaction embodied in the document. The answer to this question seems to depend on whether the docu-

ment was or was not intended to be a complete and final statement of the transaction which it embodies. If it was, you cannot go outside the document for the purpose of ascertaining the nature of the transaction. If it was not, you may. But the mere statement of this test shows the difficulty of formulating precise rules, and of applying them when formulated. Fitz-James Stephen mentions, among the facts which may be proved in these cases, the existence of separate and consistent oral agreements as to matters on which the document is silent, if there is reason to believe that the document is not a complete and final statement of the transaction, and the existence of any usage or custom with reference to which a contract may be presumed to have been made. But he admits that the rules on the subject are "by no means easy to apply, inasmuch as from the nature of the case an enormous number of transactions fall close on one side or the other of most of them." The underlying principle appears to be a rule of substantive law rather than of evidence. When parties to an arrangement have reduced the terms of the arrangement to a definite, complete, and final written form, they should be bound exclusively by the terms embodied in that form. The question in each case is under what circumstances they ought to be treated as having done so.

The expression "parol evidence," which includes written as well as verbal evidence, has often been applied to the extrinsic evidence produced for the purpose of varying the nature of the transaction embodied in a document. It is also applied to extrinsic evidence used for another purpose, namely, that of explaining the meaning of the terms used in a document. The two situations, What is the real nature of the transaction referred to in a document? and, What is the meaning of a document? are often confused, but are really distinct from each other. The rules bearing on the latter question are rules of construction or interpretation rather than of evidence, but are ordinarily treated as part of the law of evidence, and are for that reason included by Fitz-James Stephen in his Digest. In stating these rules he adopts, with verbal modifications, the six propositions laid down by Vice-Chancellor Wigram in his Examinations of the Rules of Law respecting the admission of Extrinsic Evidence in Aid of the Interpretation of Wills. The substance of these propositions appears to be this, that wherever the meaning of a document cannot be satisfactorily ascertained from the document itself, use may be made of any other evidence for the purpose of elucidating the meaning, subject to one restriction, that, except in cases of equivocation, i.e. where a person or thing is described in terms applicable equally to more than one, resort cannot be had to extrinsic expressions of the author's intention.

V. WITNESSES

1. Attendance.—If a witness does not attend voluntarily he can be required to attend by a writ of subpoena.

2. Competency.—As a general rule every person is a competent witness. Formerly persons were disqualified by crime or interest, or by being parties to the proceedings, but these disqualifications have now been removed by statute, and the circumstances which formerly created them do not affect the competency, though they may often affect the credibility, of a witness. Under the general law as it stood before the Criminal Evidence Act 1898 came into force, a person charged with an offence was not competent to give evidence on his own behalf. But many exceptions had been made to this rule by legislation, and the rule itself was finally abolished by the act of 1898. Under that law a person charged is a competent witness, but he can only give evidence for the defence, and can only give evidence if he himself applies to do so. Under the law as it stood before 1898, persons jointly charged and being tried together were not competent to give evidence either for or against each other. But the act of 1898 a person charged jointly with another is a competent witness, but only for the defence, and only if the person charged applies to give evidence. His cross-examination must not be conducted with a view to establish the guilt of the other. Consequently, if it is thought
desirable to use against one prisoner the evidence of another who is being tried with him, the latter should be released, or a separate verdict of not guilty taken against him. A prisoner so giving evidence is popularly said to turn king's evidence. It follows that, subject to what has been said above as to persons tried together, the evidence of an accomplice is admissible against his principal, and vice versa. The evidence of an accomplice is, however, always received with great jealousy and caution. A conviction on the unsupported testimony of an accomplice may, in some cases, be strictly legal, but the practice is to require it to be confirmed by unimpeachable testimony in some material part, and more especially as to his identification of the person or persons against whom his evidence may be received. The evidence of a person charged is now a competent witness, but, except in certain special cases, she can only give evidence for the defence, and can only give evidence if her husband applies that she should do so. The special cases in which a wife can be called as a witness either for the prosecution or for the defence, and without the consent of the person charged, are cases arising under particular enactments scheduled to the act of 1898, and relating mainly to offences against wives and children, and cases in which the wife is by common law a competent witness against her husband, i.e. where the proceeding is against the husband for bodily injury or violence inflicted on his wife. The rule of exclusion extends only to a lawful wife. There is no ground for supposing that the wife of a prosecutor is an incompetent witness. A witness is incompetent if, in the opinion of the court, he is prevented by extreme youth, disease affecting his mind, or any other cause of the same kind, from recollecting the matter on which he is to testify, from understanding the questions put to him, from giving rational answers to those questions, or from knowing that he ought to speak the truth. A witness unable to speak or hear is not incompetent, but may give his evidence by writing or by signs, or by any other manner in which he can make it intelligible. The particular form of the religious belief of a witness, or his want of religious belief, does not affect his competency. This ground of incompetency has now been finally removed by the Oaths Act 1888. It will be seen that the effect of the successive enactments which have gradually removed the disqualifications attaching to various classes of witnesses has been to draw a distinction between the competency of a witness and his credibility. No person is disqualified on moral or religious grounds, but his character may be such as to throw grave doubts on the value of his evidence. No relationship, except to a limited extent that of husband and wife, excludes from giving evidence. The parent may be examined on the trial of the child, the child on that of the parent, master for or against servant, and servant for or against master. The relationship of the witness to the prosecutor or the prisoner in such cases may affect the credibility of the witness, but does not exclude his evidence.

3. Privilege.—It does not follow that, because a person is competent to give evidence, he can therefore be compelled to do so.

No one, except a person charged with an offence when giving evidence on his own application, and as to the offence whereby he is charged, is bound to answer a question if the witness would, in the opinion of the court, have a tendency to expose the witness, or the wife or husband of the witness, to any criminal charge, penalty, or forfeiture, which the court regards as reasonably likely to be preferred or sued for. Accordingly, an accomplice cannot be examined without his consent, but if an accomplice who has come forward to give evidence on a promise of pardon, or favourable consideration, refuses to give full and fair information, he renders himself liable to be convicted on his own confession. However, even accomplices in such circumstances are not required to answer on their cross-examination as to other offences. Where, under the new law, a person charged with an offence offers himself as a witness, he may be asked any question in cross-examination, notwithstanding that it would tend to criminate him as to the offence charged. But he may not be asked, and if he is asked must not be required to answer, any question tending to show that he has committed, or been convicted of, or been charged with, any other offence, or is of bad character, unless—

(i.) The proof that he has committed, or been convicted of, the other offence is admissible evidence to show that he is guilty of the offence with which he is then charged; or

(ii.) He has personally, or by his advocate, asked questions of the witnesses for the prosecution with a view to establish his own good character, or has given evidence of his good character, or the nature or conduct of the defence is such as to involve imputations on the character of the prosecutor or the witnesses for the prosecution; or

(iii.) He has given evidence against any other person charged with the same offence.

He may not be asked questions tending to criminate his wife.

The privilege as to criminating answers does not cover answers merely tending to establish a civil liability. No one is excused from answering a question or producing a document only because the answer or document may establish or tend to establish that he owes a debt, or is otherwise liable to any civil proceeding. It is a privilege for the protection of the witness, and therefore may be waived by him. But there are other privileges which cannot be so waived. Thus, on grounds of public policy, no one can be compelled, or is allowed, to give evidence relating to any affairs of state, or as to official communications between public officers upon public affairs, except with the consent of the head of the department concerned, and this consent is refused if the production of the information asked for is considered detrimental to the public service.

Again, in cases in which the government is immediately concerned, no witness can be compelled to answer any question the answer to which would tend to discover the names of persons by or to whom information was given as to the commission of offences. It is, as a rule, for the court to decide whether the permission of any such question would or would not, under the circumstances of the particular case, be injurious to the administration of justice.

A husband is not compellable to disclose any communication made to him by his wife during the marriage; and a wife is not compellable to disclose any communication made to her by her husband during the marriage.

A legal adviser is not permitted, whether during or after the termination of his employment as such, unless with his client's express consent, to disclose any communication, oral or documentary, made to him as such legal adviser, by or on behalf of his client, during, in the course of, and for the purpose of his employment, or to disclose any advice given by him to his client during, in the course of, and for the purpose of such employment.

But this claim extends not to—

(a) Any such communication if made in furtherance of any criminal purpose; nor

(b) Any fact observed by a legal adviser in the course of his employment as such, showing that any crime or fraud has been committed since the commencement of his employment, whether his attention was directed to such fact by or on behalf of his client or not; nor

(c) Any fact with which the legal adviser became acquainted otherwise than in his character as such.

Medical men and clergymen are not privileged from the disclosure of communications made to them in professional confidence, but it is not usual to press for the disclosures of communications made to clergymen.

4. Oaths.—A witness must give his evidence under the sanction of an oath, or of what is equivalent to an oath, that is to say, of a solemn promise to speak the truth. The ordinary form of oath is adapted to Christians, but a person belonging to a non-Christian religion may be sworn in any form prescribed or recognized by the custom of his religion. (See the article Oath.)

5. Publicity.—The evidence of a witness at a trial must, as a general rule, be given in open court in the course of the trial. The secrecy which was such a characteristic feature of the "inquisition" procedure is abhorrent to English law, and, even where publicity conflicts with decency, English courts are very reluctant to dispense with or relax the safeguards for justice which publicity involves.
6. Examination.—The normal course of procedure is this. The party who begins, i.e. ordinarily the plaintiff or prosecutor, calls his witnesses in order. Each witness is first examined on behalf of the party for whom he is called. This is called the examination in chief. Then he is liable to be cross-examined on behalf of the other side. And, finally, he may be re-examined on behalf of his own side. After the case for the other side has been opened, the same procedure is adopted with the witnesses for that side. In some cases the party who began is allowed to adduce further evidence in reply to his opponent's evidence. The examination is conducted, not by the court, but by or on behalf of the contending parties. It will be seen that the principle underlying this procedure is that of the duel, or conflict between two contending parties, each relying on and using his own evidence, and trying to break down the evidence of his opponent. It differs from the principle of the "inquisition" procedure, in which the court takes a more active part, and in which the cases for the two sides are not so sharply distinguished. In a continental trial it is often difficult to determine whether the case for the prosecution or the case for the defence is proceeding. Conflicting witnesses stand up together and are "confronted" with each other. In the examination in chief questions must be confined to matters bearing on the main question at issue, and a witness must not be asked leading questions, i.e. questions suggesting the answer which the person putting the question wishes or expects to receive, or suggesting disputed facts about which the witness is to testify. But the rule about leading questions is not applied where the questions asked are sufficiently open to elicit, if the witness knows, the real state of the facts, or the inquiry, or where they relate to matters which, though material, are not disputed. And if the witness called by a person appears to be directly hostile to him, or interested on the other side, or unwilling to reply, the reason for the rules applying to examination in chief breaks down, and the witness may be asked leading questions and cross-examined, and treated in every respect as though he was a witness called on the other side, except that a party producing a witness must not impeach his credit by general evidence of bad character (Evidence and Practice on Criminal Trials in England; Stephen [Sir J. F.], History of the Criminal Law of England; Pollock and Maitland, History of English Law, bk. ii. ch. ix.; Thayer: Preliminary Treatise on Evidence at the Common Law). The two most important books on the subject are: The Law of Evidence on the Trial of Actions at nisi prius (18th ed., 1907); Roscoe, Digest of the Law of Evidence in Criminal Cases (13th ed., 1908); Taylor, Treatise on the Practice of Evidence (10th ed., 1906). Best, Principles of the Law of Evidence (10th ed., 1906); Powell, Principles and Practice of the Law of Evidence (8th ed., 1904); Stephen, Digest of the Law of Evidence (8th ed., 1907); Wills, Theory and Practice of the Law of Evidence (2nd ed., 1907).

The question of the admissibility of various kinds of evidence is considered elsewhere (see Evidences). It may be added that there are a number of persons whose evidence is considered to be "exclusively for the courts," i.e. not to be given in evidence against any one. These are the masons, bricklayers, and other workmen employed on various public buildings. The evidence of these men is in the nature of public records, and is of great importance, but it is not admissible in evidence against any one. The same is true of the evidence of the "sacred" or "court" witnesses, i.e. those who are sworn to give evidence in the case. The evidence of these witnesses is considered to be evidence of a character similar to that of the public records, and is not admissible in evidence against any one.

On the other hand, the evidence of the "unofficial" witnesses is admissible in evidence against any one. The evidence of these witnesses is considered to be evidence of a character similar to that of the public records, and is not admissible in evidence against any one.

Statement, sufficient to designate the particular occasion, must be mentioned to the witness, and he must be asked whether he did or did not make the statement. And if the statement was made, or has been reduced to, writing, the attention of the witness must, before the writing is used against him, be called to those parts of the writing which are to be used for the purpose of contradicting him (see Evidence and Practice on Criminal Trials in England; Stephen [Sir J. F.], History of the Criminal Law of England; Pollock and Maitland, History of English Law, bk. ii. ch. ix.; Thayer: Preliminary Treatise on Evidence at the Common Law). The two most important books on the subject are: The Law of Evidence on the Trial of Actions at nisi prius (18th ed., 1907); Roscoe, Digest of the Law of Evidence in Criminal Cases (13th ed., 1908); Taylor, Treatise on the Practice of Evidence (10th ed., 1906). Best, Principles of the Law of Evidence (10th ed., 1906); Powell, Principles and Practice of the Law of Evidence (8th ed., 1904); Stephen, Digest of the Law of Evidence (8th ed., 1907); Wills, Theory and Practice of the Law of Evidence (2nd ed., 1907).

EVIL EYE. The terror of the arts of "fascination," i.e. that certain persons can bewitch, injure and even kill with a glance, has been and is still very widely spread. The power was not thought to be always maliciously cultivated. It was as often supposed to be involuntary (cf. Deuteronomy xxviii. 54); and a story is told of a Slav who, afflicted with the evil eye, at last blinded himself in order that he might not be the means of injuring his children (Woycikl, Polish Folklore, trans. by Lewenstein, p. 23). Few of the old classic writers fail to refer to the dread power. In Rome the "evil eye" was so well recognized that Pliny states that special laws were enacted against injury to crops by incantation, execution or fascination. The power was styled йаnασвия by the Greeks and fасinаtо by the Latins. Children and young animals of all kinds were thought to be specially susceptible. Charms were worn against the evil eye both by man and beast, and in Judges viii. 21 it is thought there is a reference to this custom in the allusion to the "ornaments on the necks of camels. In classic times the wearing of amulets was universal. They were of three classes: (1) those the intention of which was to attract on to themselves, as the lightning, the misfortune of the person; (2) charms hidden in the bosom of the dress; (3) written words from sacred writings. Of these three types the first was most numerous. They were oftenest of a grotesque and generally grossly obscene nature. They were also made in the form of frogs, beetles and so on. But the ancients did not wholly rely on amulets. Splitting was among the Greeks and Romans a most common antidote to the poison of the evil eye. According to Theocritus it is necessary to spit three times into the breast of the person who fears fascination. Gestures, too, often intentionally obscene, were regarded as prophylactics on meeting the dreaded individual. The evil eye was believed to have its impulse in envy, and thus it came
EVOLUTION

Among the Romans, therefore, it was customary when praising anything to add *Praefastics dixerim* (Pain Evil! I should say). This custom survives in modern Italy, where in like circumstances is said *Si mal occhio non ci fosse* (May the evil eye not strike it). The object of these conventional phrases was to prove that the speaker was sincere and had no evil designs in his praise. Though there is no set formula, traces of the custom are found in English rural sayings, e.g. the Somersetshire "I don't wish ee no harm, so I on't say no more." This is what the Scots call "fore-speaking," when praise beyond measure is likely to be followed by disease or accident. A Manxman will never say he is very well; he usually admits that he is "midding," or qualifies his admission by adding something like "*mal este,"* which is interpreted as meaning both that the belief led in many countries to the saying, when one heard anybody or anything praised superabundantly, "God preserve him or it." So in Ireland, to avoid being suspected of having the evil eye, it is advisable when looking at a child to say "God bless it!"; and when passing a farm-yard where cows are collected at milking time it is usual for the peasant to say, "The blessing of God be on you and all your labour." Bacon writes: "It seems some have been so curious as to note the times when the stroke ... of an envious eye does most hurt particularly when the party envied is held in glory and triumph." The powers of the evil eye are capable of being most feared by the prosperous. Its powers are often quoted as almost limitless. Thus one record solemnly declares that in a town of Africa a fanatic called Elzanar killed by his evil art no less than 80 people in two years (W. W. Story, *Castle St Angelo,* 1877, p. 140). The belief as affecting cattle was universal in the Scottish Highlands as late as the 18th century and still lingers. Thus if a stranger looks admiringly on a cow the peasants still think she will waste away, and they offer the visitor some of her milk to drink in the belief that in this manner the spell is broken. Thopek. The superstition is universal among savage races and camels are subject to the evil eye. But the people of Italy, especially the Neapolitans, are the best modern instances of implicit believers. The *jettatore,* as the owner of the evil eye is called, is so feared that at his approach it is scarcely an exaggregation to say that a street will clear: everybody will rush into doorways or up alleys to avoid the dreaded glance. The *jettatore di bambini* (lascinator of children) is the most dreaded of all. The evil eye is still much feared for horses in India, China, Turkey, Greece and almost everywhere where horses are found. In rural England the pig is of all animals oftener "overlooked." While the Italians are perhaps the greatest believers in the evil eye as affecting persons, the superstition is rife in the East. In India the belief is universal. In Bombay the blast of the evil eye is supposed to be a form of spirit-possession. In western India all witches and wizards are said to be evil-eyed. Modern Egyptian mothers thus account for the sickly appearance of their babies. In Turkey passages from the Koran are painted on the outside of houses to save the inmates, and texts and amulets are worn upon the person, or hung upon camels and horses by Arabs, Abyshniacs and other peoples. The superstition is universal among savage races and children.

For a full discussion see *Evil Eye* by F. T. Elworthy (London, 1865); also W. W. Story, *Castle St Angelo and the Evil Eye* (1877); E. N. Rolfe and H. Ingleby, *Naples in 1888* (1888); Johannes Christian Frommann, *Traiteaux de fascination noues et singuliers,* &c, &c. (Nuremberg, 1865); R. C. Macalcan, *Evil Eye in the Western Highlands* (1902).

**EVOLUTION.** The modern doctrine of evolution or "evolving," as opposed to that of simple creation, has been defined by Prof. James Sully in the 9th edition of this *encyclopaedia* as a "natural history of the cosmos including organic beings, expressed in physical terms as a mechanical process." The following exposition of the historical development of the doctrine is taken from Sully's article, and for the most part is in his own words.

In the modern doctrine of evolution the cosmic system appears as a natural product of elementary matter and its laws. The various grades of life on our planet are the natural consequences of certain physical processes involved in the gradual transformations of the earth. Conscious life is viewed as conditioned by physical (organic and more especially nervous) processes, and as evolving itself in close correlation with organic evolution.

Finally, human development, as exhibited in historical and pre-historical records, is regarded as the highest and most complex result of organic and physical evolution. This modern doctrine of evolution is but an expansion and completion of those physical theories (see below) which opened the history of speculation.

It differs from them in being grounded on exact and verified research. As such, moreover, it is a much more limited theory of evolution than the ancient. It does not necessarily concern itself about the question of the infinitude of worlds in space and time. It has not yet considered the intelligent development of the world, the solar or, at most, the sidereal system which falls under our own observation. It would be difficult to say what branches of science had done most towards the establishment of this doctrine. We must content ourselves by referring to the progress of physical (including chemical) theory, which has led to the great generalization of the conservation of energy; to the discovery of the fundamental chemical identity of the matter of our planet: and of other celestial bodies, and of the chemical relations of organic and inorganic bodies; to the advances of historical speculation respecting the origin of the solar system, &c.; to the growth of the biological sciences which has made us familiar with the simplest types and elements of organism; finally, to the development of the science of anthropology (including comparative psychology, philology, &c.), and to the vast extension and improvement of all branches of historical study.

**History of the Idea of Evolution.**—The doctrine of evolution in its finished and definite form is a modern product. It required for its formation an amount of knowledge which could only be very gradually acquired. It is very, therefore, to look for clearly defined and systematic presentations of the idea among ancient writers. On the other hand, nearly all systems of philosophy have discussed the underlying problems. Such questions as the origin of the cosmos as a whole, the production of organic beings and of conscious minds, and the meaning of the observable grades of creation, have from the dawn of speculation occupied men's minds; and the answers to these questions often imply a vague recognition of the idea of a gradual evolution of things. Accordingly, in tracing the antecedents of the modern philosophic doctrine we shall have to glance at most of the principal systems of cosmology, ancient and modern. Yet since in these systems inquiries into the *esse* and *fieri* of the world are rarely distinguished with any precision, it will be necessary to indicate very briefly the general outlines of the system so far as they are necessary for understanding their bearing on the problems of evolution.

**Mythological Interpretation.**—The problem of the origin of the world was the first to engage man's speculative activity. Nor was this line of inquiry pursued simply as a step in the more practical problem of man's final destiny. The order of ideas observable in children suggests the reflection that man began to discuss the "whence" of existence before the "whither." At first, as in the case of the child, the problem of the genesis of things was conceived anthropomorphically: the question "How did the world arise?" first shaped itself to the human mind under the form "Who made the world?" As long as the problem was conceived in this simple manner there was, of course, no room for the idea of a necessary self-conditioned evolution. Yet the first indissoluble germ of such an idea appears to emerge in combination with that of creation in some of the ancient systems of theogony. Thus, for example, in the myth of the ancient Parsees, the gods Ormuzd and Abriman are said to evolve themselves out of a primordial matter. It may be supposed that these crude fancies embody a dim recognition of the physical forces and objects personified under the forms of deities, and a rude attempt to account for their genesis as a natural
process. These first unscientific ideas of a genesis of the perennial objects of nature took as their pattern the process of organic reproduction and development, and this, not only because these objects were regarded as personalities, but also because this particular mode of becoming would most impress these early observers. This same way of looking at the origin of the material world is illustrated in the Egyptian notion of a cosmic egg out of which issues the god (Ptah) who creates the world.

**Indian Philosophy.**—Passing from mythology speculation properly so called, one finds in the early systems of philosophy in India the notion of emanation which approaches in some respects the idea of evolution. Brahama is conceived as the eternal self-existing being, which on its material side unfolds itself to the world by gradually condensing itself to material objects through the gradations of ether, fire, water, earth and the elements. At the same time this eternal being is conceived as the all-embracing world-soul from which emanates the hierarchy of individual souls. In the later system of emanation of Sankhya there is a more marked approach to a materialistic doctrine of evolution. If, we are told, we follow the chain of causes far enough back we reach unlimited eternal creative nature or matter. Out of this "principal thing" or "original nature" all material and spiritual existence issues, and into it will return. Yet this primordial creative nature is endowed with volition with regard to its own development. Its first emanation as plastic nature contains the original soul or deity out of which all individual souls issue.

**Early Greek Physicists.**—Passing by Buddhism, which, though teaching the periodic destruction of our world by fire, &c., does not seek to determine the ultimate origin of the cosmos, we come to those early Greek physical philosophers who distinctly set themselves to eliminate the idea of divine interference with the world by representing its origin and changes as a natural process. The early Ionian physicists, including Thales, Anaximander and Anaximenes, seek to explain the world as generated out of a primordial matter (Gr. ἐνίοτε; hence the name "Hylozoists"), which is at the same time the universal support of things. This substance is endowed with a generative or transmutative force by virtue of which it passes into a succession of forms. They thus resemble modern evolutionaryists, since they regard the world with its infinite variety of forms as issuing from a simple mode of matter. More especially the cosmology of Anaximander resembles that modern doctrine of evolution in the conception of the indeterminate (τὸ ἀνεξορίου) out of which the particular forms of the cosmos are differentiated. Again, Anaximander may be said to prepare the way for more modern conceptions of material evolution by regarding his primordial substance as eternal, and by looking on all generation as alternating with destruction, each step of the process being of course simply a transformation of the indestructible substance. Once more, the notion that this indeterminate body contains potentially in itself the fundamental contraries—hot, cold, &c.—by the excretion or evolution of which definite substances were generated, is clearly a forecast of that antithetical view of duality and activity which from Aristotle downwards has been the basis of so many theories of development. In conclusion, it is noteworthy that though resorting to utterly fanciful hypotheses respecting the order of the development of the world, Anaximander agrees with modern evolutionaryists in conceiving the heavenly bodies as arising out of an aggregation of diffused matter, and in assigning to organic life an origin in the inorganic materials of the primitive earth (pristine mud). The doctrine of Anaximenes, who unites the conceptions of a determinate and indeterminate original substance adopted by Thales and Anaximander in the hypothesis of a primordial and all-generating air, is a clear advance on these theories, inasmuch as it introduces the scientific idea of condensation and rarefaction as the great generating or transforming agencies. For the rest, his theory is chiefly important as emphasizing the vital character of the original substance. The primordial air is conceived as animated. Anaximenes seems to have inclined to a view of cosmic evolution as throughout involving a quasi-spiritual factor. This idea of the air as the original principle and source of life and intelligence is much more clearly expressed by a later writer, Diogenes of Apollonia. Diogenes made this conception of a vital and intelligent air the groundwork of a teleological view of climatic and atmospheric phenomena. It is noteworthy that he sought to establish the identity of organic and inorganic matter by help of the facts of vegetal and animal nutrition. Diogenes distinctly taught that the world is of finite duration, and will be renewed out of the primitive substance.

Hercules again deserves a prominent place in a history of the idea of evolution. Heraclitus conceives of the incessant process of flux in which all things are involved as consisting of two sides or moments—generation and decay—which are regarded as a confluence of opposite streams. In thus making transition or change, viewed as the identity of existence and non-existence, the leading idea of his system, Heraclitus anticipated in some measure Hegel's peculiar doctrine of evolution as a dialectic process. At the same time we may find expressed in figurative language the germs of thoughts which enter into still newer doctrines of evolution. For example, the notion of conflict (ὅμως) as the father of all things and of harmony arising out of a union of discords, and again of an endeavour by individual things to maintain themselves in permanence against the universal process of destruction and renovation, cannot but remind one of certain fundamental ideas in Darwin's theory of evolution.

**Empedocles.***—Empedocles took an important step in the direction of modern conceptions of physical evolution by teaching that all things arise, not by transformations of some primitive form of matter, but by various combinations of a number of permanent elements. Further, by maintaining that the elements are continually being combined and separated by the two forces love and hatred, which appear to represent in a figurative way the physical forces of attraction and repulsion, Empedocles may be said to have made a considerable advance in the construction of the idea of evolution as a strictly mechanical process. It may be observed, too, that the hypothesis of a primitive compact mass (σφαιρα), in which love (attraction) is supreme, has some curious points of similarity to, and contrast with, that notion of a primitive nebulous matter with which the modern doctrine of cosmic evolution usually sets out. Empedocles tries to explain the genesis of organic beings, and, according to Lange, he anticipates the idea of Darwin that adaptations are due, because it is their nature to perpetuate themselves. He further recognizes a progress in the production of vegetable and animal forms, though this part of his theory is essentially crude and unscientific. More important in relation to the modern problems of evolution is his thoroughly materialistic way of explaining the origin of sensation and knowledge by help of his peculiar hypothesis of effluvia and pores. The supposition that sensation thus rests on a material process of absorption from external bodies naturally led up to the idea that plants and even inorganic substances are precipitant, and so to an indirect recognition of organic life as a sort of self-created motion.

**Atomists.**—In the theory of Atomism taught by Leucippus and Democritus we have the basis of the modern mechanical conceptions of cosmic evolution. Here the endless harmonious diversity of our cosmos, as well as of other worlds supposed to coexist with our own, is said to arise through the various combinations of indivisible material elements differing in figure and magnitude only. The force which brings the atoms together in the forms of objects is inherent in the elements, and all their motions are necessary. The origin of things, which is also their substance, is thus laid in the simplest and most homogeneous elements or principles. The real world thus arising consists only of diverse combinations of atoms, having the properties of magnitude, figure, weight and hardness, all other qualities being relative only to the sentient organism. The problem of the genesis of mind is practically solved by identifying the soul,

---

1 This is brought out by F. Lassalle, *Die Philosophie Herakleitos*, p. 126.
or vital principle, with heat or fire which pervades in unequal proportions, not only man and animals, but plants and nature as a whole, and through the agitation of which by incoming effluvia all sensation arises.

*Aristotle.*—Aristotle is much nearer a conception of evolution than his master Plato. It is true he sets out with a transcendent Deity, and follows Plato in viewing the creation of the cosmos as a process of transformation from the more to the less perfect according to the distance from the original self-moving agency. Yet on the whole Aristotle leans to a teleological theory of evolution, which he interprets dualistically by means of certain metaphysical distinctions. Thus even his idea of the relation of the divine activity to the world shows a tendency to a pantheistic notion of a divine thought which gradually realizes itself in the process of becoming. Aristotle’s distinction of form and matter, and his conception of becoming as a transition from actuality to potentiality, provides a new ontological way of conceiving the process of material and organic evolution. To Aristotle the whole of nature is instinct with a vital impulse towards some higher manifestation. Organic life presents itself to him as a progressive scale of complexity determined by its final end, namely, man. In some respects Aristotle approaches the modern view of evolution. Thus, though he looked on species as fixed, being the realization of an unchanging formative principle (physis), he seems, as Ueberweg observes, to have inclined to entertain the possibility of a spontaneous generation in the case of the lowest organisms. Aristotle’s teleological conception of organic evolution often approaches modern mechanical conceptions. Thus he says that nature fashions organs in the order of their necessity, the first being the essence of all life. So, too, in his psychology he speaks of the several degrees of mind as arising according to a progressive necessity. In his view of touch and taste, as the two fundamental and essential senses, he may remind one of Herbert Spencer’s doctrine. At the same time Aristotle precludes the idea of a natural development of the mental series by the supposition that man contains, over and above a natural finite soul inseparable from the body, a substantial and eternal principle (soul) which enters into the individual from without. Aristotle’s brief suggestions respecting the origin of social and political institutions in the *Politics* show a leaning to a naturalistic interpretation of human life as a development conditioned by growing necessities.

*Strato.*—Of Aristotle’s immediate successors one desires to be noticed here, namely, Strato of Lampsacus, who developed his master’s cosmology into a system of naturalism. Strato appears to reject Aristotle’s idea of an original source of movement and life extraneous to the world in favour of an immanent principle. All parts of matter have an inward plastic life whereby they can fashion themselves to the best advantage, according to their capability, though not with consciousness.

*The Stoics.*—In the cosmology of the Stoics we have the germ of a monistic and pantheistic conception of evolution. All things are said to be developed out of an original being, which is at once material (fire) and spiritual (the Deity), and in turn they will dissolve back into this primordial source. At the same time the world as a developed whole is regarded as an organism which is permeated with the divine Spirit, and so we may say that the world-process is a self-realization of the divine Being. The formative principle or force of the world is said to contain the several rational germinal forms of things. Individual things are supposed to arise out of the original being, as animals and plants out of seeds. Individual souls are also conceived as the all-comprising world-soul. The necessity in the world’s order is regarded by the Stoics as identical with the divine reason, and this idea is used as the basis of a teleological and optimistic view of nature. Very curious, in relation to modern evolutionary ideas, is the Stoical doctrine that our world is but one of a series of exactly identical ones, all of which are destined to be burned up and destroyed.

*The Epicureans.*—Lucretius.—The Epicureans differed from the Stoics by adopting a purely mechanical view of the world-process. Their fundamental conception is that of Democritus; they seek to account for the formation of the cosmos, with its order and regularity, by setting out with the idea of an original distribution of the atoms, which somehow or other results in movements towards and from one another. Our world is but one of an infinite number of others, and all the harmonies and adaptations of the universe are regarded as a special case of the infinite possibilities of mechanical events. Lucretius regards the primitive atoms (first beginnings or first bodies) as seeds out of which individual things are developed. All living and sentient things are formed out of insentient atoms (e.g. worms spring out of dung). The peculiarity of organic and sentient bodies is due to the minuteness and shape of their particles, and to their special motions and combinations. So, too, mind consists but of extremely fine particles of matter, and dissolves into a few atoms when the body dies. Lucretius traces, in the fifth book of his poem, the progressive genesis of vegetal and animal forms out of the mother-earth. He vaguely anticipates the modern idea of the world as a survival of the fittest when he says that many races may have lived and died out, and that those which still exist have been protected either by craft, courage or speed. Lucretius touches on the development of man out of a primitive, hardy, beast-like condition. Pregnant hints are given respecting a natural development of language which has its germ in sounds associated with acts and objects, of religious ideas out of dreams and waking hallucinations, and kindred phenomena. It is the suggestion of natural sounds. Lucretius thus recognizes the whole range of existence to which the doctrine of evolution may be applied.

*Neo-Platonists.*—In the doctrines of the Neoplatonists, of whom Plotinus is the most important, we have the world-process represented after the example of Plato as a series of descending steps, each being less perfect than its predecessors, since it is further removed from the first cause. The system of Plotinus, Zeller remarks, is not strictly speaking one of evolution, for the world is from the point of view of the most perfect principle of the divine essence to the created world; yet it resembles emanation inasmuch as the genesis of the world is conceived as a necessary physical effect, and not as the result of volition. In Proclus we find this conception of an emanation of the world out of the Deity, or the absolute, made more exact, the process being regarded as threefold,—(1) persistence of cause in effect, (2) the departure of effect from cause, and (3) the tendency of effect to revert to its cause.

*The Fathers.*—The speculations of the fathers respecting the origin and course of the world seek to combine Christian ideas of the Deity with doctrines of Greek philosophy. The common idea of the origin of things is that of an absolute creation of matter and mind alike. The course of human history is regarded by those writers who are most concerned to refute Judaism as a progressive divine education. Among the Gnostics we meet with the hypothesis of emanation, as, for example, in the curious cosmic theory of Valentinus.

*Middle Ages.*—Early Schoolmen.—In the speculative writings of the middle ages, including those of the schoolmen, we find no progress towards a more accurate and scientific view of nature. The cosmology of the schoolmen is in the main part of the Aristotelian teleological view of nature combined with the Christian idea of the Deity and His relation to the world. In certain writers, however, there appears a more elaborate transformation of the doctrine of creation into a system of emanation. According to John Scotus Erigena, the nothing out of which the world is created is the divine essence. Creation is the act by which God passes through the primordial causes, or universal ideas, into the region of particular things (præcessio), in order finally to return to himself (reversio). The transition from the
universal to the particular is of course conceived as a descent or degradation. A similar doctrine of emanation is to be found in the writings of Bernhard of Chartres, who conceives the process of the unfolding of the world as a movement in a circle from the most general to the individual, and from this back to the most general. This movement is said to go forth from God to the animated heaven, stars, visible world and man, which represent decreasing degrees of cognition.

Arab Philosophers.—Elaborate doctrines of emanation, largely based on Neoplatonic ideas, are also propounded by some of the Arab philosophers, as by Fārābī and Avicenna. The leading thought is that of a descending series of intelligences, each emanating from its predecessor, and having its appropriate region in the universe.

Jewish Philosophy.—In the Jewish speculations of the middle ages may be found curious forms of the doctrine of emanations uniting the Biblical idea of creation with elements drawn from the Persians and the Greeks. In the later and developed form of the Kabbala, the origin of the world is represented as a gradually descending emanation of the lower out of the higher. Among the philosophic Jews, the Spanish Avicenra, in his Fons Vitae, expounds a curious doctrine of emanation. Here the divine will is viewed as an efflux from the divine wisdom, as the intermediate link between God, the first substance, and all things, and as the fountain out of which all forms emanate. At the same time all forms, including the higher intelligible ones, are said to have their existence only in matter. Matter is the one universal substance, body and mind being merely specifications of this. Thus Avicenra approaches, as Salomon Munk observes, a pantheistic conception of the world, though he distinctly denies both matter and form to God.

Later Scholastics.—Passing now to the later scholastics, a bare mention must be made of Thomas Aquinas, who elaborately argues for the absolute creation of the world out of nothing, and of Albertus Magnus, who reasons against the Aristotelian idea of the past eternity of the world. More importance attaches to Duns Scotus, who brings prominently forward the idea of a progressive development in nature by means of a process of determination. The original substance of the world is the materia prima-prima, which is the immediate creation of the Deity. This serves Duns Scotus as the most universal basis of explanation, all higher having material bodies. This matter is differentiated into particular things (which are not privations but perfections) through the addition of an individualizing principle (haecceitas) to the universal (quidditas). The whole world is represented by the figure of a tree, of which the seeds and roots are the first indeterminate matter, the leaves the accidents, the twigs and branches corruptible creatures, the blossoms the rational soul, and the fruit pure spirits or angels. It is also described as a bifurcation of two twigs, mental and bodily creation out of a common root. One might almost say that Duns Scotus recognizes the principle of a gradual physical evolution, only that he chooses to represent the mechanism by which the process is brought about by means of quaint scholastic fictions.

Revival of Learning.—The period of the revival of learning, which was also that of a renewed study of nature, is marked by a considerable amount of speculation respecting the origin of the universe. In some of these we see a return to Greek theories, though the influence of physical discoveries, more especially those of Copernicus, Kepler and Galileo, is distinctly traceable.

Telesio.—An example of a return to early Greek speculation is provided by Giordano Telesio. By this writer the world is explained as a product of the divine principle—the final cause, and two active forces, heat and cold. Terrestrial things arise through a confluence of heat, which issues from the heavens, and cold, which comes from the earth. Both principles have sensibility, and thus all products of their collision are sentient, that is, feel pleasure and pain. The superiority of animals to plants and metals in the possession of special organs of sense is connected with the greater complexity and heterogeneity of their structure.

Milanges de philosophie juive et arabe, p. 225.

Giordano Bruno.—In the system of Giordano Bruno, who sought to construct a philosophy of nature on the basis of new scientific ideas, more particularly the doctrine of Copernicus, we find the outlines of a theory of cosmic evolution conceived as an essentially vital process. Matter and form are here identified, and the evolution of the world is presented as the unfolding of the world-spirit to its perfect forms according to the plastic substratum (matter) which is but one of its sides. This process of change is conceived as a transformation, in appearance only, of the unchanging substance (matter and form). All parts of matter are capable of developing into all forms; thus the materials of the table and chair may under proper circumstances be developed to the life of the plant or of the animal. The elementary parts of existence are the minima, or monads, which are at once material and mental. On their material side they are not absolutely unextended, but spherical. Bruno looked on our solar system as but one out of an infinite number of worlds. His theory of evolution is essentially pantheistic, and he does not employ his hypothesis of monads in order to work out a more mechanical conception.

Campanella.—A word must be given to one of Bruno's contemporaneous philosophers, namely Campanella, who gave poetic expression to that system of universal vitalism which Bruno developed. He argues, from the principle quiquis est in effectibus esse et in causis, that the elements and the whole world have sensation, and thus he appears to derive the organic part of nature out of the so-called "inorganic."

Boehme.—Another writer of this transition period deserves a passing reference here, namely, Jacob Boehme the mystic, who by his conception of a process of inner demerit as the essential character of all minds, and of God, prepared the way for later German theories of the origin of the world as the self-differentiation and self-externalization of the absolute spirit.

Hobbes and Gassendi.—The influence of an advancing study of nature, which was stimulated if not guided by Bacon's writings, is seen in the more careful doctrines of materialism worked out almost simultaneously by Hobbes and Gassendi. These theories, however, contain little that bears directly on the hypothesis of a natural evolution of things. In the view of Hobbes, the difficulty of the genesis of conscious minds is solved by saying that sensation and thought are part of the reaction of the organism on external movement. Yet, he (following Clarenius and Claude points out) to have vaguely felt the difficulty; and in a passage of his Physics (ch. 25, sect. 5) he says that the universal existence of sensation in matter cannot be disproved, though he shows that when there are no organic arrangements the mental side of the movement (phantasma) is evanescent. The theory of the origin of society put forth by Hobbes, though directly opposed in most respects to modern ideas of social evolution, deserves mention here by reason of its enforcing that principle of struggle (belium omnium contra omnes) which has played so conspicuous a part in the modern doctrine of evolution. Gassendi, with some deviations, follows Epicurus in his theory of the formation of the world. The world consists of a finite number of atoms, which have in their own nature a self-moving force or principle. These atoms, which are the seeds of all things, are, however, not eternal but created by God. Gassendi distinctly argues against the existence of a world-soul or a principle of life in nature.

Descartes.—In the philosophy of Descartes we meet with a dualism of mind and matter which does not easily lend itself to the conception of evolution. His doctrine that consciousness is confined to man, the lower animals being automatons (automata), excludes all idea of a progressive development of mind. Yet Descartes, in his Principia Philosophiae, laid the foundation of the modern mechanical conception of nature and of physical evolution. In the third part of this work he inclines to a thoroughly natural hypothesis respecting the genesis of the physical world, and adds in the fourth part that the same kind of explanation might be applied to the nature and formation of plants and animals. He is indeed careful to keep right with
the orthodox doctrine of creation by saying that he does not believe the world actually arose in this mechanical way out of the three kinds of elements which he here supposes, but that he simply puts out his hypothesis as a mode of conceiving how it might have arisen. Descartes's account of the mind and its passions is thoroughly materialistic, and to this extent he works in the direction of a materialistic explanation of the origin of mental life.

Spinoza.—In Spinoza's pantheistic theory of the world, which regards thought and extension as but two sides of one substance, the problem of becoming is submerged in that of being. Although Spinoza's theory attributes a mental side to all physical events, he rejects all teleological conceptions and explains the order of things as the result of an inherent necessity. He recognizes gradations of things according to the degree of complexity of their movements and that of their conceptions. To Spinoza (as Kuno Fischer observes) man differs from the rest of nature in the degree only and not in the kind of his powers. So far Spinoza approaches the conception of evolution. He may be said to furnish a further contribution to a metaphysical conception of evolution in his view of all finite individual things as the infinite variety to which the unlimited productive power of the universal substance gives birth. Sir F. Pollock has taken pains to show how nearly Spinoza approaches certain ideas contained in the modern doctrine of evolution, as for example that of self-preservation as the determining force in this, the web of nature.

Locke.—In Locke we find, with a retention of certain anti-evolutionist ideas, a marked tendency to this mode of viewing the world. To Locke the universe is the result of a direct act of creation, even matter being limited in duration and created. Even if matter were eternal it would, he thinks, be incapable of producing motion; and if motion is itself conceived as eternal, thought can never begin to be. The first eternal being is thus spiritual or "cognitive," and contains in itself all the perfections that can ever after exist. He repeatedly insists on the impossibility of senseless matter putting on sense. Yet while thus placing himself at a point of view opposed to that of a gradual evolution of the organic world, Locke prepared the way for this doctrine in more ways than one. First of all, his genetic method as applied to the mind's ideas—which laid the foundations of English analytical psychology—was a step in the direction of a conception of mental life as a gradual evolution. Again he works towards the same end in his celebrated refutation of the scholastic theory of real specific essences. In this argument he emphasizes the vagueness of the boundaries which mark off organic species with a view to show that these do not correspond to absolutely fixed divisions in the objective world, that they are made by the mind, not by nature. This idea of the continuity of species is developed more fully in a remarkable passage (Essay, bk. iii. ch. vi. § 12), where he is arguing in favour of the hypothesis, afterwards elaborated by Leibnitz, of a graduated series of minds (species of spirits) from the Deity down to the lowest animal intelligence. He here observes that "all quite down from us the descent is by easy steps, and a continued series of things, that in each remove differ very little from one another." Thus man approaches the beasts, and the animal kingdom is nearly joined with the vegetable, and so on down to the lowest and most inorganic parts of matter. Finally, it is to be observed that Locke had a singularly clear view of organic arrangements (which of course he explained according to a teleistic teleology) as an adaptation to the circumstances of the environment or to the "neighbourhood of the bodies that surround us." Thus he suggests that man has not eyes of a microscopic delicacy, because he would receive no great advantage from such acute organs, since though adding indefinitely to his speculative knowledge of the physical world they would not practically benefit their possessor (e.g. by enabling him to avoid things at a convenient distance). 4

Idea of Progress in History.—Before leaving the 17th century we must just refer to the writers who laid the foundations of the essentially modern conception of human history as a gradual upward progress. According to Flint, 4 there were four men who in this and the preceding century seized and made prominent this idea, namely, Bodin, Bacon, Descartes and Pascal. The former distinctly argues against the idea of a deterioration of man in the past. In this way we see that just as advancing natural science was preparing the way for a doctrine of physical evolution, so advancing historical research was leading to the application of a similar idea to the collective human life.

English Writers of the 18th Century—Hume.—The theological discussions which make up so large a part of the English speculation of the 18th century cannot detain us here. There is, however, one writer who sets forth so clearly the alternative suppositions respecting the origin of the world that he claims a brief notice. We refer to David Hume. In his Dialogues concerning Natural Religion he puts forward tentatively, in the person of one of his interlocutors, the ancient hypothesis that since the world resembles an animal or vegetal organism rather than a machine, it might more easily be accounted for by a process of generation than by an act of creation. Later on he develops the materialistic view of Epicurus, only modifying it so far as to conceive of matter as finite. Since a finite number of particles is only susceptible of finite transpositions, it must always remain in whatever form it may be, and the kind or order or position will be tried an infinite number of times, and hence this world is to be regarded (as the Stoics maintained) as an exact reproduction of previous worlds. The speaker seeks to make intelligible the appearance of art and contrivance in the world as a result of a natural settlement of the universe (which passes through a succession of chaotic conditions) into a stable condition, having a constancy in its forms, yet without its several parts losing their motion and fluctuation.

French Writers of the 18th Century.—Let us now pass to the French writers of the 18th century. Here we are first struck by the results of advancing physical speculation in their bearing on the conception of the world. Careful attempts, based on new scientific truths, are made to explain the genesis of the world as a natural process. Maupertuis, who, together with Voltaire, introduced the new idea of the universe as based on Newton's discoveries, sought to account for the origin of organic things by the hypothesis of sentient atoms. Buffon the naturalist speculated, not only on the structure and genesis of organic beings, but also on the course of formation of the earth and solar system, which he conceived after the analogy of the development of organic beings out of seed. Diderot, too, in his varied intellectual activity, found time to speculate on the genesis of sensation and thought out of a combination of matter endowed with an elementary kind of sentience. De la Mettrie worked out a materialistic doctrine of the origin of things, according to which sensation and consciousness are nothing but a development out of matter. He sought (L'Homme-machine) to connect man in his original condition with the lower animals, and emphasized (L'Homme-plante) the essential unity of plan of all living things. Helvétius, in his work on man, referred all differences between our species and the lower animals to certain peculiarities of organization, and so prepared the way for a conception of human development out of lower forms as a process of physical evolution. Charles Bonnet met the difficulty of the origin of conscious beings much in the same way as Leibnitz, by the supposition of eternal minute organic bodies to which are attached immortal souls. Yet though in this way opposing himself to the method of the modern doctrine of evolution, he aided the development of this doctrine by his view of the organic world as an ascending sequence of living beings.

A similar coincidence between the teleological and the modern evolutionary point of view is found in the account of the use of pain in relation to the preservation of our being (bk. ii. ch. vii. sect. 4). 5

Philosophy of History (1893), p. 105, where an interesting sketch of the growth of the idea of progress is to be found.
scale from the simple to the complex. Robinet, in his treatise *De la nature*, worked out the same conception of a gradation in organic existence, connecting this with a general view of nature as a progress from the lowest inorganic forms of matter up to man. The process is conceived as an infinite series of variations or specifications of one primitive and common type. Man is the chef-d'œuvre of nature, which the gradual progression of beings was to have as its last term, and all lower creations are regarded as pre-conditions of man's existence, since nature "could only realize the human form by combining in all imaginable ways each of the terms which was to enter into it." The forceive force in this process of evolution (or "metamorphosis") is conceived as an intellectual principle (idée génératrice). Robinet thus laid the foundation of that view of the world as wholly vital, and as a progressive unfolding of a spiritual formative principle, which was afterwards worked out by Schelling. It is to be added that Robinet adopted a thorough-going materialistic view of the dependence of mind on body, going even to the length of assigning special nerve-fibres to the moral sense. The system of Holbach seeks to provide a consistent materialistic view of the world and its processes. Mental operation is nothing but physical motion, and the combinations of physical movement, inertia, attraction and repulsion, being in the moral world self-love, love and hate. He left open the question whether the capability of sensation belongs to all matter, or is confined to the combinations of certain materials. He looked on the actions of the individual organism and of society as determined by the needs of self-preservation. He conceived of man as a product of nature that had gradually developed itself from a low condition, though he relinquished the problem of the exact mode of his first genesis and advance as not soluble by data of experience. Holbach thus worked out the basis of a rigorously materialistic conception of evolution.

The question of human development which Holbach touched on was one which occupied many minds both in and out of France during the 18th century, and more especially towards its close. The foundations of this theory of history as an upward progress of man out of a barbaric and animal condition were laid by Vico in his celebrated work *Principi di scienza nuova*. In France the doctrine was represented by Turgot and Condorcet. The German Writers of the 18th Century—Leibnitz.—In Leibnitz we find, if not a doctrine of evolution in the strict sense, a theory of the monads as continuously related to the modern doctrine. The chief aim of Leibnitz is not a doctrine to account for the world in its static aspect as a co-existent whole, to conceive the ultimate reality of things in such a way as to solve the mystery of mind and matter. Yet by his very mode of solving the problem he is led on to consider the nature of the world-process. By placing substantial reality in an infinite number of monads whose essential nature is force or activity, which is conceived as mental (representation), Leibnitz was carried on to the explanation of the successive order of the world. He prepares the way, too, for a doctrine of evolution by his monistic idea of the substantial similarity of all things, inorganic and organic, bodily and spiritual, and still more by his conception of a perfect gradation of existence from the lowest "inanimate" objects, whose essential activity is confused representation, up to the highest organized being—man—with his clear intelligence. Turning now to Leibnitz's conception of the world as a process, we see first that he supplies, in his notion of the underlying reality as force which is represented as spiritual (quelque chose d'analogique au sentiment et à l'appétit), both a mechanical and a teleological explanation of its order. More than this, Leibnitz supposes that the activity of the monads takes the form of a self-evolution. It is the following out of an inherent tendency or impulse to a series of changes, all of which were virtually pre-existent, and this process cannot be interfered with from without. As the individual monad, so the whole system which makes up the world is a gradual development. In this case, however, we cannot say that each step goes out of the other as in that of individual development. Each monad is an original independent being, and is determined to take this particular point in the universe, this place in the scale of beings. We see how different this metaphysical conception is from that scientific notion of cosmic evolution in which the lower stages are the antecedents and conditions of the higher. It is probable that Leibnitz's notion of time and space, which approaches Kant's theory, led him to attach but little importance to the successive order of the world. Leibnitz, in fact, presents to us an infinite system of perfectly distinct though parallel worlds, which on their mental side assume the aspect of a scale, not through any mutual action, but solely through the determination of the Deity. Even this idea, however, is incomplete, for Leibnitz fails to explain the physical aspect of development. Thus he does not account for the fact that organic beings—which have always existed as preformations (in the case of animals as animaux spermatiques)—come to be developed under given conditions. Yet Leibnitz prepared the way for a new conception of organic evolution. The modern monistic doctrine, that all material things consist of sentient elements, and that the reality of these elements arises through a combination of these, was a natural transformation of Leibnitz's philosophy.

Lessing.—Of Leibnitz's immediate followers we may mention Lessing, who in his *Education of the Human Race* brought out the truth of the process of gradual development underlying human history, even though he expressed this in a form inconsistent with the idea of a spontaneous evolution.

Herder.—Herder, on the other hand, Lessing's contemporary, treated the subject of man's development in a thoroughly naturalistic spirit. In his *Ideen zur Philosophie der Geschichte*, Herder adopts Leibnitz's idea of a graduated scale of beings, at the same time conceiving of the lower stages as the conditions of the higher. This scale is said to be the highest product of nature, and as such to be dependent on all lower products. All material things are assimilated to one another as organic, the vitalizing principle being inherent in all matter. The development of man is explained in connexion with that of the earth, and in relation to climatic variations, &c. Man's mental faculties are viewed as related to his organization, and as developed under the pressure of the necessities of life.3

Kant.—Kant's relation to the doctrine of evolution is a many-sided one. In the first place, his peculiar system of sub-realityism, involving the idea that time is but a mental form to which there corresponds nothing outside it, or a noumenal reality, serves to give a peculiar philosophical interpretation to every doctrine of cosmic evolution. Kant, like Leibnitz, seeks to reconcile the mechanical and teleological views of nature, only he assigns to these different spheres. The order of the inorganic world is explained by proper physical causes. In his *Naturgeschichte des Himmels*, in which he anticipated the nebular theory afterwards more fully developed by Laplace, Kant sought to explain the genesis of the cosmos as the result of many physical forces and laws. The worlds, or systems of worlds, which fill infinite space are continually being formed and destroyed. Chaos passes by a process of evolution into a cosmos, and this again into chaos. So far as the evolution of the solar system is concerned, Kant held these mechanical causes as adequate. For the world as a whole, however, he postulated a beginning in time (whence his use of the word creation), and further supposed that the impulse of organization which was conveyed to chaotic matter by the Creator issued from a central point in the infinite space spreading gradually outwards.4 While

1 Both Lewes and du Bois-Reymond have brought out the points of contact between Leibnitz's theory of monads and modern biological speculations (Hist. of Phil. ii. 287, and Leibnitzische Gedanken in der modernen Naturwissenschaft, p. 23 seq.).

2 Kant held that it probable that other planets besides our earth are inhabited, and that their inhabitants form a scale of beings, their perfection increasing with the distance of the planet which they inhabit from the sun.
in his cosmology Kant thus relies on mechanical conceptions, in his treatment of organic life his mind is, on the contrary, dominated by teleological ideas. An organism was to him something controlled by a formative organizing principle. It was natural, therefore, that he rejected the idea of a spontaneous generation of organisms (which was just then being advocated by his friend Forster), not only as unsupported by experience but as an inadequate hypothesis. Experience forbids our excluding organic activity from natural causes, also our excluding intelligence from purposeful (zwecktägigen) causes; hence experience forbids us defining the fundamental force or first cause out of which living creatures arose. Just as Kant thus sharply marks off the regions of the inorganic and the organic, so he sets man in strong opposition to the lower animals. His ascription to man of a unique faculty, free-will, forbade his conceiving our species as a link in a graduated series of organic developments. In his doctrine of human development he does indeed recognize an early stage of existence in which our species was dominated by sense-perception and instinct. He further conceives of this stage as itself a process of (natural) development, namely, of the natural disposition of the species to vary in the greatest possible manner so as to preserve its unity through a process of self-adaptation (Anpassung) to climate. This, he says, must not be conceived as resulting from the action of external causes, but is due to a natural disposition (Anlage). From this capability of natural development (which already involves a teleological idea) Kant distinguishes the power of moral self-development or self-liberation from the dominion of nature, the gradual realization of a unique identity of the human race. The moral development is regarded as a gradual approach to that rational, social and political state in which will be realized the greatest possible quantity of liberty. Thus Kant, though he appropriated and gave new form to the idea of human progress, conceived of this as wholly distinct from a natural (mechanical) process. In this particular, as in his view of organic actions, Kant distinctly opposed the idea of evolution as one universal process swaying alike the physical and the moral world.

Schelling.—In the earlier writings of Schelling, containing the exposition of his doctrine of identity, existence is represented as insomuch, or process of evolution. Nature and mind (which are the two sides, or polar directions, of the one absolute) are each viewed as an activity advancing by an uninterrupted succession of stages. The side of this process which Schelling worked out most completely is the negative side, that is, nature. Nature is essentially a process of organic self-evolution. It can only be understood by subordinating the mechanical conception to the vital, by conceiving the world as one organism animated by a spiritual principle or intelligence (Willetssee). From this point of view the processes of nature from the inorganic up to the most complex of the organic become stages in the self-realization of nature. All organic forms are at bottom but one organization, and the inorganic world shows the same formative activity in various degrees or potencies. Schelling conceives of the gradual self-evolution of nature in a succession of higher and higher forms as brought about by a limitation of her infinite productivity, showing itself in a series of points of arrest. The detailed exhibition of the organizing activity of nature in the several processes of the organic and inorganic world rests on a number of fanciful and unscientific ideas. Schelling's theory is a bold attempt to revitalize nature in the light of growing physical and psychological science, and by so doing to comprehend the unity of the world under the idea of one principle of organic development. His highly figurative language might leave us in doubt how far he conceived the higher stages of this evolution of nature as following the lower in time. In the introduction to his work *Von der Weltssee*, however, he argues in favor of the possibility of a transmutation of species in periods incommensurable with ours. The evolution of mind (the positive pole) proceeds by way of three stages—theoretic, practical and aesthetical activity. Schelling's later theosophic speculations do not specially concern us here.

Followers of Schelling.—Of the followers of Schelling a word or two must be said. Heinrich Steffens, in his Anthropologie, seeks to trace out the origin and history of man in connexion with a general theory of the development of the earth, and this again as related to the formation of the solar system. All these processes are regarded as a series of manifestations of a vital principle in higher and higher forms. Oken, again, who carries Schelling's ideas into the region of biological science, seeks to reconstruct the gradual evolution of the material world out of original matter, which is the first immediate appearance of God, or the absolute. This process is an upward one, through the formation of the solar system and of our earth with its inorganic bodies, up to the production of man. The process is essentially a polar linear action, or differentiation from a common centre. By means of this process the bodies of the solar system separate to themselves, and the order of cosmic evolution is repeated in that of terrestrial evolution. The organic world (like the world as a whole) arises out of a primitive chaos, namely, the infusorial slime. A somewhat similar working out of Schelling's idea is to be found in H. C. Oersted's work entitled *The Soul in Nature* (Eng. trans.). Of later works based on Schelling's doctrine of evolution mention may be made of the volume entitled *Natur und Idee*, by G. F. Carus. According to this writer, existence is nothing but a becoming, and matter is simply the momentary product of the process of becoming, while force is this process continuing, and the increasing unity. With Hegel the absolute is itself a dialectic process which contains within itself a principle of progress from difference to difference and from unity to unity. "This process (W. Wallace remarks) knows nothing of the distinctions between past and future, because it implies an eternal present." This conception of an immanent organic union of the nature of all beings, beginning with the geological organism—or the mineral kingdom, plants and animals. Yet this process of development is not to be conceived as if one stage is naturally produced out of the other, and not even as if the one followed the other in time. Only spirit has a history; in nature all forms are contemporaneous. Hegel's interpretation of mind and history as a process of evolution has more scientific interest than his conception of nature. His theory of the development of free-will (the objective spirit), which takes its start from Kant's conception of history, with its three stages of legal right, morality as determined by motive and instinctive goodness (Sittlichkeit), might almost as well be expressed in terms of a thoroughly naturalistic doctrine of human development. So, too, some of his conceptions respecting the development of art and religion (the absolute spirit) lend themselves to a similar interpretation. Yet while, in its application to history, Hegel's theory of evolution has points of resemblance with those doctrines which seek to explain the world-process as one unbroken progress occurring in time, it constitutes on the whole a theory apart and sui generis. It does not conceive of the organic as succeeding on the inorganic, or of conscious life constituting
EVOLUTION

as conditioned in time by lower forms. In this respect it resembles Leibnitz's idea of the world as a development; the idea of evolution is in each case a metaphysical as distinguished from a scientific one. Hegel gives a place in his metaphysical system to the mechanical and the teleological views; yet in his treatment of the world as an evolution the idea of end or purpose is the predominant one.

Of the followers of Hegel who have worked out his peculiar idea of evolution it is hardly necessary to speak. A bare reference may be made to J. K. F. Rosenkranz, who in his work Hegel's Naturphilosophie seeks to develop Hegel's idea of an earthly organism in the light of modern science, recognizing in crystallization the morphological element.

Schopenhauer.—Of the other German philosophers immediately following Kant, there is only one who calls for notice here, namely, Arthur Schopenhauer. This writer, by his conception of the world as will which objectifies itself in a series of gradations from the lowest manifestations of matter up to conscious man, gives a slightly new shape to the evolutionary view of Schelling, though he deprives this view of its optimistic character by denying any co-operation of intelligence in the world-process. In truth, Schopenhauer's conception of the world as the activity and degree of force is at bottom a materialistic and mechanical rather than a spiritualistic and teleological theory. Moreover, Schopenhauer's subjective idealism, and his view of time as something illusory, hindered him from viewing this process as a sequence of events in time. Thus he ascribes eternity of existence to species under the form of the "Platonic idea." As Ludwig Noiré observes, Schopenhauer has no feeling for the origin of the organic beings. He says Lamarck's original animal is something metaphysical, not physical, namely, the will to live. "Every species (according to Schopenhauer) has of its own will, and according to the circumstances under which it would live, determined its form and organization,—yet not as something physical in time, but as something metaphysical out of time."

Von Baer.—Before leaving the German speculation of the first half of the century, a word must be said of von Baer, whose biological contributions we shall refer later in this article, who recognized in the law of development the law of the universe as a whole. In his Entwieklungsgeschichte der Thiere (p. 264) he distinctly tells us that the law of growing individuality is "the fundamental thought which goes through all forms and degrees of animal development and all single relations. It is the same thought which collected in the cosmic space the divided masses into spheres, and combined those to solar systems; the same which caused the weather-beaten dust on the surface of our metallic planet to spring forth into living forms." Von Baer thus prepared the way for Herbert Spencer's generalization of the law of organic evolution as the law of all evolution.

Comte.—As we arrive at the 19th century, though yet before the days of Darwin, biology is already beginning to affect the general aspect of thought. It might suffice to single out the influence of Auguste Comte, the last great thinker who were before Hegel to permeate philosophic speculation. Though Comte did not actually contribute to a theory of cosmic organic evolution, he helped to lay the foundations of a scientific conception of human history as a natural process of development determined by general laws of human nature together with the accumulating influences of the past. Comte does not recognize that this process is aided by any increase of innate capacity; on the contrary, progress is to him the unfolding of fundamental faculties of human nature which always pre-existed in a latent condition; yet he may perhaps be said to have prepared the way for the new conception of human progress by his inclusion of mental laws under biology.

Development of the Biological Doctrine.—In the 19th century the doctrine of evolution received new biological contents and became transformed from a vague, partly metaphysical theory to the dominant modern conception. At this point it is convenient to leave the guidance of Professor J. Sully and to follow closely T. H. Huxley, who in the 9th edition of this encyclopaedia traced the history of the growth of the biological idea of evolution from its philosophical beginnings to its efflorescence in Charles Darwin.

In the earlier half of the 19th century the term "evolution" was introduced into biological writings in order to denote the mode in which some of the most eminent physiologists of that time conceived that the generation of living things took place; in opposition to the hypothesis advocated, in the preceding century, by W. Harvey in that remarkable work¹ which would give him a claim to rank among the founders of biological science, even had he not been the discoverer of the circulation of the blood.

One of Harvey's prime objects is to defend and establish, on the basis of direct observation, the opinion already held by Aristotle, that, in the higher animals at any rate, the formation of the new organism by the process of generation takes place, not suddenly, by simultaneous accretion of rudiments of all or the most important of the organs of the adult, nor by sudden metamorphosis of a formative substance into a miniature of the whole, which subsequently grows, but by epigenesis, or successive differentiation of a relatively homogeneous rudiment into the parts and structures which are characteristic of the adult.

"Et primo, quidem, quoniam per epigenesis sive partum superexternum additamentum pullum fabricari certum est: quoniam pars ante alias omnes extratur, et quid de illa ejusque generandi principium?... Sed postea cuncta esse originem cuiuslibet animalium, si manifeste apparet quod Aristoteles de perfectorum animantium generatione emuntit: nimirum, non omnes partes simul fieri, sed ordine alium post aliam; primunque existere particulam genitalem, cujus virtute postea (tantum ex principio quodam) reliques omnes partes prostatant. Qualem in plantarum seminibus (labis, putis, aut glandibus) gommmam sive apicem protuberrantem cernimus, totius futurae arboris principium. Estque hsec partula velut fetus emanatipus seorsumque collocatus, et principium per se magis; unde postea membrorum ordo describitor; et quaequecumque ad absolutum animal pertinent, disponuntur? Quoniam enim nulla pars se ipsum generat, sed sive generat aliquem, sive aliquem ex alterius, sive aliquem ex omni non hume, si vis habeas vegetandam, sive nutrendam, sive reliquis omnis partes sive quoniam ordine distinguit et formet; proindeque in cadu primo genitica anima primario inest, sensus, motusque, et totius vitae auctor et principium."

(Exercitatio 51.)

Harvey proceeds to contrast this view with that of the "Medici," or followers of Hippocrates and Galen, who, "badly philosophizing," imagined that the brain, the heart, and the liver were simultaneously first generated in the form of vesicles; and, at the same time, while expressing his agreement with Aristotle in the principle of epigenesis, he mentions with the blood which is the primal generative part, and not, as Aristotle thought, the heart.

In the latter part of the 17th century the doctrine of epigenesis thus advocated by Harvey was controverted on the ground of direct observation by M. Malpighi, who affirmed that the body of the chick is to be seen in the egg before the punctum sanguinum makes it appearance. But from this perfectly correct observation a conclusion which is by no means warranted was drawn, namely, that the chick as a whole really exists in the egg antecedent to the hatching of the albumen. Moreover, if Malpighi's observations be true, he has shown that the egg must be the initial stage of the whole as a whole and not as a sequence of parts, "alias post alias natas," as Harvey puts it, but a simple expansion or unfolding of the organs which already exist, though they are too small and inconspicuous to be discovered. The weight of Malpighi's observations therefore fell into the scale of that doctrine which Harvey terms metamorphosis, in contradistinction to epigenesis.

The views of Malpighi were warmly welcomed on philosophical grounds by Leibnitz,² who found in them a support to his

¹ The Exercitaciones de generatione animalium, which Dr George Ent extracted from him and published in 1651.
² De generatione animalium, lib. ii. cap. iv.
³ Cependant, pour revenir aux formes ordinaires ou aux armes matières de cette durée, il leur faut attribuer, à la place de ce que l'attribué aux atomes pourrait faire duire si elles ne vont pas de corps en corps; ce qui serait la métempsycose, à peu près comme quelques philosophes ont cru la transmission du mouvement.
hypothesis of monads, and by Nicholas Malebranche; while, in the middle of the 18th century, not only speculative considerations, but a great number of new and interesting observations on the phenomena of generation, led the ingenious Charles Bonnet and A. von Haller, the first physiologist of the age, to adopt, advocate and extend them.

In the meantime, before fertilization, the hen's egg contains an excessively minute but complete chick; and that fertilization and incubation simply cause this germ to absorb nutritious matters, which are deposited in the interstices of the elementary structures of which the miniature chick, or germ, is made up. The consequence of this insusceptible growth is the "development" or "evolution" of the germ into the visible bird. Thus an organized individual (tout organisme) is a composite body consisting of the original, or *elementary*, parts and of the matters which have been associated with them by the aid of nutrition; so that if the germ when mature, or an organic being is simply a process of enlargement, as a particle of dry gelatine may be swelled up by the insusceptibility of water; its death is a shrinkage, such as the swelling jelly might undergo on desiccation. Nothing really new is produced in the living world, but the germs which develop have existed since the beginning of things; and nothing really dies, but, when what we call death takes place, the living thing shrinks back into its germ state.

et celle des espèces. Mais cette imaginaison est bien éloignée de la nature des choses. Il n'y a point de tel passage; et c'est ici où les transformations de Messieurs Swammerdam, Malpighi, et Leeuenhoek, qui sont des plus excellens observateurs de notre temps, sont venues à mon secours et m'ont fait admettre plus aisément, que l'animal, et toute autre substance organisée ne commence point l'erreur et le croire, et que sa génération apparente n'est qu'un développement et une espèce d'augmentation. Aussi ai-je remarqué que l'auteur de la Recherche de la vérité, M. Regis, M. Hartscker, et d'autres hautes personnes n'ont pas été fort éloignés dans ce sens, et que le philosophe himself, comme nous l'avons dit, a trouvé dans l'Empereur de Meurans, que l'embryon jusqu'à n'adhérer qu'à la nature (1668). The doctrine of "Emboltement" is contained in the *Considerations sur le principe de vie* (1705); the preface to the *Théodicée* (1710); and the *Principes de physiologie* (§ 6) (1712).

Il est vrai que la pensée la plus raisonnable et la plus conforme à l'expérience sur cette question très difficile de la formation du foetus, c'est que les êtres sont presque tout formés avant même que ces parties soient créées; et qu'ils n'ont plus qu'à acquérir la forme, et que leur donner l'accroissement ordinaire dans le temps de la grossesse." *De la recherche de la vérité*, livre ii. chap. vii. p. 334 (7th ed., 1721).

1. *Considerations sur les corps organisés*, chap. x.

2. Bonnet had the courage of his opinions, and in the *Palingénésie philosophique*, part vi. chap. iv., he develops a hypothesis which he terms "évolution naturelle"; and which, making allowance for his peculiar views of the nature of generation, bears no small resemblance to what is understood by "evolution" at the present day.

3. Si la volonté divine a créé par un seul Acte l'Universalité des êtres, et n'a donné ordre aux plantes et aux animaux d'agir que sous ses lois, nous devrions permettre de dire Production au troisième et au cinquième jour du renouvellement de notre monde?

4. Abuseraons-nous de la liberté de conjectures si je disais, que les plantes et les animaux qui existent aujourd'hui sont parvenus par une sorte d'évolution naturelle des êtres organisés qui peuplèrent ce premier Monde, sorti immédiatement des MAINS DU CRÉATEUR ?... "

5. "Ce mot (germe) ne désignerait pas seulement un corps organisé visible en petit; il désignerait encore toute espèce de préformation originelle dont un tout organique peut résulter comme de son principe divinatif." —Palingénésie philosophique, part. x. chap. ii.

6. "M. Cuvier considérant que tous les êtres organisés sont dérivés de parents, et ne voyant dans la nature aucune force capable de produire l'organisation, croyait à la pré-existence des germes; non pas de la forme, mais de l'âme tout entière. Un tout organique est bien évident que c'est que par des développemens successifs que l'âme acquiert sa forme; mais, si l'on peut s'exprimer ainsi, à la pré-existence de la radical du germe, radical qui existe avant que la série des évolution ne s'ait commencée; et c'est là la belle observation de Bonnet, à plusieurs générations." —Laurillard, *Éloge de Cuvier*, note 12.

successors. The school of Cuvier was lamentably deficient in embryologists; and it was only in the course of the first thirty years of the 19th century that Prévost and Dumas in France, and, later on, Döllinger, Pander, von Bär, Rathke, and Remak in Germany, founded modern embryology; and, at the same time, proved the utter incompatibility of the hypothesis of evolution as formulated by Bonnet and Haller with easily demonstrable facts.

Nevertheless, though the conceptions originally denoted by “evolution” and “development” were shown to be untenable, the words retained their application to the process by which the embryos of living beings gradually make their appearance; and the terms “development,” “Entwicklung,” and “évolution” are now indiscriminately used for the series of genetic changes exhibited by living beings, by writers who would emphatically deny that “development” or “Entwicklung” or “évolution,” in the sense in which these words were usually employed by Bonnet or Haller, ever occurs.

Evolution, or development, is, in fact, at present employed in biology as a general name for the history of the steps by which any living being has acquired the morphological and the physiological characters which distinguish it. As civil history may be divided into biography, which is the history of individuals, and universal history, which is the history of the human race, so evolution falls naturally into two categories—the evolution of the individual (see Embryology) and the evolution of the sum of living beings.

The Evolution of the Sum of Living Beings.—The notion that all the kinds of animals and plants may have come into existence by the growth and modification of primordial germs is as old as speculative thought; but the modern scientific form of the doctrine can be traced historically to the influence of several converging lines of philosophical speculation and of physical observation, none of which go further back than the 17th century. These are:

1. The enunciation by Descartes of the conception that the physical universe, whether living or not living, is a mechanism, and that, as such, it is explicable on physical principles.

2. The observation of the gradations of structure, from extreme simplicity to very great complexity, presented by living things, and of the relation of these graduated forms to one another.

3. The observation of the existence of an analogy between the series of gradations presented by the species which compose any great group of animals or plants, and the series of embryonic conditions of the highest members of that group.

4. The observation that large groups of species of widely different habits present the same fundamental plan of structure; and that parts of the same animal or plant, the functions of which are very different, likewise exhibit modifications of a common plan.

5. The observation of the existence of structures, in a rudimentary and apparently useless condition, in one species of a group, which are fully developed and have definite functions in other species of the same group.

6. The observation of the effects of varying conditions in modifying living organisms.

7. The observation of the facts of geographical distribution.

8. The observation of the facts of the geological succession of the forms of life.

Nevertheless, notwithstanding the elaborate disguise which fear of the powers that were led Descartes to throw over his real opinions, it is impossible to read the Principes de la philosophie without acquiring the conviction that this great philosopher held that the physical world and all things in it, whether living or not living, have originated by a process of evolution, due to the continuous operation of purely physical causes, out of a primitive relatively formless matter.1

The following passage is especially instructive:

“Et tant s'en faut que je veuille que l'on croie toutes les choses que je écriai, que meme je pretends en proposer ici quelques-unes que je crois absolument feusses: a savoir, je ne doute point pourtant que le monde n'ait ete cree a l' commencement avec autant de perfection qu'il en a; en sorte que le soleil, la terre, la lune, et les etoiles ont ete des lors; et que la terre n'a pas eu seulement en soi les semences des plantes, mais que les plantes meme en ont tourné une partie; et qu'Adam et Eve n'ont pas ete crees ensens mais en age d'hommes parfaits. La religion chrétienne veut que nous le croyons ainsi, et la raison naturelle nous persuade entierement cette vérité; car si nous considerons la toute puissance de Dieu, nous devons juger que tout ce qu'il a fait a eu dès le commencement toute la perfection qu'il devoir avoir. Mais néanmoins, comme on connoit beaucoup mieux quelle a ete la nature d'Adam et celle des arbres de Paradis si on ait examiné comment les enfants se feront peu a peu dans le ventre de leurs mères et comment les plantes sortent de leurs semences, que si on ait seulement considéré quels ils ont été quand Dieu les a creés: tout de meme, nous femon mieux entendre quelle est généralement la nature de toutes les choses qui sont au monde si nous pouvons imaginer quelques principes qui soient fort intelligibles et fort simples, desquels nous tirerons clairement que les astres et la terre et enfin le monde visible auront pu être produit ainsi que de quelques semences (bien que nous sachions qu'il n'a pas été produit en cette façon) que si nous la décrivions seulement comme il est, ou bien comme nos croyons qu'il a été créé. Et parce que je pense pas avoir trouvé des principes qui sont tels, je tacherai ici de les expliquer.”2

If we read between the lines of this singular exhibition of force of one kind and weakness of another, it is clear that Descartes believed that he had divined the mode in which the physical universe had been evolved; and the Traité de l'homme and the essay Sur les passions afford abundant additional evidence that he sought for, and thought he had found, an explanation of the phenomena of physical life by deduction from purely physical laws.

Spinoza abounds in the same sense, and is as usual perfectly candid—

“Naturae leges et regulae, secundum quas omnia sunt et ex unis formas in alias mutantur, sunt ubique et semper cadet.”

Leibnitz's doctrine of continuity necessarily led him in the same direction; and, of the infinite multitude of monads with which he peopled the world, each is supposed to be the focus of an endless process of evolution and involution. In the Prælectiones, xxvi., Leibnitz distinctly suggests the mutability of species—

“Alli mirantur in saxis passim species videri quas vel in orbe cognito, vel saltem in vicinis locis frustra quaerant. Ita Cornu Ammonis, quae ex nautilor numero habebantur, passim et forma et magnitudine (nam et pedali diametro aliquando repeririuntur) absque dicitur naturae, etiam quandocumque quisque, hoc absconditus ejus recessus aut subterraneas abyssos pervestigavit? quum multa nobis animalia antea ignota operne novis orbis? Et credibile est per magnas ilias conversiones etiam animallium species quas inimico timuit existimaverat.”

The use of this in the end of the 17th century the seed was sown which has at intervals brought forth recurrent crops of evolutionary hypotheses, based, more or less completely, on general reasons.

Among the earliest of these speculations is that put forward by Benoit de Maillélet in his Telleiam, which, though printed in 1735, was not published until twenty-three years later. Considering that this book was written before the time of Haller, or Bonnet, or Linnaeus, or Hutton, it surely deserves more respectful consideration than it usually receives. De Maillélet not only has a definite conception of the plasticity of living things, and of the production of existing species by the modification of their predecessors, but he clearly apprehends the cardinal maxims of modern geological science, that the explanation of the structure of the globe is to be sought in the deductive application to geological phenomena of the principles established inductively by the study of the present course of nature. Somewhat later, P. L. M. de Maupertuis suggested a curious hypothesis as to the causes of variation, which he thinks may be sufficient to account for the origin of all animals descenent from common origin.

1 As Buffon has well said—"L'idée de ramener l'explication de tous les phénomènes à des principes mécaniques est assurément grande et belle, ce pas le plus hardi qu'on peut faire en philosophie, et c'est Descartes qui l'a faite."—La g. p. 50.

2 Principes de la philosophie, Troisième partie, § 45.

1 Ethicus, Pars tertia, Praefatio.

from a single pair. Jean Baptiste René Hocinet followed out much the same line of thought as De Maillet, but less soberly; and Bonnet's speculations in the Polangeiist, which appeared in 1760, have already been mentioned. Buffon (1735-1778), at first a partisan of the absolute immutability of species, subsequently appears to have believed that larger or smaller groups of species have been produced by the modification of a primitive stock; but he contributed nothing to the general doctrine of evolution.

Erasmus Darwin (Zoonomia, 1794), though a zealous evolutionist, can hardly be said to have made any real advance on his predecessors; and, notwithstanding the fact that Goethe had written one of the best known of all treatises on evolution, he did not throw a true insight into their significance, while he threw all the power of a great poet into the expression of his conceptions, it may be questioned whether he supplied the doctrine of evolution with a firmer scientific basis than it already possessed. Moreover, whatever the value of Goethe's labours in that field, they were not published before 1820, long after evolutionism had taken a new departure from the works of Treviranus and Lamarck—the first of its advocates who were equipped for their task with the needful large and accurate knowledge of the phenomena of life. It is remarkable that the researches of these writers seem to have been led, independently and contemporaneously, to invent the same name of "biology" for the science of the phenomena of life; and thus, following Buffon, to have recognized the essential unity of these phenomena, and their contrastive from those of inanimate nature. And it is hard to say whether Lamarck or Treviranus has the priority in propounding the main thesis of the doctrine of evolution; for though the first volume of Treviranus's Biologie appeared only in 1802, he says, in the preface to his later work, the Erörterungen und Gesetze des organisichen Lebens, dated 1831, that he was the first to publish the Biologie "nearly five-and-thirty years ago," or about 1796.

Now, in 1794, there is evidence that Lamarck held doctrines which present a striking contrast to those which are to be found in the Philosophie zoologique, as the following passages show:

"685. Quoique mon unique objet dans cet article n’ait été que de traiter de la cause physique de l’entretien de la vie des êtres organiques, malgré cela j’ai osé avancer en débattant, que l’existence de ces êtres étonnants n’appartient nullement à la nature; que tout ce qu’on peut entendre par le mot nature, ne pouvoit donner la vie, c’est-à-dire, que toutes les qualités de la matière, jointes à toutes les circonstances possibles, et même à l’activité répandue dans l’univers, ne pouvoient point produire un être muni du mouvement organique, capable de reproduire son semblable, et sujet à la mort.

"686. Tous les individus de cette nature, qui existent, proviennent d’individus semblables qui tous ensemble constituent l’espèce entière. Or, je crois qu’il est aussi impossible à l’homme de connaître la cause physique du premier individu de chaque espèce, que d’assigner aussi physiquement la cause de l’existence de la matière ou de l’univers entier. C’est au moins ce que le résultat de mes connaissances et de mes réflexions me portent à penser. S’il existe beaucoup de variétés produites par l’effet des circonstances, ces variétés ne déterminent point les espèces; mais on se trompe, sans doute souvent, en indiquant comme espèce, ce qui n’est que variété; et encore on ne peut conclure de ces erreurs apparentes, que l’on fasse sur cette matière."

The first three volumes of Treviranus's Biologie, which contains his general views of evolution, appeared between 1802 and 1805. The Recherches sur l'organisation des corps vivants, which sketches out Lamarck's doctrines, was published in 1802; but the full development of his views in the Philosophie zoologique did not take place until 1809.

The Biologie and the Philosophie zoologique are both very remarkable productions, and are still worthy of attentive study, but they fell upon evil times. The rationalist philosophy which appeared in support of the traditionally respectable hypotheses of special creation and of catastrophism; and the wild speculations of the Discours sur les révolutions de la surface du globe were held to be models of sound scientific thinking, while the really much more sober and philosophical hypotheses of the Hydrobiologie were scouted. For many years it was the fashion to speak of Lamarck with ridicule, while Treviranus was altogether ignored.

Nevertheless, the work had been done. The conception of evolution was herculean irrepressible, and it incessantly reappeared, and one scientist after another, of minor or greater eminence, as Charles Darwin and A. R. Wallace published their Theory of Natural Selection. The Origin of Species appeared in 1859; and thenceforward the doctrine of evolution assumed a position and acquired an importance which it never before possessed. In the Origin of Species, and in his other numerous and important contributions to the solution of the problem of biological evolution, Darwin confined himself to the discussion of the causes which have brought about the present condition of living matter, assuming such matter to have once come into existence. Wallace, moreover, and it was first put forward in his paper on the whole problem of evolution. The profound and vigorous writings of Spencer embody the spirit of Descartes in the knowledge of our own day, and may be regarded as the Principes de la philosophie of the 19th century; while, whatever hesitation may not unfrequently be felt by less daring minds in following Haeckel in many of his speculations, his attempt to systematize the doctrine of evolution and to exhibit its influence as the central thought of modern biology, cannot fail to have a far-reaching influence on the progress of science.

If we turn for the reason of the difference between the scientific position of the doctrine of evolution, first of Lamarck and that which it occupies now, we shall find it in the great accumulation of facts, the several classes of which have been enumerated above, under the second to the eighth heads. For those which are grouped under the second to the seventh of these classes, respectively, have a clear significance on the hypothesis of evolution, while they are unintelligible if that hypothesis be denied. And those of the eighth group are not only unintelligible without the assumption of evolution, but can be proved never to be discordant with that hypothesis, while, in the eight, the doctrine of the échelle des êtres, so powerfully and clearly stated by Bonnet, and, before him, adumbrated by Locke and by Leibnitz. In the then state of knowledge, it appeared that all the species of animals and plants could be arranged in one series, in such a manner that, by insensible gradations, the mineral passed into the plant, the plant into the polyne, the polyne into the worm, and so, through gradually higher forms of life, to man, at the summit of the animated world.

But, as knowledge advanced, this conception ceased to be tenable in the crude form in which it was first put forward. Taking into account existing animals and plants alone, it became obvious that they fell into groups which were more or less sharply separated from one another; and, moreover, that even...
the species of a genus can hardly ever be arranged in linear series. Their natural resemblances and differences are only to be expressed by disposing them as if they were branches springing from a common hypothetical centre.

Lamark, while affirming the verbal proposition that animals form a single series, was forced by his vast acquaintance with the details of zoology to limit the assertion to such a series as may be formed out of the abstractions constituted by the common characters of each extremity of the series.

Cuvier on anatomical, and Von Baer on embryological grounds, made the further step of proving that, even in this limited sense, animals cannot be arranged in a single series, but that there are several distinct plans of organization to be observed among them, no one of which, in its highest and most complicated modification, leads to any of the others.

The conclusions enunciated by Cuvier and Von Baer have been confirmed in principle by all subsequent research into the structure of animals and plants. But the effect of the adoption of these conclusions has been rather to substitute a new metaphor for that of Bonnet than to abolish the conception expressed by it. Instead of regarding living things as capable of arrangement in one series like the steps of a ladder, the results of modern investigation compel us to dispose them as if they were the twigs and branches of a tree. The ends of the twigs represent individuals, the smallest groups of twig species, larger groups genera, and so on, until we arrive at the source of all these ramifications of the main branch, which is represented by a common plan of structure. At the present moment it is impossible to draw up any definition, based on broad anatomical or developmental characters, by which any one of Cuvier's great groups shall be separated from all the rest. On the contrary, the lower members of each tend to converge towards the lower members of all the others. The same may be said of the vegetable world. The apparently clear distinction between flowering and flowerless plants has been broken down by the series of gradations between the two exhibited by the Lycopodiaceae, Rhizocarpaceae, and Gymnospermae. The groups of Fungi, Lichenes and Algse have completely run into one another, and, when the lowest forms of each are alone considered, even the animal and vegetable kingdoms cease to have a definite frontier.

If it is permissible to speak of the relations of living forms to one another, there can hardly be any doubt that the great groups must undoubtedly be that of a common root, whence two main trunks, one representing the vegetable and one the animal world, spring; and, each dividing into a few main branches, these subdivide into multitudes of branchlets and these into smaller groups of twigs.

As Lamark has well said:

"Il n'y a que ceux qui se sont longtemps et fortement occupés de la détermination des espèces, et qui ont consulté de riches collections, qui peuvent savoir jusqu'à quel point les espèces, parmi les corps vivants, se fondent les unes dans les autres, et qui ont pu se convaincre que, dans les parties où nous voyons des espèces isolées, cela n'est ainsi que parce qu'ils nous en manque d'autres qui en sont plus voisines. Il est vrai que nous avons pas encore recueillis:

Je ne veux pas dire pour cela que les animaux qui existent forment une série très-simple et partout également nuancée; mais je dis qu'ils forment un ensemble de groupes tels que l'un d'eux n'a point de discontinuité dans ses parties, ou qui, du moins, en a toujours pas eu, s'il est vrai que, par suite de quelques espèces perdues, il s'en trouve quelque part. Il en résulte que les espèces qui forment un ensemble de groupes tels que l'un d'eux n'a point de discontinuité dans ses parties, ou qui, du moins, en a toujours pas eu.

Voici ce que j'établis connu des choses me met maintenant à portée de démontrer. Je n'ai besoin d'aucune hypothèse ni d'aucune supposition pour cela; je n'attends plus des critiques observateurs."

3. In a remarkable essay,3 Meckel remarks:

"There is no good physiologist who has not been struck by the observation that the original form of all organisms is one and the same, and that out of this one form, all, the lowest as well as the highest, are developed in such a manner that the latter pass through all the intermediate forms as transitory stages. Aristotle, Haller, Harvey, Kleimeyer, Autenrieth, and many others have either made this observation incidentally, or, especially the latter, have drawn particular attention to it, and drawn therefrom results of permanent importance for physiology."

Meckel proceeds to exemplify the thesis, that the lower forms of animals represent stages in the course of the development of the higher, with a host of examples.

After comparing the salamanders and the perennibranchiate Urodela with the tadpoles and the frogs, and enunciating the law that the more highly any animal is organized the more quickly does it pass through the lower stages, Meckel goes on to say:

"From these lowest Vertebrata to the highest, and to the highest forms among these, the comparison between the embryonic conditions of the higher animals and the adult states of the lower can be more completely and thoroughly investigated than if the survey is extended to the Invertebrata, insomuch as the latter are in many respects constructed upon one another too dissimilarly; indeed they often differ from one another far more than the lowest vertebrate does from the highest mammal; yet the following pages will show that the comparison may be extended to them with interest. In fact, there is a period when, as Aristotle long ago said, the embryo of the highest animal has the form of a mere worm, and, devoid of all the organs which make the animal what it is, is merely a mere lump of poly-embryonic substance. Notwithstanding the origin of organs, it still for a certain time, by reason of its want of an internal bony skeleton, the remains widely differs from the embryo and only later enters into the series of the Vertebrata, although traces of the vertebral column even in the earliest periods testify its claim to a place in that series."—Op. cit. pp. 4-5.

If Meckel's proposition is so far qualified, that the comparison of adult with embryonic forms is restricted within the limits of one type of organization; and if it is further recollected, that the resemblance between the permanent lower form and the embryonic stage of a higher form is not special but general, it is in entire accordance with modern embryology; although there is no branch of biology which has grown so largely, and improved its methods so much since Meckel's time, as this. In its original form, the doctrine of "arrest of development," as advocated by Geoffroy Saint-Hilaire and Serres, was no doubt an overstatement of the case. It is not true, for example, that a fish is a reptile arrested in its development, or that a reptile was ever a fish; but it is true that the reptile embryo, at one stage of its development, is an organism which, if it had an independent existence, must be classified among fishes; and all the organs of the reptile pass, in the course of their development, through conditions which are closely analogous to those which are permanent in some fishes.

The branch of zoology which is termed morplogy is a commentary upon, and expansion of, the proposition that widely different animals or plants, and widely different parts of animals or plants, are constructed upon the same plan. From the rough comparison of the skeleton of a bird with that of a man by Pierre Delon, in the 16th century (to go no further back), down to the theory of the limbs and the theory of the skull at the present day; or, from the first demonstration of the homologies of the parts of a flower by C. F. Wolff, to the present elaborate analysis of the floral organs, morphology exhibits a continual advance towards the demonstration of a fundamental unity in the seeming diversities of living structures. And this demonstration has been completed by the final establishment of the cell theory (see Cytoology), which involves the admission of a primitive conformity, not only of the entire elementary structures in animals and plants respectively, but of those in the one of these great divisions of living things with those in the other.

No a priori difficulty can be said to stand in the way of evolution, when it can be shown that all animals and all plants proceed by modes of development, which are similar in principle, from a fundamental protoplasmic material.

5. The innumerable cases of structures, which are rudimentary and apparently useless, in species, the close allies of which possess well-developed and functionally important homologous
structures, are readily intelligible on the theory of evolution, while it is hard to conceive their raison d'être on any other hypothesis. However, a cautious reasoner will probably rather explain such cases deductively from the doctrine of evolution than endeavour to support the doctrine of evolution by them. For it is almost impossible to prove that any structure, however rudimentary, is useless—that is to say, that it plays no part whatever in the economy; and, if it is in the slightest degree useful, there is no reason why, on the hypothesis of direct creation, it should not have been created. Nevertheless, double-edged as is the argument from rudimentary organs, there is probably none which has produced a greater effect in promoting the general acceptance of the theory of evolution.

6. The older advocates of evolution sought for the causes of the process exclusively in the influence of varying conditions, such as climate and station, or hybridization, upon living forms. Even Trevisanus has got no further than this point. Lamarck introduced the conception of the action of an animal on itself as a factor in producing modification. Starting from the well-known fact that the habitual use of a limb tends to develop the muscles of the limb, and to produce a greater and greater facility in using it, he made the general assumption that the effort of an animal to exert an organ in a given direction tends to develop the organ in that direction. But a little consideration showed that, though Lamarck had seized what, as far as it goes, is a true cause of modification, it is a cause the actual effects of which are wholly inadequate to account for any considerable modification in animals, and which can have no influence at all in the vegetable world; and probably nothing contributed so much to discredit evolution, in the early part of the 19th century, as the floods of easy ridicule which were poured upon this part of Lamarck's speculations. The theory of natural selection, or survival of the fittest, was suggested by William Charles Wells in 1813, and further elaborated by Patrick Matthew in 1831. But the pregnant suggestions of these writers remained practically unnoticed and forgotten, until the theory was independently devised and promulgated by Charles Robert Darwin and Alfred Russell Wallace in 1838, and the effect of its publication was immediate and profound.

Those who were unwilling to accept evolution, without better grounds than such as are offered by Lamarck, and who therefore preferred to suspend their judgment on the question, found in the principle of selective breeding, pursued in all its applications with marvellous knowledge and skill by Darwin, a valid explanation of the occurrence of varieties and races; and they saw clearly that, if the explanation would apply to species, it would not only solve the problem of their origin, but that it would account for the facts of teleology, as well as for those of morphology; and for the persistence of some forms of life unchanged through long epochs of time, while others undergo comparatively rapid metamorphosis.

How far "natural selection" suffices for the production of species remains to be seen. Few can doubt that, if not the whole cause, it is a very important factor in that operation; and that it must play a great part in the sorting out of varieties into those which are transitory and those which are permanent.

In like conditions of variation have yet to be thoroughly explored; and the importance of natural selection will not be impaired, even if further inquiries should prove that variability is definite, and is determined in certain directions rather than in others, by conditions inherent in that which varies. It is quite conceivable that every species tends to produce varieties of a limited number and kind, and that the effect of natural selection is to favour the development of some of these, while it opposes the development of others along their predetermined lines of modification.

7. No truths brought to light by biological investigation were better calculated to inspire distrust of the dogmas intruded upon science in the name of theology than those which relate to the distribution of animals and plants on the surface of the earth. Very skilful accommodation was needful, if the limitation of sloths to South America, and of the Ornithorhynchus to Australia, was to be reconciled with the literal interpretation of the history of the Deluge; and, with the establishment of the existence of distinct provinces of distribution, any serious belief in the peopling of the world by migration from Mount Ararat came to an end.

Under these circumstances, only one alternative was left for those who denied the occurrence of evolution; namely, the supposition that the characteristic animals and plants of each great province were created, as such, within the limits in which we find them. And as the hypothesis of "specific centres," thus formulated, was heterodox from the theological point of view, and unintelligible under its scientific aspect, it may be passed over without further notice, as a phase of transition from the creational to the evolutionary hypothesis.

8. In fact, the strongest and most conclusive arguments in favour of evolution are those which are based upon the facts of geographical, taken in conjunction with those of geological, distribution.

Both Darwin and Wallace lay great stress on the close relation which obtains between the existing fauna of any region and that of the immediately antecedent geological epoch in the same region; and rightly, for it is in truth inconceivable that there should be no genetic connexion between the two. It is possible to put into words the proposition, that all the animals and plants of each geological epoch were annihilated, and that a new set of very similar forms was created for the next epoch, but it may be doubted if any one who ever tried to form a distinct mental image of this process of spontaneous generation on the grandest scale ever really succeeded in realizing it.

In later years the attention of the best palaeontologists has been withdrawn from the hodman's work of making new species of fossils, to the scientific task of completing our knowledge of individual species, and tracing out the succession of the forms presented by any given type in time.

Evolution at the Beginning of the 20th Century.—Since Huxley and Sully wrote the 8th edition of this encyclopedia, the doctrine of evolution has outgrown the trammels of controversy and has been accepted as a fundamental principle. Writers on biological subjects no longer have to waste space in weighing evolution against this or that philosophical theory or religious tradition; philosophical writers have frankly accepted it, and the supporters of religious tradition have made broad their phylacteries to write on them the new words. A closer scrutiny of the writers of all ages who preceded Charles Darwin, and, in particular, the light thrown back from Darwin on the earlier writings of Herbert Spencer, have made plain that Darwin the world by this time might have come to a general acceptance of evolution; but it seems established as a historical fact that the world has come to accept evolution, first, because of Darwin's theory of natural selection, and second, because of Darwin's exposition of the evidence for the actual occurrence of organic evolution. The evidence as set out by Darwin has been added to enormously; new knowledge has in many cases altered our conceptions of the mode of the actual process of evolution, and from time to time a varying stress has been laid on what are known as the purely Darwinian factors in the theory. That the tendency of these tendencies has been again, but the development of great importance to sexual selection, and in favour of attaching a great importance to natural selection; but the dominant feature in the recent history of the theory has been its universal acceptance and the recognition that this general acceptance has come from the stimulus given by Darwin.

A change has taken place in the use of the word evolution. Huxley, following historical custom, devoted one section of his article to the "Evolution of the Individual." The facts and theories respecting this are now discussed under such headings as Embryology; Heredity; Variation and Selection; under these headings must be sought information on the important recent modifications with regard to the theory of the relation between the development of the individual and the development of the race, the part played by the environment on the individual, and the modern developments of the
old quarrel between evolution and epigenesis. The most striking general change has been against seeing in the facts of ontogeny any direct evidence as to phylogeny. The general proposition as to a parallelism between individual and ancestral development is no doubt indisputable, but extended knowledge of the very different ontogenetic histories of closely allied forms has led us to a much fuller conception of the mode in which stages in embryonic and larval history have been modified in relation to their surroundings, and to a consequent reluctance to attach detailed importance to the embryological argument for evolution.

The vast bulk of botanical and zoological work on living and extinct forms published during the last quarter of the 19th century increased almost beyond all expectation the relative weight of external evidence for the classification of animals into groups. The discovery of a single fossil creature in a geological stratum of a wrong period, the detection of a single anatomical or physiological fact irreconcilable with origin by descent with modification, would have been destructive of the theory and would have made the reputation of the observer. But in the prodigious number of supporting discoveries that have been made no single negative factor has appeared, and the evolution from their predecessors of the forms of life existing now or at any other period must be taken as proved. It is necessary to notice, however, that although the general course of the stream of life is certain, there is not the same certainty as to the exact time of the occurrence of the existing forms. In the attempts to place existing creatures in approximately phylogenetic order, a striking change, due to a more logical consideration of the process of evolution, has become established and is already resolving many of the earlier difficulties and banishing from the more recent tables the numerous hypothetical intermediate forms so familiar in the older phylogenetic trees. The older method was to attempt the comparison between the highest member of a lower group and the lowest member of a higher group—suppose, for example, that the gorilla and the chimpanzee, the highest members of the apes, were the existing representatives of the ancestors of man and to compare these forms with the lowest members of the human race. Such a comparison is necessarily illogical, as the existing apes are separated from the common ancestor by at least as large a number of generations as separate it from any of the forms of existing man. In the natural process of growth, the gap must necessarily be wider between the summits of the twigs than lower down, and, instead of imagining "missing links," it is necessary to trace each separate branch as low down as possible, and to institute the comparisons between the lowest points that can be reached. We may simplify the logical result of this by saying that every existing form of life stands at the summit of a long branch of the whole tree of life. A due consideration of it leads to the curious paradox that if any two animals be compared, the zoologically lower will be separated from the common ancestor by a larger number of generations, since, on the average, sexual maturity is reached more quickly by the lower form. Naturally very many other factors have to be considered, but this alone is a sufficient reason to restrain attempts to place existing forms in linear phylogenetic series. In embryology the method finds its expression in the limitation of comparisons to the corresponding stages of the systems involved by simultaneous attempts to place the comparisons between the adult stages of low forms and the embryonic stages of higher forms. Another expression of the same method, due to Cope, and specially valuable to the taxonomist, is that when the relationship between orders is being considered, characters of subordinal rank must be neglected. It must not be supposed that earlier writers all neglected this method, or still less that all writers now employ it, but merely that formerly it was frequently overlooked by the best writers, and now is neglected only by the worst. The result is, on the one hand, a clearing away of much fantastic phylogeny, on the other, an enormous reduction of the supposed gaps between groups.

There has been a renewed activity in the study of existing forms from the point of view of obtaining evidence as to the nature and origin of species. Comparative anatomists have been learning to refrain from basing the diagnosis of a species, or the description of the condition of an organ, on the evidence of a single specimen. Naturalists who deal specially with museum collections have been compelled, it is true, for other reasons to attach an increasing importance to what is called the type specimen, but they find that this insistence on the individual, although invaluable from the point of view of recording species, is unsatisfactory from the point of view of scientific zoology; and propositions for the amelioration of this condition of affairs range from a refusal of Linnaean nomenclature in such cases, to the institution of a division between master species for such species as have been properly revised by the comparative morphologist, and provisional species for such species as have been provisionally registered by those who work with the living form of which it is possible to obtain a large number of specimens, and those who make revisions of the provisional species of palaeontologists, are slowly coming to some such conception as that a species is the abstract central point around which a group of variations oscillate, and that the peripheral oscillations of one species may even overlap those of an allied species. It is plain that we have moved far from the connotation and denotation of the word species at the time when Darwin began to discuss the origin of species, and that the movement, on the one hand, tends to simplify the problem philosophically, and, on the other, to make it more difficult for the amateur theorist.

The conception of evolution is being applied more rigidly to the comparative anatomy of organs and systems of organs. When a series of the modifications of an anatomical structure has been sufficiently examined, it is frequently possible to decide that one particular condition is primitive, ancestral or central, and that the other conditions have been derived from it. Such a condition has been termed, with regard to the group of animals or plants or the organs of which are being studied, archecentric. The possession of the character in the archecentric condition is said to be possessed by all the members of the group does not indicate that these two numbers are more nearly related to one another than they are to other members of the group; the archecentric condition is part of the common heritage of all the members of the group, and may be retained by any. On the other hand, when the ancestral condition is modified, it may be regarded as having moved outwards along some radius from the archecentric condition. Such modified conditions have been termed apocentric. It is obvious that the mere apocentricity of a character may be no guide to the affinities of its possessor. It is necessary to determine if the modification is a simple change of the archecentric condition which has occurred in independent cases, in fact if it be a unidirectional apocentricity, or if it involved intricate and precisely combined anatomical changes that we could not expect to occur twice independently; that is to say, if it be a unidirectional apocentricity. Multidirectional apocentricities lie at the root of many of the phenomena that have been grouped under the designation convergence. Especially in the case of manifest adaptations, organs possessed by creatures far apart genealogically may be moulded into conditions that are extremely alike. Sir E. Ray Lankester's term, homoplasy, has passed into currency as designating such cases where different genetic material has produced structures in the same direction, but once specialized for different functions. The term has been adopted by biologists and is used to indicate a condition in which there is a high degree of similarity in the organs of different genera or species which have not been derived from common ancestors but in which the similarity results from parallelism. It is this sort of similarity which is often looked upon as evidence of a common ancestry. However, it is possible to produce a high degree of similarity in the organs of different genera or species which have not been derived from common ancestors but in which the similarity results from parallelism. It is this sort of similarity which is often looked upon as evidence of a common ancestry. However, it is possible to produce a high degree of similarity in the organs of different genera or species which have not been derived from common ancestors but in which the similarity results from parallelism. It is this sort of similarity which is often looked upon as evidence of a common ancestry. However, it is possible to produce a high degree of similarity in the organs of different genera or species which have not been derived from common ancestors but in which the similarity results from parallelism. It is this sort of similarity which is often looked upon as evidence of a common ancestry.
reveals its secondary nature by some small and apparently meaningless complexity.

Another group of investigations that seems to play an important part in the future development of the theory of evolution relates to the study of what is known as organic symmetry. The differentiation of structure that characterizes animals and plants are being shown to be orderly and definite in many respects; the relations of the various parts to one another and to the whole, the modes of repetition of parts, and the series of changes that occur in groups of repeated parts appear to be to a certain extent inevitable, to depend on the nature of the living material itself and on the necessary conditions of its growth. Closely allied to the study of symmetry is the study of the direct effect of the circumbibular media on embryonic young and adult stages of living beings (see EMBRYOLOGY: Physiology; Heredity; and Variation and Selection), and a still larger number of observers have added to our knowledge of these. It is impossible here to give even a list of the names of the many observers who in recent times have made empirical study of the effects of growth-forces and investigators of the symmetrical limitations and definitions of growth. It is to be noticed, however, that, even after such phenomena have been properly grouped and designated under Greek names as laws of organic growth, they have not become explanations of the series of facts they correlate. Their importance in the theory of evolution is none the less very great. In the first place, they lessen the number of separate facts to be explained; in the second, they limit the field within which explanation must be sought, since, for instance, if a particular mode of repetition of parts occur in mosses, in flowering-plants, in bees and in elephants, the seeker of ultimate explanations may exclude from the field of his inquiry all the conditions individual to these different organic forms, and confine himself only to what is common to all of them; that is to say, practically only the living material and its environment. The prosecution of such inquiries is beginning to make unnecessary much ingenious speculation of a kind that was prominent from 1880 to 1900; much futile effort has been wasted in the endeavour to find on Darwinian principles special "selection-values" for phenomena the universality of which places them outside the possibility of having relations with the particular conditions of particular organisms. On the other hand, many of those who have been specially successful in grouping diverse phenomena into empirical generalizations have erred logically in posing their generalizations against such a vera causa as the preservation of favoured individuals and races. The thirty years which followed the publication of the Origin of Species were characterized chiefly by anatomical and embryological work; since then there has been no diminution in anatomical and embryological enthusiasm, but many of the continually increasing body of investigators have turned again to bionomical work. Inasmuch as Lamarck attempted to frame a theory of evolution in which the principle of natural selection had no part, the interpretation placed on their work by many bionomical investigators recalls the theories of Lamarck, and the name Neo-Lamarckism has been used of such a school of biologists, particularly active in America. The weakness of the Neo-Lamarckian view lies in its interpretation of heredity; its strength lies in its zealous study of the living world and the detection therein of proximate empirical laws, a strength shared by very many bionomical investigations, the authors of which would prefer to call themselves Darwinsians, or to leave themselves without sectarian designation.

Statistical inquiry into the facts of life has long been employed, and in particular Francis Galton, within the Darwinian fold, has advocated the employment and developed its methods. Biological. Within quite recent years, however, a special school has arisen with the main object of treating the processes of evolution quantitatively. Here it is right to speak of Karl Pearson as a pioneer of notable importance. It has been the habit of biologists to use the terms variation, selection, elimination, correlation and so forth, vaguely; the new school, which has been strongly reinforced from the side of physical science, insists on quantitative measurements of the terms.

When the anatomist says that one race is characterized by long heads, another by round heads, the biometricist demands numbers and percentages. When an organ is stated to be variable, the biometricist demands statistics to show the range of the variations and the mode of their distribution. When a character is said to be favoured by natural selection, the biometricist demands investigation of the death-rate of individuals with or without the character. When a character is said to be transmitted, or to be correlated with another character, the biometricist declares the statement valueless without numerical estimations of the inheritance or correlation. The subject is still so new, and its technical methods (see Variation and Selection) have as yet spread so little beyond the group which is formulating and defining them, that it is difficult to do more than guess at the importance of the results likely to be gained. Enough, however, has already been done to show the vast importance of the method in grouping and codifying the empirical facts of life, and in so preparing the way for the investigation of ultimate causes of these facts.

The evolution of man appears to be the tendency to attach more meaning to the results than from their nature they can bear. The ultimate value of numerical inquiries must depend on the equivalence of the units on which they are based. Many of the characters that up to the present have been dealt with by biometrical inquiry are obviously composite. The height or length of the arm of a human being, for instance, is the result of many factors, some inherent, some due to environment, and until these have been sifted out, numerical laws of inheritance or of correlation can have no more than an empirical value. The analysis of composite characters into their indivisible units and statistical inquiry into the behaviour of the units would seem to be a necessary part of biometric investigation, and one to which much further attention will have to be paid.

It is well known that Darwin was deeply impressed by differences in flora and fauna, which seemed to be functions of locality, and not the result of obvious dissimilarities of environment. A. R. Wallace's studies of island life, and the work of many different observers on local races of animals and plants, marine, fluviatile and terrestrial, have brought about a conception of segregation as apart from differences of environment as being one of the factors in the differentiation of living forms. The segregation may be geographical, or may be the result of preferential mating, or of seasonal mating, and its effects plainly can be made no more of than proximate or empirical laws of differentiation, of great importance in codifying and simplifying the facts to be explained. The minute attention paid by modern systematists to the exact localities of subspecies and races is bringing together a vast store of facts which will throw further light on the problem of segregation, but the difficulty of utilizing these facts is increased by an unfortunate tendency to make locality itself one of the diagnostic characters. Consideration of phylogenetic series, especially from the palaeontological side, has led many writers to the conception that there is something of the nature of a growth-force inherent in organisms and tending inevitably towards divergent evolution. It is suggested that even in the absence of modification produced by any possible Darwinian or Lamarckian factors, that even in a neutral environment, divergent evolution of some kind would have occurred. The conception is necessarily somewhat hazy, but the words bathilism and bathic Evolution have been employed by a number of writers for some such conception. Closely connected with it, and probably underlying many of the facts which have led to it, is a more definite group of ideas that may be brought together under the phrase "phylogenetic limitation of variation." In its simplest form, this phrase implies such an obvious fact as that whatever be the future development of, say, existing cockroaches, it will be on lines determined by the present structure of these creatures. In a more general way, the phrase implies that at each successive branching of the tree of life, the branches become more specialized,...
more defined, and, in a sense, more limited. The full implications of the group of ideas require, and are likely to receive, much attention in the immediate future of biological investigation, but it is enough at present to point out that until the more obvious lines of inquiry have been opened out much work, we cannot be in a position to guess at the existence of a residuum, for which such a metaphysical conception as bathsmism would serve even as a convenient disguise for ignorance.

Almost every side of zoology has contributed to the theory of evolution, but of special importance are the facts and theories associated with the names of Gregor Mendel, A. Weismann and Hugo de Vries. These are discussed under the headings HEREDITY; MENDELISM; and VARIATION AND SELECTION. It has been a feature of great promise in recent contributions to the theory of evolution, that such contributions have received attention almost directly in proportion to the new methods of observation and the new series of facts with which they have come. These have found little favour who brought to the debate only formal criticisms or amplifications of the Darwinian arguments, or re-marshallings of the Darwinian facts, however ably conducted. The time has not yet come for the attempt to synthesize the results of the many different and often apparently antagonistic groups of workers. The great work that is going on is the simplification of the facts to be explained by grouping them under empirical laws; and the most general statement relating to these that can yet be made is that no single one of these laws has as yet shown signs of taking rank as a vera causa comparable with the Darwinian principle of natural selection.

For evolution in relation to society see SOCIOLOGY.

Nearly every major and zoological publication of recent date has its bearing on evolution. The following are a few of the more general works: Bateson, Materials for the Study of Variation; Bunge, Vitalismus and Mechanism; Cope, Origin of the Fittest, Primary Factors of Organic Evolution, Darwin's Life and Letters; H. de Vries, Species and Varieties and their Origin by Evolution; Eimer, Organic Evolution; Gullick, "Divergent Evolution through Cumulative Segregation," Jour. Linn. Soc. xx.; Haacke, Schöpfung der Menschen, Politische Werte der Zoologischen Charaktere, Trans. Linn. Soc. vili. pt. 7; Pearson, Grammar of Science; Romans, Darwin and after Darwin; Sedgwick, Presidential Address to Section Zoology, Brit. Ass. Rep. 1895; Wallace, Darwinism; Weismann, The Germ-Plasm. Further references of great value will be found in the works of Bateson and Pearson referred to above, and in the annual volumes of the Zoological Record, particularly under the head "General Subject." (P. C. M.)

EVORA, the capital of an administrative district in the province of Alemtejo, Portugal; 72 m. E. by S. of Lisbon, on the Casa Branca-Evora-Evora road. Pop. (1900) 16,020. Evora occupies a fertile valley enclosed by low hills. It is surrounded by a great part of the wall, which was never defended by two fortis; but the neglected condition of these, combined with the narrow arched streets and crumbling walls of Roman or Moorish masonry, gives the city an appearance corresponding with its real antiquity. Evora is the see of an archbishop, and has several churches, convents and hospitals, barracks, a diocesan school and a museum. A university, founded in 1530, was abolished on the expulsion of the Jesuits in the 18th century. The cathedral, originally a Romanesque building erected 1180-1204, was restored in Gothic style about 1400; its richly decorated chancel was added in 1764. The church, dedicated to St. Mary Magdalene, is a good example of the blended Moorish and Gothic architecture known as Manoelian. The art gallery, formerly the archbishop's palace, contains a collection of Portuguese and early Flemish paintings. An ancient tower, and the so-called aqueduct of Sertorius, 9 m. long, have been partly demolished to make room for the market-square, in which one of the largest fairs in Portugal is held at midsummer. Both tower and aqueduct were long believed to have been of Roman origin, but are now known to have been constructed about 1540-1555 in the reign of John III., at the instigation of a rich and influential citizen. The aqueduct was probably constructed on the site of the old Roman one. A small Roman temple is used as a public library; it is usually known as the temple of Diana, a name for which no valid authority exists. Evora is of little commercial importance, except as an agricultural centre, and its neighbourhood is famous for its mules and abounds in cork-woods; there are also mines of iron, copper, and asbestos and marble quarries. Under the old name of Evora, the city was from 80 to 72 B.C., the headquarters of Sertorius, and it long remained an important Roman military station. It was called Liberalitas Julia on account of certain municipal privileges bestowed on it by Julius Caesar (4. 100-44 B.C.). Its bishopric, founded in the 5th century, was raised to an archbishopric in the 16th. In 712 Evora was conquered by the Moors, who named it Jabura; and it was only retaken in 1166. From 1665 to 1665 it was held by the Spaniards. In 1832 Dom Miguel, retiring before Dom Pedro, took refuge in Evora; and here was signed the convention of Evora, by which the branch was banished. (See PORTUGAL.)

The administrative district of Evora includes the central part of Alemtejo (p.v.); pop. (1900) 128,062; area, 2856 sq. m. EVREUX, a town on north-western France, capital of the department of Eure, 67 m. W.N.W. of Paris on the Western railway to Cherbourg. Pop. (1906) town 13,773; commune, 18,971. Situated in the pleasant valley of the Iton, arms of which traverse it, the town, on the south, slopes upward to the public gardens and the railway station. It is the seat of a bishop, and its cathedral is one of the largest and finest in France. Part of the lower portion of the nave dates from the 11th century; the west façade with its two ungainly towers is, for the most part, the work of the late Renaissance; and various small interventions are represented in the rest of the church. A thorough restoration was completed in 1866. The elaborate north transept and portal are in the flamboyant Gothic; the choir, the finest part of the interior, is in an earlier Gothic style. Cardinal de la Belaye, bishop of Evreux in the latter half of the 15th century, constructed the octagonal central tower, with its elegant spire; to him is also due the Lady chapel, which is remarkable for some finely preserved stained glass. Two rose windows in the transepts and the carved wooden screens of the side chapels are masterpieces of 16th-century workmanship. The episcopal palace, a building of the 15th century, adjoins the south side of the cathedral. An interesting belfry, facing the handsome modern town hall, dates from the 13th century. The church of St. Taurin, in part Romanesque, has a choir of the 14th century and other portions of later date; it contains the shrine of St. Taurin, a work of the 13th century. At Vieil-Evreux, 31 m. south-east of the town, the remains of a Roman theatre, a palace, baths and an aqueduct have been discovered, as well as various relics which are now deposited in the museum of Evreux. Evreux is the seat of a prefect, a court of assizes, of tribunals of first instance, and of a chamber of commerce, a chamber of commerce and a board of trade arbitrators, and has a branch of the Chamber of Commerce, a lycée and training colleges for teachers. The making of tucking, boots and shoes, agricultural implements and gas motors, and metal-founding and bleaching are carried on.

Vieil-Evreux (Mediolanum Aulercorum) was the capital of the Gallic tribe of the Aulerci Elbrovices and a flourishing city during the Gallo-Roman period. It bishopric dates from the 4th century.

The first family of the counts of Evreux which is known was descended from an illegitimate son of Richard I., duke of Normandy, and became extinct in the male line with the death of Count William in 1118. The countship passed in right of Agnes, William's sister, wife of Simon de Montfort-l'Amaury (d. 1087) to the house of the lords of Montfort-l'Amaury. Amaury III. of Montfort ceded it in 1200 to King Philip Augustus. Philip the Fair presented it (1307) to his brother Louis, for whose benefit Philip the Long raised the countship of Evreux into a peerage of France (1317). Philip of Evreux, son of Louis, became king of Navarre by his marriage with Jeanne, daughter of Louis the Headstrong (Hutin), and their son Charles the Bad and their grandson Charles the Noble were also kings of Navarre. The latter ceded his counties of Evreux, Champanog and Brie to King Charles VI. (1404). In 1427 the countship of Evreux was bestowed by King Charles VII. on Sir John Stuart of
Darnley (c. 1365-1420), the commander of his Scottish bodyguard, who in 1423 had received the seigniory of Aubigny and in February 1427/8 was granted the right to quarter the royal arms of France for his victories over the English (see Lady Elizabeth Cust, Account of the Stuarts of Aubigny in France, 1422-1572, 1851). On Stuart's death (before Orleans during an attack on an English convoy), the estates revolted to the crown. It was again temporarily alienated (1569-1584) as an appanage for Francis, duke of Anjou, and in 1651 was finally made over to Frédéric Maurice de la Tour d'Auvergne, duke of Bouillon, in exchange for the principality of Sedan.

**EWALD, GEORG HENRICH AUGUST VON** (1803-1879), German Orientalist and theologian, was born on the 16th of November 1803 at Göttingen, where his father was a linen-weaver. In 1813 he was sent to the gymnasium, and in 1820 he entered the university of his native town, where under J. G. Eichhorn and T. C. Tychsen he devoted himself especially to the study of Oriental languages. At the close of his academic career in 1823 he was appointed to a mastership in the gymnasium at Wolfenbüttel, and made a study of the Oriental manuscripts in the Wolfenbüttel library. But in the spring of 1824 he was recalled to Göttingen as reponent, or theological tutor, and in 1827 (the year of Eichhorn's death) he became professor extra-ordinarius in philosophy and lecturer in Old Testament exegesis. In 1831 he was promoted to the position of professor ordinarius in philosophy; in 1833 he became a member of the Royal Scientific Society, and in 1835, after Tychsen's death, he entered the chair of Hebrew, holding the chair of Oriental languages, and in 1838, and afterwards, in 1841, in theology. To this period belong some of his most important works, and also the commencement of his bitter feud with F. C. Baur and the Tübinger school. In 1847, "the great shipwreck-year in Germany," as he has called it, he was invited back to Göttingen on honourable terms—the liberal constitution having been restored. He gladly accepted the invitation. In 1852-1863 he took an active part in a movement for reform within the Hanoverian Church, and he was a member of the synod which passed the new constitution. He had an important share also in the formation of the Protestant theological university at Halle, the seat of which was transferred to Göttingen in September 1863. But the chief crisis in his life arose out of the political events of 1866. His loyalty to King George (son of Ernst August) would not permit him to take the oath of allegiance to the victorious king of Prussia, and he was therefore placed on the retired list, though with the full amount of his salary as pension. Perhaps even this degree of severity might have been held by the Prussian authorities to be unnecessary, had Ewald been less exasperating in his language. The violent tone of some of his printed manifestoes about this time, especially of his Lob des Königs und des Volkes, led to his being deprived of his professorship (1868) and also to a criminal process, which, however, resulted in his acquittal (May 1869). Then, and on two subsequent occasions, he was returned by the city of Hanover as a member of the North German and German parliaments. In June 1874 he was found guilty of a libel on Prince Bismarck, whom he had compared to Frederick II. in "his unrighteous war with Austria and his ruination of religion and morality," to Napoleon III. in his way of "picking out the best time possible for robbery and plunder." For this offence he was sentenced to undergo three weeks' imprisonment. He died in the early part of the next year of heart disease, the 18th of May 1875.

Ewald was no common man. In his public life he displayed many noble characteristics,—perfect simplicity and sincerity, intense moral earnestness, study independence, absolute fearlessness. As a teacher he had a remarkable power of kindling enthusiasm; and he sent out many distinguished pupils, among whom may be mentioned Hitzig, Schrader, Nöldeke, Diestel and Dillmann. His disciples were not all of one school, but many eminent scholars who apparently have been untouched by his influence have in fact developed some of the many ideas which he suggested. His numerous writings, from 1823 onwards, were the reservoirs in which the entire energy of a life was stored. His Hebrew Grammar inaugurated a new era in biblical philology. All subsequent works in that department have been avowedly based on his, and to him will always belong the honour of having been, as Hitzig has called him, "the second founder of the science of the Hebrew language." As an exegete and biblical critic no less than as a grammarian he has left his abiding mark. His Geschicht des Volkes Israel, the result of thirty years' labour, was epoch-making in that branch of research. While in every line it bears the marks of dividing itself into these genealogical periods, a product highly characteristic of the age, and even of the decade, in which it appeared. If it is obviously the outcome of immense learning on the part of its author, it is no less manifestly the result of the speculations and researches of many laborious predecessors in all departments of history, theology and philosophy. Taking up the idea of a divine education of the human race, which Lessing and Herder had made so familiar to the modern mind, and firmly believing that to each of the leading nations of antiquity a special task had been providentially assigned, Ewald felt no difficulty about Israel's place in universal history, and therefore undertook the study of its ethnology, which he regarded as the key of its religious history, —those of Moses, David and Ezra. The periods are externally indicated by the successive names by which the chosen people were called—Hebrews, Israelites, Jews. The events prior to the exodus are regulated by Ewald to a preliminary chapter of primitive history; and the events of the apostolic and post-apostolic age are treated as a kind of appendix. The entire construction of the history is based, as has already been said, on a critical examination and chronological arrangement of the available documents. So far as the results of criticism are still regarded with respect to the age and authorship of any of them, Ewald's conclusions have shown themselves to be remarkably accurate. But his work remains a storehouse of learning and is increasingly recognized as a work of rare genius.

Of his works the most important are:—Die Composition der Genesis kritisch untersucht (1823), an acute and able attempt to account for the use of the two names of God without recourse to the document-hypothesis; he was not himself, however, permanently convinced by it; De metris carminum Araborum (1829); Das Hoheland Salamons übersetzt u. erklärt (1826; 3rd ed., 1866); Kritische Wurzeln der hebräischen Sprache (1797); Ausführliches Lehrbuch der hebr. Sprache (8th ed., 1870); and it was followed by the Hebr. Sprachlehre für Anfänger (4th ed., 1874); Über einige ältere Divinationen (1831); Leben und Wirken von Methusalem, die Prophet der Apokalypse (1838); Commentarius in Apocalypse Johannis (1838); Abhandlungen zur biblischen u. orientalischen Literatur (1832); Grammatica critica linguae Arabicae (1831-1833); Die poetischen Bücher des alten Bundes (1835-1837; 3rd ed., 1866-1867); Die Propheten des alten Bundes (1840-1841, 2nd ed., 1867-1868); Geschichte des Volkes Israel (1843-1859, 3rd ed., 1864-1868); Geschichte des Volkes Israel in den 2. Hälfte der ersten fünf Jahrhunderte nach Christum (1852-1859); Geschichte des Volkes Israel nach den ersten fünf Jahrhunderten nach Christum (1857); Über das äthiopische Buch Henoch (1842); Die Sendschreiben des Apostels Paulus übersetzt u. erklärt (1852); Die hebräischen Schriften übersetzt u. erklärt (1861-1862); Über das Apostelgeschichte (1861); Geschichte des Propheten Jeremia (1870); Das Sendschreiben an die Hebräer u. Jakobos Rundschreiben (1870); Die Lehre der Bibel von Gott, oder Theologie des alten u. neuen Bundes (1871-1875). The Jahrbücher der biblischen Wissenschaft (1849-1895) were edited, and for the most part written by him. He was the chief promoter of the Zeitschrift für die Kunde des
Ewald, Johannes (1743-1781), the greatest lyric poet of Denmark, was the son of a melancholy and sickly chaplain at Copenhagen, where he was born on the 18th of November 1743. At the age of eleven he was sent to school at Schleswig, his father's birthplace, and returned to the capital only to enter the university in 1758. His father was by that time dead, and in his memory, from fear and foolish remorse he found neither sympathy nor moral support. At fifteen he fell passionately in love with Arene Hulegaard, a girl whose father afterwards married the poet's mother; and the romantic boy resolved on various modes of making himself admired by the young lady. He began to learn Abyssinian, for the purpose of going out as a missionary to Africa, but this scheme was soon given up, and he persuaded a brother, four years older than himself, to run away that they might enlist as hussars in the Prussian army. They managed to reach Hamburg just when the Seven Years' War was commencing and were allowed to enter a regiment. But the elder brother soon got tired and ran away, while the poet, after a series of extraordinary adventures, deserted to the Austrian army, where from being drummer he rose to being sergeant, and was only not made an officer because he was a Protestant. In 1760 he was weary of a soldier's life and deserted again, getting safe back to Denmark. For the next two years he worked with great diligence at the university, but the Arene for whom he had gone through so much hardship and taken so much pains married another man almost immediately after Ewald's final and very successful examination. The disappointment was one from which he never recovered, but his own wretchedness of will was largely to blame for it. He plunged into dissipation of every kind, and gave his serious thoughts only to poetry.

In 1763 his first work, a perfunctory dissertation, De pyrologia sacra, first saw the light. In 1764 he made a considerable success with a short prose story in the popular manner of Snedcor, Lykkens Tempel (The Temple of Fortune), which was translated into German and Icelandic. On the death of Frederick V., however, Ewald first appeared prominently as a poet; he published in 1766 three Elegies over the dead king, which were received with universal acclamation, and of which one, at least, is a very master-piece. But his dramatic poem Adam og Eve (Adam and Eve), by far the finest imaginative work produced in Denmark up to that time, was rejected by the Society of Arts in 1767 and was not published until 1769. At the latter date, however, its merits were perceived. In 1770 Ewald attained success with Philet, a narrative and lyrical poem, and still more with his splendid Rolf Krage, the first original Danish tragedy. For the next ten years Ewald was occupied in producing one brilliant poetical work after another, in rapid succession. In 1771 he published De brutale Klappers (The Brutal Clappers), a tragicomedy, of which all was largely to blame for it. He plunged into the critics and the manager of the Royal Theatre; and in 1772 he translated from the German the lyrical drama of Philomen and Baucis, and brought out his versified comedy of Harlequin Patriot, a satire on the passion for political scribbling created by Stuensens's introduction of the liberty of the press. In 1773 he published Debravende Old (Old Bachelors), a prose comedy. In 1771 he had already collected some of his lyrical poems under the title of Adskilligt of Johannes Ewald (Miscellanies). In 1774 appeared the heroic opera of Balder's Død (Balder's Death), and in 1779 the finest of his works, the lyrical drama Fiskerne (The Fishers), which contains the Danish National Song, "King Christian stood by the high Mast," his most famous lyric.

In the two poems last mentioned, however, Ewald passed beyond contemporary taste, and these great works, the pride of Danish literature, were coldly received. But while the new poetry was slowly winning its way into popular esteem, the poet did not lack admirers, and at the head of these he founded in 1775 the Danish Literary Society, a body which became influential, and which made the study of Ewald a cultus. But the poet's health had broken; when he was writing Rolf Krage he was already an inmate of the consumptive hospital, and when he seemed to be recovering, his health was shattered again by a night spent in the frosty streets. He embittered his existence by the recklessness of his private life, and, finally, through a fall from a horse, he ended by becoming a complete invalid. His last ten years were full of acute suffering; his mother treated him with cruelty, his family with neglect, and but few even of his friends showed any manliness or generosity towards him. In 1774 he was placed in the house of an inspector of fisheries at Rungsted, where Anna Hedevig Jacobsen, the daughter of the house, tended the wasted poet with infinite tenderness and skill. He stayed in this house for three years, and wrote there some of his finest later lyrics. Meanwhile he had fallen deeply in love with the charming solace of his sufferings and won her consent to a marriage. This step, however, was prevented by his family, who roughly removed him to their own keeping near Kronborg. Here he was treated so infamously that he insisted on being taken back to Copenhagen in 1777, where he found an older, but no less tender nurse, in Anne Kristine Skou. Here he wrote Fiskerne fra Krogen (The Fishermen of Kronborg), a poem which became an entertainment of the first importance. Still the health of Ewald was fast ebbing away. In 1780 he was a little better, and managed to be present at the theatre at the first performance of his poem. But this excitement hastened his end, and after months of extreme agony he died on the 17th of March 1781, and was carried to the grave by a large assembly of his admirers, since he was now just recognized by the public for the first time as the greatest national poet. Among his papers were found fragments of three dramas, two on old Scandinavian subjects, entitled Frode and Helge, and the third a tragedy on the story of Crown Prince Frederick, which he meant to treat in a way wholly distinct from Shakespeare's.

Ewald belongs to the race of poetical reformers who appeared in all countries of Europe at the end of the 18th century; but it is interesting to observe that in point of time he preceded all of them. He was born six years earlier than Goethe and Alféri, sixteen years before Schiller, nine years before André Chénier, and twenty-seven years earlier than Wordsworth, but he did for Denmark what each of these poets did for his own country. Ewald found Danish literature given over to tasteless rhetoric, and without art or vigour. He introduced vivacity of style, freshness of imagination and of form, and an imaginative study of nature, which was then unprecedented. But perhaps his greatest claim to notice is the fact that he was the first person to call the attention of the Scandinavian peoples to the treasures of their ancient history and mythology, and to suggest the use of these in imaginative writing. With a colouring more distinctly modern than that of Collins and Gray, his lyrics yet resemble the odes of these his English contemporaries more closely than those of any continental poet; from another point of view his ballads remind us of those of Schiller, which they preceded. His dramas, which had an immense influence on the Danish stage, are not chiefly of anti-English interest, with the exception of "The Fishers," a work that must always live as a great national poem. In personal character and in fate Ewald seems to have been not unlike Heinrich Heine.

The first collected edition of Ewald's works began to appear in his lifetime. It is in four volumes, 1780-1784. His works have constantly been reprinted, but the standard edition is that published in Liebenroth, in 8 vols, 1850-1855. The best biographies of him are those by C. Mollebech (1831), Hammerich (1860) and Andreas Dolleris (1900).
EWART, WILLIAM (1798-1869), English politician, was born in Liverpool on the 1st of May 1798. He was educated at Eton and Christ Church, Oxford, gaining the Newdigate prize for English verse. He was called to the bar at the Middle Temple in 1827, and the next year entered parliament for the borough of Bingley in Yorkshire. He subsequently sat for Liverpool from 1830 to 1837, for Wigton in 1839, and for Dumfriesshire Burghs from 1841 until his retirement from public life in 1868. He died at Broadlea, near Devizes, on the 23rd of January 1869.

Ewart, who was an advanced liberal in politics, was responsible during his long political career for many useful measures. In 1834 he carried a bill for the abolition of hanging in chains, and in 1837 he was successful in getting an act passed for abolishing capital punishment for cattle-stealing and other offences. In 1850 he carried a bill for establishing free libraries supported out of the rates. At that time he was instrumental in getting an act passed for legalizing the use of the metric system of weights and measures. He was always a strong advocate for the abolition of capital punishment, and on his motion in 1864 a select committee was appointed to consider the subject. Other reforms which he advocated and which have since been carried out were an annual statement on education, and the examination of candidates for the civil service and army.

EWE, a group of Negro peoples of the Slave Coast, West Africa. By the natives their country is called Ede-me, "Land of the Ede." The Ewe family forms one linguistic division: the Anlo or Anglawa on the Gold Coast frontier, the Krepì of Anfœu, the Jeji, the Dahomeyans and the Mahi.

See further Dahomey, and A. B. Ellis, The Ede-Speaking Peoples of the Slave Coast . . . (London, 1890).

EWELL, RICHARD STODDERT (1817-1872), American soldier, lieutenant-general in the Confederate army, was born in Georgetown, now a part of Washington, D.C., on the 2nd of February 1817, and graduated at West Point in 1839. As a cavalry officer he saw much active service in the Mexican War and later in Indian warfare in New Mexico. He resigned his commission at the outbreak of the Civil War, and entered the Confederate service. He commanded a brigade in the first Bull Run campaign, and a division in the famous Valley Campaign of "Stone wall" Jackson, to whom he was next in rank. At Cross Keys he was in command of the forces which defeated General Frémont. Ewell's division served with Jackson in the Seven Days and in the campaign of Second Bull Run. At the action of Groveton Ewell lost a leg, but did not on that account retire from active service, though other generals led his men in the sanguinary battles of Antietam (where they lost 47% of their number) and Fredericksburg. After the battle of Fredericksburg he was promoted lieutenant-general and appointed to command the 2nd Corps, with which he had served from the beginning of the Valley Campaign. His promotion set aside General J. E. B. Stuart, the temporary commander of Jackson's corps; that Ewell, crippled as he was, was preferred to the brilliant cavalry leader was a marked testimony to his sterling qualities as a soldier. The invasion of Pennsylvania soon followed, Ewell's corps leading the advance of Lee's army. A federal force was skillfully cut off and destroyed near Winchester, Va., in September. Ewell then marched through the western and southern Pennsylvania unchecked. At the battle of Gettysburg his 2nd Corps decided the fighting of the first day in favour of the Confederates, driving the enemy before them; on the second day it fought a desperate action on Lee's left wing. Ewell took part in the closing operations of 1863 and in all the battles of the Wilderness and Petersburg campaigns. In the final campaign of 1865 he and the remnant of his corps were cut off and forced to surrender at Sailor's Creek, a few days before his chief capitulated to Grant at Appomattox. After the war General Ewell lived in retirement. He died near Spring Hill, Maury County, Tennessee, on the 28th of January 1872.

EWING, ALEXANDER (1814-1873), Scottish divine, was born of an old Highland family in Aberdeen on the 25th of March 1814. In October 1838 he was admitted to deacon's orders, and after his return from Italy he took charge of the episcopal congregation at Forres, and was ordained a presbyter in the autumn of 1841. In 1846 he was elected first bishop of the newly restored diocese of Argyll and the Isles, the duties of which position he discharged till his death on the 22nd of May 1871. In 1851 he received the degree of D.C.L. from the university of Oxford. Though hampered by a delicate bodily constitution, he worked in a spirit of buoyant cheerfulness. By the charm of his personal manner and his catholic sympathies he gradually attained a prominent position. In theological discussion he contended for the exercise of a wide tolerance, and attached little importance to ecclesiastical authority and organization. His own theological position had close affinity with that of Thomas Erskine of Linlathen and Frederick Denison Maurice; but his opinions were the fruit of his own meditation, and were coloured by his own individuality. The trend of his teaching and the compositions gathered by him from his publications—letters to the newspapers, pamphlets, special sermons, essays contributed to the series of Present Day Papers, of which he was the editor, and a volume of sermons entitled Revelation Considered as Light.

EWING, JUlianA HORATIA ORR (1814-1885), English writer of books for children, daughter of the Rev. Alfred Gatty and of Margaret Gatty (q.v.), was born at Ecclesfield, Yorkshire, in 1841. One of a large family, she was accustomed to act as nursery story-teller to her brothers and sisters, and her brother Alfred Scott Gatty provided music to accompany her plays. She was well educated in classics and modern languages, and at an early age began to publish verses, being a contributor to Aunt Judy's Magazine, which her mother started in 1866. The Land of Lost Toys and many other of Julian's stories appeared in this magazine. In 1867 she married Alexander Ewing, himself an author, and the composer of the well-known hymn "Jerusalem the Golden." From this time until her death (31st May 1885), previously to which she had been a constant invalid, Mrs Ewing produced a number of charming children's stories. The best of these are: The Brownies (1870), A Flat-Iron for a Farthing (1873), Lob-ly-ly-by the Fire (1874), The Story of a Short Life (1885) and Jackanapes (1884), the two last-named, in particular, obtaining great success; among others may be mentioned Mrs Over-the-Way's Remembrances (1869), Six to Sixteen, Jan of the Windmill (1876), A Great Emergency (1877), Old London and the Churchwarden (1878), Tales, Brothers, Dally's, Our Garden, A Soldier's Children, Three Little Nest-Birds, A Week Spent in a Glass-House, A Sweet Little Dear, and Blue-Red (1883). Many of these were published by the S.P.C.K. Simple and unadorned in style, and sound and wholesome in matter, with quiet touches of humour and bright sketches of scenery and character, Mrs Ewing's best stories have never been surpassed in the style of literature to which they belong.

EWING, THOMAS (1789-1871), American lawyer and statesman, was born near the village of West Locke, in West Virginia, on the 28th of December 1789. His father, General Ewing, settled in Lancaster, Fairfield county, Ohio, in 1792. Thomas graduated at Ohio University, Athens, Ohio, in 1815, and in August 1816 was admitted to the bar at Lancaster, where he won high rank as an advocate. He was a Whig member of the United States senate in 1831-1837, and as such took a prominent part in the legislative struggle over the United States Bank, whose re-chartering he favoured and which he resolutely defended against President Jackson's attack, opposing in able speeches the withdrawal of deposits and Secretary Woodbury's "Specie Circular" of 1836. In March 1841 he became secretary of the treasury in President W. H. Harrison's cabinet. When, however, after President Tyler's accession, the relations between the President and the Whig Party became strained, he retired (September 1841) and was succeeded by Walter Forward (1786-1852).
Subsequently from March 1849 to July 1850 he was a member of President Taylor's cabinet as the first secretary of the newly established department of the interior. He thoroughly organized the department, and in his able annual report advocated the construction by government aid of a railroad to the Pacific Coast. In 1850-1851 he filled the unexpired term of Thomas Corwin in the U.S. Senate, strenuously opposing Clay's compromise measures and advocating the abolition of slavery in the District of Columbia. He was subsequently a delegate to the Peace Congress in 1861, and was a loyal supporter of President Lincoln's war policy. He died at Lancaster, Ohio, on the 26th of October 1871.

His daughter was the wife of General William T. Sherman. His son, Hugh Boyle Ewing (1836-1905), served throughout the Civil War in the Federal armies, rising from the rank of colonel (1861) to that of brigadier-general (1862) and brevet major-general (1865), and commanding brigades at Antietam and Vicksburg and a division at Chickamauga; and was minister of the United States to the Netherlands in 1866-1870. Another son, Thomas Ewing (1829-1890), studied at Brown University in 1852-1854 (in 1894, by a special vote, he was placed on the list of graduates in the class of 1856); he was a lawyer and a free-state politician in Kansas in 1857-1861, and was the first chief-justice of the Kansas supreme court (1861-1862). In the Civil War he attained the rank of brigadier-general (March 1862) and received the brevet of major-general (1865). He was subsequently a representative in Congress from Ohio in 1877-1881; and from 1882 to 1896 practised law in New York City, where he was long one of the recognized leaders of the bar.

**EXAMINATIONS**

The term "examination" (i.e., inspecting, weighing and testing; from Lat. *examen*, the tongue of a balance) is used in the following article to denote a systematic test of knowledge, and of either special or general capacity or fitness, carried out under the authority of some public body.

1. *History.*—The oldest known system of examinations in history is that used in China for the selection of officers for the public service (c. 1113 B.C.), and the periodic tests which they underwent after entry (c. 2200 B.C.). See China; also W. A. P. Martin, *The Lore of Cathay* (1901), p. 311 et seq.; T. L. Bullock, "Competitive Examinations in China" (*Nineteenth Century*, July 1894) and Étienne Zvi, *Pratique des examens littéraires en Chine* (Shanghai, 1894). The abolition of this system was announced in 1906, and, as a partial substitute, it was decided to hold an annual examination in Peking of Chinese graduates educated abroad (*Times*, 22nd of October 1906).

The majority of examinations in western countries are derived from the university examinations of the middle ages. The first universities of Europe consisted of corporations of teachers and of students analogous to the trade guilds and merchant guilds of the time. In the trade guilds there were apprentices, companions, and masters. No one was admitted to master'ship until he had served his apprenticeship (q.v.), nor, as a rule, until he had shown that he could accomplish a piece of work to the satisfaction of the guild.

The object of the universities was to teach; and to the three classes established by the guild correspond roughly the *scholar*, the *bachelor* or pupil-teacher (see Rashdall i. 209, note 2, and 221, note 5), and the *master* or *doctor* (two terms at first equivalent) who, having served his apprenticeship and passed a definite technical test, had received permission to teach. The early universities of Europe, being under the same religious authority and animated by the same philosophy, resembled each other very closely. They all had similar systems of examinations, and by the authority of the emperor, or of the pope in most cases, the permission to teach granted by one university was valid in all (*jus ubique unum docendi*).

The earliest university examinations of which a description is available are those in civil and in canon law held at Bologna at a period subsequent to 1129. The student was admitted without examination as bachelor after from four to six years' study, and after from six to eight years' study became qualified as a candidate for the doctorate. He might obtain the doctorate in both branches of law in ten years (Rashdall i. 221-222).

The doctoral examination at Bologna in the 13th-14th centuries consisted of two parts—a private examination which was the real test, and a public one of a ceremonial character (*conventus*). The candidate first took an oath that he had complied with all the statutory conditions, that he would give no more than the statutory fees or entertainments to the rector himself, the doctor, or his fellow-students, and that he would obey the rector. He was then presented to the archdeacon of Bologna by one or more doctors, who were required to have satisfied themselves of his fitness by private examination. On the morning of the examination, after attending mass, he was assigned by one of the doctors of the assembled college two passages (*puncta*) in the civil or canon law, which he retired to his house to study, possibly with the assistance of the presenting doctor. Later in the day he gave a lecture on, or exposition of, the prepared passages, and was examined on them by two of the doctors appointed by the college. Other doctors might then put supplementary questions on law arising out of the passages, or might suggest objections to his answers. The vote of the doctors present was taken by ballot, and the fate of the candidate was determined by the majority. The successful candidate, who received the title of licentiate, was, on payment of a heavy fee and other expenses, permitted to proceed to the *conventus* or final public examination. This consisted in the delivery of a speech and the defence of a thesis on some point of law, selected by the candidate, against opponents selected from among the students. The successful candidate received from the archdeacon a formal "licence to teach" by the authority of the pope in the name of the Trinity, and was invested with the insignia of office. At Bologna, though not at Paris, the "permission to teach" soon became fictitious, only a small number of doctors being allowed to exercise the right of teaching in that university (Rashdall).

In the faculty of arts of Paris, towards the end of the 13th century, the system was already more complicated than at Bologna. The baccalaureate, licentiate, and mastership formed three distinct degrees. For admission to the baccalaureate a preliminary test or "Responsorium" was first required, at which the candidate had to dispute in grammar or logic with a master. The examiners then inspected the certificates (*schedulae*) of residence and of having attended lectures in the prescribed subjects, and examined him in the contents of his books. The successful candidate was admitted to maintain a thesis against an opponent, a process called "determination" (see Rashdall i. 443 et seq.), and as bachelor was then permitted to give "cursory" lectures. After five or six years from the date of beginning his studies (matriculation) and being twenty years of age (these conditions varied at different periods), a bachelor was permitted to present himself for the examination for the licentiate-ship, which was divided into two parts. The first part was conducted in private by the chancellor and four examiners (*templores in cameris*), and included an inquiry into the candidate's residence, attendance at lectures, and performance of exercises, as well as examination in prescribed books; those candidates adjudged worthy were admitted to the more important examination before the faculty, and the names of successful candidates were sent to the chancellor in batches of eight or more at a time, arranged in order of merit. (The order of merit at the examination for the licentiate-ship existed in Paris until recently.) Each successful candidate was then required to maintain a thesis chosen by himself (*quodlibet*) in St Julian's church, and was finally submitted to a purely formal public examination (*collatio*) at either the episcopal palace or the abbey of Ste Geneviève, before receiving from the chancellor, in the name of the Trinity, the licence to incept or begin to teach in the faculty of arts. After some six months more the licentiate took part "in a peculiarly solemn disputation known as his "Vespers," then gave his formal inaugural lecture or disputation before the faculty, and was received into the faculty as master. This last process was called "inception."
In discussing the value of medieval examinations of the kind described, Paulsen (The German Universities (1906), p. 25) asserts that they were well adapted to increase a student’s alertness, his power of comprehending new ideas, and his ability quickly and surely to assimilate them to his own, and that “they did more to enable [students] to grasp a subject than the mute and stately reviewing and cramming of our modern examinations can possibly do.” At their best they fulfilled precisely the technical purpose for which they were intended; they fully tested the capacity of the candidate to teach the subjects which he was required to teach in accordance with the methods which he was required to use. The limitations of the test were the limitations of the educational and philosophic ideals of the time, in which a dogmatic basis was presupposed to all knowledge and criticism was limited to the superstructure. At their worst, even with venal examiners (and additional fees were often offered as a bribe), Rashdall regards these examinations (at the end of the 13th century) as probably “less of a farce than the pass examinations of Oxford and Cambridge almost within the memory of persons now living.” It is, however, to be pointed out that the standard in Paris and elsewhere at a later date became scandalously low in some cases. In some universities the sons of nobles were regularly excused certain examinations. At Cambridge in 1774 Fellow Commoners were examined with such precipitation to fulfil the formal requirements of the statutes that the ceremony was termed “huddling for a degree” (Jebb, Remarks upon the Present Mode of Education in the University of Cambridge, 4th ed., 1774, p. 52). The last privileges of this kind were abolished at Cambridge by a grace passed on the 20th of March 1884.

In the medieval examinations described above we find most of the elements of our present examinations: certificates of previous study and good conduct, preparation of set-books, questioning on subjects not specially prepared, division of examinations into various parts, classification in order of merit, payment of fees, the presentation of a dissertation, and the defence and publication of a thesis (a term of which the meaning has now been extended).

The requirement to write answers to questions written or dictated, to satisfy a practical test (other than in teaching), and a clinical test in medicine, appear to be of later date.1 The medieval candidate for the doctorate in medicine, although required to have attended practice before presenting himself, discussed as his thesis a purely theoretical question, often semi-theological in character, of which as an extreme example may be quoted “whether Adam had a navel.”

The competitive system was developed considerably at Louvain, and in the 15th century the candidates for the master’s arts were divided into three classes (rigorosi, honour-men; transibles, pass-men; gratiosi, charity-passes), while a fourth, which was not published, contained the names of those who failed. In the 17th century the first class comprised the names of twelve, and the second, of twenty-four, candidates, who were divided on the report of their teachers into classes before the examination, and finally arranged in order of merit by the examiners (Vernulaeus, quoted by Sir W. Hamilton, Discussions, 1852; p. 647; Rashdall, loc. cit. ii. 262). At the Cambridge tripos (as described by Jebb in 1774, Remarks, &c., pp. 20-31) the first twenty-four candidates were also selected by a preliminary test; they were then divided further into “wranglers” (the disputants, par excellence) and Senior Optimes, the next twelve on the list being called the Junior Optimes. These names have in the mathematics tripos survived the procedure. (The name Tripos is derived from the three-legged stool on which “an old bachelour,” selected for the purpose, sat during his disputation with the senior bachelor of the year, who was required to propound two questions to him.)

1 W. W. Rouse Ball in his History of the Study of Mathematics at Cambridge (1889), p. 193, states that he can find no record of any European examinations by means of written papers earlier than those introduced by R. Bentley at Trinity College, Cambridge, in 1702.

EXAMINATIONS

The subjects in which the medieval universities examined were (i) those of the trivium and quadrivium in the faculty of arts; (ii) theology; (iii) medicine; and (iv) civil and canon law. The number of subjects in which examinations are held has since grown immensely. We can only sketch in outline the transformations of certain typical university systems of examinations.

At Oxford there is no record of a process of formal examination on books similar to that of Paris (Rashdall, ii. 442 et seq.), disputation being apparently the only test applied in its early history. Examinations were definitely introduced for the B.A. and M.A. degrees by Laud in 1636–1638 (Brodrick, History of Oxford, p. 114), but the standard prescribed was so much beyond the actual requirements of later times that it may be doubted if it was enforced. The studies fell in the 18th century into an “abject state,” from which they were first raised by a statute passed in 1700 (Report of Oxford University Commission of 1850–1852, p. 60 et seq.), under which distinctions were first allotted to the ablest candidates for the bachelor’s degree. Further changes were made in 1807 and 1825; and in 1830 a distinction was made between honours examinations of a more difficult character, at which successful candidates were divided into four classes, and pass examinations of an easier character. By the statutes of 1840 and 1858 an intermediate “Modifications” examination was instituted between the preliminary examination called “Responsions” and the final examination. Since 1850, although fresh subjects of examination have been introduced, no considerable change of system has been made.

The bachelor’s degree at Oxford tended from an early period to be postponed to an advanced stage of studies, while the requirements for the master's degree diminished until, in 1807, the examination for the M.A. was abolished. It is now awarded to bachelors of three years’ standing on payment of a fee.

Cambridge in early times followed the example of Oxford, and here also the bachelor’s degree became more and more important (Bass Mullinger, History of the University of Cambridge from 1535 . . . . p. 414), and the M.A. has been finally reduced to a means to a living, standard of terms similar to those of the sister university. The standard of examinations was raised in Cambridge at an earlier date than at Oxford, and in the 18th century the tripos “established the reputation of Cambridge as a School of Mathematical Science.” The school, however, produced few, if any, great mathematicians between Newton and George Green. It was only between 1830 and 1840 that the standard of the tripos became a high one. At Cambridge there is no intermediate examination between the “Previous Examination” (commonly called Little-go”), which corresponds to Oxford “Responsions” or “Smalls” and the triposes and examinations for the “First” degree; an examination for the Oxford final honours and pass examinations respectively. But most of the triposes have been divided into two parts, of which the second is not obligatory in order to obtain a degree. The “senior wrangler” was the first candidate in order of merit in the first part of the mathematical triposes. The abolition of order of merit at this examination was decided on in 1906, and names of candidates appeared in this order for the last time in 1909.

At the Scottish universities the B.A. degree has become extinct, and the M.A., awarded on the results of examination, is the first degree in the faculty of arts. The incorporation of the university of London in 1836 marks an era in the history of examinations; the teaching and examining functions of a university were dissociated for the first time. Until 1858 the London examinations were open only to students in affiliated colleges, and the teachers had no share in the appointment of the examiners or in determining the curricula for examinations; in 1858 the examinations were thrown open to all comers, and no requirements were insisted on with regard to courses of study except for degrees in the faculty of medicine. The sole function of the university was to examine, and its examinations for matriculation and degrees in all subjects were carried out by means of written papers not only in London but in many centres in the United Kingdom and the colonies. From the
first the degrees were (unlike those of Oxford and Cambridge until 1871) open to all male persons without religious distinctions; and in 1875 they were opened to women. (Tripus examinations were thrown open to women at Cambridge by the grace of 24th Feb. 1883, and at Oxford women were admitted to examinations for honours by statute of 29th April 1884. Proposals to admit women to university degrees were rejected by Oxford and Cambridge in 1896 and 1897 respectively.)

The standard of difficulty set by the university of London was a high one, very much higher for its pass degrees than the corresponding standards at Oxford and Cambridge, while the standard for honours was equally high. In medicine the examinations were made both wider in range and more searching than those of any other examining body. But, for reasons dealt with in detail elsewhere, the examination is not what it was by the new system. In 1880 the Victoria University, Manchester, was established, in which teaching and examining were again united; and in the universities since established, with the exception of the Royal University of Ireland (which was created in 1850 as an examining body on the model of London, but which was dissolved under the Irish Universities Act 1908, and replaced by the National University of Ireland and the Queen's University of Belfast), the precedent of Victoria has been followed. By an act passed in 1868, of which the provisions came into force in 1906, the university of London was reconstituted as a teaching university, although provision was made for the continuance of the system of examinations by "external examiners" for "external students," together with "internal examinations" for "internal students," in which the teachers and the external examiners of the university are associated. The examinations in music and the final examinations in law and medicine are carried on [1910] both for "internal" and "external" students by "external" examiners only, who are, however, appointed on the recommendation of boards of studies consisting mainly of London teachers.

At the university of Dublin, examinations have been maintained both for the B.A. and M.A. degrees, and students may be admitted to the examinations in subjects other than divinity, law, medicine, and engineering without attendance at university courses.

The examinations of the newer universities, the Victoria University of Manchester, Birmingham, Liverpool, Leeds, Sheffield and Wales, are open only to students at these universities, and are conducted by the teachers in association with one or more external examiners for each subject. In some universities, e.g. Manchester, the M.A. degree is given after examination to students who have taken a pass, and without examination to those who have taken an honours degree.

The universities which have departed furthest from the medieval system of examinations, at any rate in appearance, are those of Germany. The baccalaureate has disappeared, but students cannot be matriculated without having passed the Abiturienten-examen (see below), probably the most severe of all entrance examinations (foreign students may be exempted under certain conditions). The student desiring to proceed to the doctorate is free from examinations thereafter until he presents his thesis for the doctor's degree, when, if it is accepted, he is submitted to a public oral examination not only in his particular subject (Hauptfach) but in two other subjects (Nebenfächer). The doctor's degree does not give the right to teach in a faculty (senia legenda). To acquire this, a doctor must present a further thesis (Habilitationsschrift), and must deliver two lectures, one before the faculty, followed by a discussion (colloquium), the other in public; but these lectures "seem to be merely secondary and are tending to become so more and more"; "scientific productiveness is so sharply emphasized among the conditions for admission that it overshadows all the rest" (Paulsen, loc. cit. p. 165).

It should be mentioned that the professors of chemistry of a number of German, Austrian and Swiss universities, have, by agreement, instituted an intermediate examination in that subject which students are required to pass before beginning work on the doctoral thesis. The examination of the students is conducted by the teachers concerned.

In France the examination for the baccalaureate, though conducted in part by university examiners, has become a school-leaving examination (see below). The licentiatehip has been preserved in the faculties of arts, science and laws, and is in point of difficulty about equal to the pass degree examinations of the universities of London, though differing in the nature of the tests. In the faculty of sciences, the three subjects of examination selected may, under a recent regulation, be taken separately. Until a few years ago the successful candidates at the licentiatehip were arranged in order of merit. For the doctorate in the faculty of letters two theses must be submitted, of which the subject and plan must be approved by the faculty (until recently one of them was required to be written in Latin). Permission to print the theses is given by the rector or vice-rector after regulation of the work and they are then discussed publicly by the faculty and the candidate {soutenance de these}.

In this public discussion the "disputation" of the middle ages survives in its least changed form. The literary theses required by French universities are, as a rule, volumes of several hundred pages, and more important in character even than the German Habilitationsschrift. The possession of the doctorate is a sine qua non for eligibility to a university chair, and to a lectureship in the university of Paris.

In the faculty of sciences a candidate for the doctorate may submit two theses, or else submit one thesis and undergo an oral examination.

In the doctorate in law, a thesis and two oral examinations are required.

In the faculty of medicine there is no licentiatehip, but for the doctorate six examinations must be passed and a thesis submitted.

There is also a special doctorate, the "doctorat d'Université," awarded on a thesis and an oral examination; and there are diplomas (Diplômes d'Études supérieures) awarded on dissertations and examinations on subjects in philosophy, history and geography, classics or modern languages, selected mainly by the candidate, and approved by the faculty.

2. Professional Examinations. (a) Teaching.—University examinations for degrees having ceased to be used as technical tests of teaching capacity, new examinations have been devised for this purpose. The test for German university teachers has been described above. For secondary teachers, W. von Humboldt instituted a special examination in 1810 (Paulsen, Gesch. des gelehrt. Unterrichts, li. pp. 283 and 393), and an examination for primary teachers was instituted in Prussia in 1794.

In France there is a competitive examination for secondary teachers (agrégation), originally established in 1766. Agrégats have a right to state employment and they alone can occupy the highest teaching post (chaire de professeur) in a state secondary school, other posts being open to licentiates. There are also examinations for primary teachers. The tests for teachers are different for the two sexes.

In England there is no obligatory test for secondary teachers. The universities and the College of Preceptors conduct examinations for teaching diplomas. The Board of Education holds special examinations (Preliminary Certificate examination and Certificate examination, &c.) for primary teachers.

(b) Medicine.—This rule holds for Medicine.

(c) Other Professions.—A system of professional examinations carried on by professional bodies, in some cases with legal sanction, was developed in England during the 19th century. Those in the following subjects are the most important: Accountancy (Institute of Chartered Accountants and Society of Accountants and Auditors), actuarial work (Institute of Actuaries), music (Royal Academy of Music, Royal College of Music, Trinity College of Music, Royal College of Organists, and the Incorporated Society of Musicians), pharmacy (Pharmaceutical Society), plumbing (the Plumbers' Company), surveying (Surveysors' Institution), veterinary medicine (Royal College of Veterinary Surgeons), technical subjects, e.g. cotton-spinning, dyeing, motor-manufacture (City & Guilds of London Institute), architecture (Royal Institute of British Architects), commercial
EXAMINATIONS

subjects, shorthand (the Society of Arts and London Chamber of Commerce), engineering (Institutions of Civil Engineers, of Mechanical Engineers, and of Electrical Engineers).

3. School-leaving Examinations.—The faculty of arts in medieval universities covered secondary as well as higher education in the subjects concerned. The division in arts subjects between secondary and university education has been drawn at different levels in different countries. Thus the first two years of the arts curriculum in English and American universities correspond, roughly speaking, to the last two years spent in a secondary school of Germany or France, and the continental "school-leaving examinations" correspond to the school-leaving examinations in England. These examinations form the basis of the pass examinations for the degree at Oxford and Cambridge (Mark Pattison, Suggestions on Academical Organisation, 1868, p. 238, and Matthew Arnold, Higher Schools and Universities in Germany, 1892, p. 209).

A tabular summary is given (see Tables I., II., III., IV.) of the requirements of the secondary school-leaving examinations of France, Prussia (for the nine-year secondary schools) and Scotland, and of the university of London.

There are in England a number of school-leaving examinations which, though primarily for schools, also serve as school-leaving examinations, and give entrance to certain universities, especially the Oxford and Cambridge local examinations (both established in 1858), and the examinations of the Oxford and Cambridge "Joint Board." A movement to reduce the number of entrance examinations and to secure uniformity in their standard was set on foot in 1901. In that year the General Medical Council communicated to the Board of Education a memorial on the subject from the Headmasters' Conference. The memorial was further communicated to various professional bodies concerned. Conferences were held by the consultative committee of the Board of Education in 1903, with representatives of the universities, the headmasters' conference, the Association of Head-Masters, the Association of Head-Mistresses, the College of Preceptors, the Private Schools' Association, and with representatives of professional bodies. The committee were of opinion that a central board, consisting of representatives of the Board of Education and the different examining bodies, should be established, to co-ordinate and control the standards of [the examinations, and to secure interchangeability of certificates, &c., as soon as a sufficient number of such bodies signified their willingness to be represented on the board. They recommended that the examination should be conducted by external and internal examiners, representing in each case the examining body and the school staff respectively, and that reports on the school work of candidates should be available for reference by the examiners (circular of the Board of Education of 31st of July 1904).

The "accrediting" system in the United States was started by the university of Michigan in 1871. A school desiring to be accredited is submitted to inspection without previous notice. If the inspection is satisfactory, the school is accredited by a university for from one to three years, and upon the favourable report of its principal any of its students are admitted to the university by which it has been accredited without any entrance examination. In practice it is found that many students whom their teachers refuse to certify are able to pass the university entrance examination. The statistics of nine years show that the standard of the certified students is higher than that of non-certified students. Two hundred and fifty schools are accredited by the university of Michigan. In 1904 it was stated that the system was gaining favour in the east, and that it had been adopted on a large scale by all the eastern colleges and universities with the exception of Harvard, Yale, Princeton and Columbia.

4. Methods of Examination.—Examinations may test (i.) knowledge, or, more exactly, the power of restating facts and arguments of a kind that may be learnt by rote; (ii.) the power of doing something, e.g. of making a précis of a written document, of writing a letter or a report on a particular subject with a particular object in view, of translating from or into a foreign language, of solving a mathematical problem, of criticizing a passage from a literary work, of writing an essay on an historical or literary subject with the aid of books in a library, of diagnosing the malady of a patient, of analysing a chemical mixture or compound; and (the highest form under the rubric) of making an original contribution to learning or science as the result of personal investigation or experiment. Examinations are carried out by means of (i.) written papers; (ii.) oral examinations; (iii.) practical, including in medicine clinical, tests; (iv.) theoretical examinations, using some method of interpreting the results.

In written examinations the candidates are, as a rule, supplied with a number of printed questions, of which they must answer all, or a certain proportion, within a given time, varying, as a rule, from 1½ to 3 hours, the latter being the duration most generally adopted for higher examinations in England. Whereas in France and Germany the questions are generally few in number and require long answers, showing constructive skill and mastery of the mother-tongue on the part of the candidates, such "essay-papers" are comparatively rare or of a different kind. In many cases, the voice, the argument, the memory rather than capacity. It has been suggested that sets of questions to be answered in writing should as a rule be divided into two parts: (i.) a number of questions requiring short answers and intended to test the range of the candidate's knowledge; (ii.) questions requiring long answers, intended to test its depth, and the candidate's powers of co-ordination and reflection. A necessary condition for the application of the second kind of test is that time should be given for reflection and for rewriting, say one-third or one-quarter of the whole time allowed. A further distinction is important, especially in such subjects as mathematics or foreign languages, in which it is legitimate to ask what precise power on the part of a candidate the passing of an examination shall signify. Owing to a prevailing confusion between tests of memory and tests of capacity, the allowance for chance fairly applied to the former is apt to be unduly extended to the latter. In applying tests of memory, it may be legitimate to allow a candidate to pass who answers correctly from 30 to 50% of the questions; such an allowance if applied to a test of capacity, such as the performance of a sum in addition, the solution of triangles by means of trigonometrical tables, or the translation of an extract from a foreign language, appears to be irrational. A candidate who obtains only 50% of the marks in performing such operations cannot be regarded as being able to perform them; and, if the examination is to be treated as a test of his capacity to perform them, he should be rejected unless he obtains full marks, less a certain allowance (say 10, or at most 20%) in view of the more or less artificial conditions inherent in all examinations.

The oral examination is better suited than the written to discover the range of a candidate's knowledge; it also serves further test of his powers of expression in his mother tongue, or in a foreign language, and may be used (as in the examination for entrance to the Osborne Naval College) to test the important qualities (hardly tested in any other examinations at present), readiness of wit, common-sense and nerve. It may be objected that candidates are heavily handicapped by nervousness in oral examinations, but this objection does not afford sufficient ground for rejecting the test, provided that it is supplemented by others. Oral tests are used almost invariably in medical examinations; and there is a growing tendency to make them compulsory in dealing with modern languages. Oral examinations are much more used abroad than in England, where the pupils during their school years receive but little exercise in the art of consecutive speaking.

The laboratory examination may be used in subjects like physics, chemistry, geology, zoology, botany, anatomy, physiology, to test powers of manipulation and knowledge of experimental methods. In some cases (e.g. in certain honours

<tr>
<td>Abituarienten Examens (established in 1888).</td>
<td>Age only limited by condition of length of school course. The usual age is 17-18.</td>
<td>9 years. Candidates who have not attended the 9 years' school course may be admitted to the examination on special application.</td>
<td>In Gymnasium: German essay. Mathematics. Translation into Latin. Translation from Greek into German. Latin. Greek. English or French. Religion. History. Mathematics. In Real-Gymnasium: German essay. Mathematics. Translation from Latin. Translation from German into, or essay in, English or French. Physics. Latin. English. French. Physics or Chemistry. Religion. History. Mathematics. In Ober-Realschule: German essay. Mathematics. An exercise in French and in English (an essay in one language and a translation from the other into German). Physics or Chemistry. English. French. Physics. Chemistry. Religion. History. Mathematics.</td>
<td>The object of the examination is defined as being a test of whether the candidate has fulfilled the aims laid down in the curricula, i.e., prescribed for a Gymnasium, Gymnasium or Ober-realschule, as the case may be, and the subjects of examination are those prescribed in the curricula for the kind of school concerned. The report on the school work of each candidate in his various subjects is laid before the Examining Board before the beginning of the examination.</td>
<td>The Examining Board consists of a government inspector (der Königliche Kommissar) acting as chairman, the headmaster of the school, and the teachers of the highest classes in the school. The Inspector may nominate a deputy, who, if a rule, the headmaster of the school. Each teacher concerned selects for the written examination three alternative subjects in his branch, from which, after receiving a report thereon from the headmaster, the inspector makes a final choice. The papers are marked by the teachers concerned, and circulated to the whole Board of Examiners, who then decide whether individual candidates shall be (i) rejected, (ii) admitted with exemption from the oral examination, or (iii) submitted to the oral examination.</td>
<td>The written examination extends over four or five days. Only one paper is given each day, for which 2 to 3 hours are allowed (5½ hours for the German essay). For essays in foreign languages dictionaries may be used.</td>

<td>Baccalauréat de l'enseignement secondaire.</td>
<td>This examination has been carried on under different forms since 1868. The regulations summarized here date from 1899, when the baccalauréat described replaced the baccalauréat-double, baccalauréat-ès-sciences and baccalauréat de l'enseignement moderne.</td>
<td>There is no requirement of attendance. Part I of the examination corresponds exactly to the subjects taken in the &quot;second cycle&quot; of secondary education, and Part II to the classe de philosophie and classe de mathématiques. See also under V.</td>
<td>Part I is divided into four Branches, viz.: (i) Latin-Greek. (ii) Latin-modern languages. (iii) Latin-science. (iv) Science-modern languages. In each Branch the examination is divided into two parts, viz. written and oral. The nature of the examination may be indicated by the following requirements in Branch (i): (i) French composition. (ii) Translation from Latin. (iii) Translation from Greek. (iv) Explanation of a Greek text. (v) Explanation of a Latin text. (vi) Explanation of a French text. (vii) Test in a modern foreign language. (viii) Interrogation on ancient history. (ix) Interrogation on modern history. (x) Interrogation on geography. (xi) Interrogation on mathematics. (xii) Interrogation on physics. Part II is divided into two Branches, viz.: (1) Philosophy. (2) Mathematics. The nature of the examination may be indicated by the following requirements in Branch (ii): (i) An essay in French on a philosophical subject. (ii) An examination in physical and natural science. (iii) Interrogation on philosophy and philosophical writers. (iv) Interrogation on contemporary history. (v) Interrogation on physical science. (vi) Interrogation on natural science.</td>
<td>The syllabus of the examination is prescribed for the higher secondary schools. The candidate may submit his Brevet scolaire, or school record, which will be taken into account.</td>
<td>The Board of Examiners (or &quot;jury&quot;) consists of (i) University Callidnors being members of a faculty of letters or faculty of sciences; (ii) Secondary school teachers, retired or reformed, selected by the minister of public instruction. The Board consists of from four to six examiners, of whom, when the number is even, half are chosen from either category.</td>
<td>The written portion of Part I. extends over all (not on a single day), in periods of 3 or 4 hours each; the written portion of Part II. extends over from 6 to 9 hours. The oral examination for each part lasts 1 hour on the average, and is public.</td>

<td>Scottish school-leaving examination (established 1888). See example on the &quot;Leaving Certificate Examination&quot; issued by the Scottish Education Department, 1906.)</td>
<td>15 on 1st of January following the year in which the candidate passes the last of the written examinations.</td>
<td>4 years.</td>
<td>Candidates must pass in four subjects on the higher grade standard, or in three subjects on the higher grade standard and two on the lower. A pass in drawing is accepted in lieu of one of the two lower grade papers. A pass in French is reckoned as a pass on the lower grade. All candidates must have passed in higher English and in either higher or lower grade mathematics. The remaining subjects may be either science with one or more languages (Latin, Greek, French, German, Spanish, or Italian), or languages only. But where two or more languages other than English are taken, the candidate's group must include either higher or lower grade Latin. A pass in Spanish, Italian, or science (in which subjects there is only one examination) is reckoned as a pass on the higher grade standard.</td>
<td>Schools are inspected and the course of instruction must be approved by the Scottish Education Department; but the examinations are conducted by external examiners whom teachers are not associated.</td>
<td>The examiners are appointed by the Scottish Education Department.</td>
<td>The examination consists of a written examination and an oral examination, on which stress is laid. The length of the examination varies from 7 to 9½ hours. If the candidate selects on the higher grade, English, Latin, mathematics, and French, the examination extends over 10½ hours.</td>

<tr>
<td>School examination, matriculation standard (established in 1902). Note—A higher school-leaving certificate is awarded to pupils who have pursued an approved course of study for a period of at least 4 terms at a school or schools under inspection approved by the University; and (ii) being matriculated students, have passed the &quot;higher school examination&quot; in at least three subjects at one and the same examination.</td>
<td>The minimum age of entry is 14, but the candidate is under 16 or must remain at school until he is 16 years of age in order to be qualified for the school-leaving certificate and cannot be registered as a student of the University until he has reached that age.</td>
<td>The curriculum of each school is considered on its own merits.</td>
<td>Pupils must satisfy the examiners in not less than five subjects, as follows: (a) English, (b) elementary mathematics, (c) Latin, or elementary mechanics, or elementary physics—heat, light, and sound, or elementary chemistry, or elementary botany, or general elementary science. (a) and (b) Two of the following subjects, neither of which has already been taken under section (a). If Latin be not taken, one of the other subjects selected must be another language, either ancient or modern, from the list, and languages other than those included in the list may be taken if approved by the University, provided that the language is included in the regular curriculum:—Latin, Greek, French, German, ancient history, modern history, history and geography, physical and general geography, logic, geometrical and mechanical drawing, mathematics (more advanced), elementary mechanics, elementary chemistry, elementary physics—heat, light, and sound, elementary physics—electricity and magnetism, elementary biology—botany, elementary biology—zoology, general elementary science (chemistry and physics).</td>
<td>Schools under approved inspection, and course of instruction approved by the University. The papers are ordinarily set on the matriculation syllabus, but papers may be specially set more closely in accordance with the school curriculum provided that the syllabus proposed is approved by the University at least equivalent to that for which it is substituted.</td>
<td>The examiners are ordinarily appointed by the University for the ordinary matriculation examination.</td>
<td>The examination extends over at least 18 hours, and includes an oral examination in modern languages.</td>
</tr>
</tbody>
</table>

examinations) the examination may be prolonged over one or more days, and may test higher powers of investigation. But such powers can only be fully tested by the performance of original work, under conditions difficult to fulfill in the examination room or laboratory. At the French examinations for the prix de Rome the candidates are required to execute a painting in a given number of days, under strict supervision (en logos). In medicine the clinical examination of a patient is a test carried out under conditions more nearly approaching those of actual work than any other; and distinction in medical examinations is probably more often followed by distinction in after life than is the case in other examinations.

For the doctor's degree (where this is not an honorary distinction) a thesis or dissertation is generally, though not invariably, required in England. Of recent years the thesis has been introduced into lower examinations; it is required for the master's degree at London in the case of internal students, in subjects other than mathematics (1910); both at Oxford and London, the B.Sc. degree, and at Cambridge the B.A. degree, may be given for research, although the number of students proceeding to a degree in this way is at present relatively small. In certain of the honours B.A. and B.Sc. examinations at Manchester and Liverpool, candidates may take the written portion of the examination at the end of the second year's course of study and submit a dissertation at the end of the third year. Theses are generally examined by two or more specialists.

5. Competitive Examinations.—The arrangement of students in order of merit led naturally to the use of examinations not only as a qualifying but also as a selective test, and to the offering of money prizes (including exhibitions, scholarships and fellowships) on the results. In 1854 selection by examination as a method of appointment to posts in the English public service was first substituted for the patronage system, which had caused grave dissatisfaction (see Macaulay's speech on the subject, The Times of the 25th of June 1855). The first public competitive examination for the Royal Military Academy, Woolwich, took place in
1855, and in 1870 the principle of open competition for the civil service was adopted as a general rule. (For further details see Civil Service.)

In the Württemberg civil service candidates are admitted to a year's probation after passing a theoretical examination, at the conclusion of which they must pass an examination of a more practical character. (A. Herbert, Sacrifice of Education . . . , 1889, p. 111.) In the award of scholarships, &c., it should be definitely decided whether the scholarship is to be awarded (1) for attainment, in which case the examination-test pure and simple may suffice, or (2) for promise, in which case personal information and a curriculum vitae are necessary. To take a simple instance: a candidate partly educated in Germany may or may not be a more meritorious candidate than another who is more gifted, but whose opportunities have been less; the question at once arises, are the examiners to take the circumstances of the candidate into account or not? It is understood that at the colleges of the older universities such circumstances are considered. It must again be decided whether the financial circumstances of candidates are to be taken into account; are scholarships intended as prizes, or as a means of enabling poor students to obtain a university education? In some cases wealthy students have been known to return the emoluments of scholarships. It many universities of the United States there is a definite understanding that emoluments shall only be accepted by those needing them. It would not be difficult to ask candidates to make a confidential declaration on this subject on entrance and to establish in Great Britain a tradition similar to that of the United States, and steps in this direction have been taken both at Oxford and Cambridge (Lord Curzon of Kedleston, University Reform, p. 86).

A special allowance may be made for age. In certain scholarship examinations held formerly by the London County Council a percentage was added to the marks of each candidate proportionate to the number of months by which his age fell short of the maximum age for entry. The whole subject of entrance scholarships at English schools and universities, and especially their tendency to produce premature specialization, has recently been much discussed.

6. The Organization and Conduct of Examinations.—The organization and conduct of examinations, in such a way that each candidate shall be treated in precisely the same way as every other candidate, is a complex matter, especially where several thousand candidates are concerned. The greatest precautions must be taken to ensure the secrecy of the examination papers before the examination, and the effective isolation of individual candidates during the examination. The supervision should be adequate to remove all temptation to copying. The hygienic conditions should be such as to reduce the strain to a minimum. The question of the mental fatigue produced by examinations has been studied by certain German observers, but has not yet been fully investigated.

7. Marking, Classification and Errors of Detail.—In applying a single test in a qualifying examination it would be sufficient to mark candidates as passing or failing. But examinations consist of a large number of tests, and the score obtained in respect of each test or portion of a test in order to enable the examining body to estimate the performance, considered as a whole, of the candidate. At Oxford the marks are not numerical, but the papers are judged as of this or that supposed "class," and various degrees of merit are indicated by the symbols α, β, γ, δ, to which the signs + or − may be prefixed, according as they are above or below a certain standard within each class. At Cambridge, numerical marks are used. The advantage of numerical marks is that they are more easily manipulated than symbols; the disadvantage, that they produce the false impression that merit can be estimated with mathematical accuracy. Professor F. Y. Edgeworth, in two papers on "The Statistics of Examinations" and the "Element of Chance in Competitive Examinations" (Journal of the Royal Statistical Society, 1888 and 1890), has dealt with the subject, although on somewhat limited lines. His investigations show clearly that with candidates near the border-line of failure, which must necessarily be fixed at a given point (subject to certain allowances, where more than one subject is considered), the element of chance necessarily enters largely into the question of pass and failure. The fact may be stated in this way:—the general efficiency of the test being granted, it is true to say that the large majority of those who pass an examination will be superior in efficiency to those who fail; but a few of those who fail may be superior to a few of those who pass. These errors are not peculiar to the examination system, they are inherent in all human judgments. It is necessary to allow for them in considering the failure of an individual candidate as an index of inferiority.

The element of chance, which prevails in the region on either side of the border between pass and failure, obviously prevails equally on either side of the border between "classes," where candidates are classified; it has been suggested by Dr Schuster that numerical order should accompany classification so as to avoid the creation of an artificial gap between the last candidate in one class and the highest in the next. Edgeworth's objection to such an argument is that the number of uncertainties is far less when candidates are classified than when they are placed in onestable order of merit.

The difficulties of comparison of marks are further complicated when students take different subjects and it is necessary to compare their merit by means of marks allotted by different examiners and added together. In a pass examination the question has to be considered how far, if at all, excellence in one subject shall compensate for deficiency in another, a question which is indeterminate until the precise object of the whole examination is formulated. In the competitive examination for the Indian civil service, places are allotted on the aggregate of marks obtained in a number of subjects selected by the candidate from a list of thirty-two. The successful candidates are compared a year later on the results of another examination in which there is again a choice, though a much more limited one. The order of merit in the two examinations is, as a rule, very different. Two further points may be noted. An examiner may have underestimated the time required to answer the questions which he has set; this will be obvious if with a large number of candidates (say 300 or 400) none approaches the maximum mark. In this case the maximum should be reduced. Again, it is generally recognized to be undesirable to give marks for a smattering. In order to avoid this various devices are adopted. The simplest is to award a proportion of marks (say 10 to 15, even 20%) for "general impression." It is also usual, unless say 20% or more marks are obtained for a particular subject, to have no credit given for the paper in that subject.

Latham (The Action of Examinations, 1877, p. 490) describes other numerical adjustments used to meet this difficulty, especially that used in English civil service examinations. The numerical results of the civil service examinations are reduced so as to conform to a certain symmetrical "frequency-curve," of which the absissa represent percentages of marks between definite limits and the ordinates the number of candidates obtaining the required mark. In the case of "classes," a line is drawn between those obtained in each class, and a line showing the frequency of "marks" (say 20%) for "general impression." The curve for "classes" is of course lower and flatter than that for the individual examination, and the number of "non-workers" and "workers." In pass examinations of a well-known character there is a maximum just beyond the pass mark, this being the point of efficiency at which many students aim.

8. The Object and Efficiency of Examinations, and their Indirect Effects.—In order to estimate the efficiency of an examination as a test, the precise question should be asked in each examination, what is it intended to test? Much of the evil attributed to examinations is due to the fact that this question has not been definitely put, and that a test legitimate for certain purposes has been used for others to which it is unsuited. Examinations are suited in the first instance for the
EXAMINATIONS

purpose for which they were originally designed in medieval universities—the test of technical and professional capacity; it has never been proposed to abolish qualifying examinations for doctors, pharmaceutical chemists, &c.; the tests applied are (or should be) designed to test the knowledge and capacity carried out under conditions as nearly as possible like those of actual practice. If a student can auscultate correctly, or make up a prescription, at an examination, he will in all probability be able to do so in other circumstances.

Examinations as tests of the knowledge of isolated facts are necessarily of relatively small value, because the memory of such facts is transient; and memorization of a large number of facts for examination purposes is generally admitted to be specially transient; the "knowledge-test," considered apart from a test of capacity, is in fact not a test of permanent knowledge, but of the speed of retaining facts for a large period of time, which is impossible to estimate and which with some candidates extends over a few weeks only. When used as tests of "general culture," examinations, in the view of Paulsen, based on a study of German education, not only fail in their purpose, but tend to destroy the faculties which it is desired to develop (Geschichte des gelehrten Unterrichts, ii. 684 et seq.); to prepare ready answers to the numberless questions which an examiner may ask on a large variety of subjects is to paralyse the natural and free activity of the mind (cf. A. C. Benson on the results of English secondary classical education, Press of Coll. Wick, Oxford 1852, p. 135-177). If pushed to its logical conclusion the view of Paulsen must, it is submitted, lead to the complete abandonment at examinations of tests of "knowledge" as distinguished from direct tests of capacity. Thus isolated questions on details of grammar would disappear from papers on the mother-tongue and on foreign languages, in which the test would consist mainly or entirely of composition and translation. Erudition would be tested by the power of writing, at leisure, a dissertation on some subject selected by the examiners or the candidate or, in the case of a teacher, by the delivery of a lecture on the subject. At the French agrégation candidates are given twenty-four hours for the preparation of a lecture of this kind. Such examinations would test the "skill in the manipulation of facts which is the true sign of a trained intelligence" (cf. K. Pearson, "The Function of Science in the Modern State," Uncy. Brit. roth ed. xxi. Prefatory essay). They might possibly be supplemented by easy oral examinations to test both range of knowledge and readiness of mind. But in the case of a pupil who had passed through a good secondary school it would be as safe to rely for supplementary information under this head on the testimony of his school teachers as it is to rely on his evidence with regard to the fundamental and all-important element on which no examination supplies direct information—personal character.

The main arguments of those opposed to the examination system may be summarized as follows: (i.) Examinations tend to destroy natural interests and exclude from the attention of the pupil all matters outside the purview of the examination (they would not do so if examinations were so limited in character that preparation therefor could absorb only a fraction of the pupil's time); (ii.) they tend to cultivate a personal judgment which is not a sound basis of judgment is possible, (this argument, directed mainly against the Oxford examinations, is given by twenty-four examinations in general, but to the character of the subjects set for essays); (iii.) competitive examinations on the home and Indian civil services scheme tend to diffuse mental energy over too many subjects (but see (xiv.) below); (iv.) examinations, especially competitive examinations, tend to become more and more difficult, difficulty being confused with efficiency—this has shown itself with the Cambridge mathematical tripos, in which for years questions of increasing difficulty were set on relatively unimportant subjects, until the examination was reformed (reply: all examinations should be overhauled periodically); (v.) they tend to paralyse the powers of exposition, all statements of knowledge being thrown into a form suitable, not for an uninstructed person, but for one who already possesses it, the examiner (this tendency should be counteracted by definite training in composition); (vi.) the sample of knowledge and capacity yielded at an examination is frequently not a fair sample; it is liable to extreme variations in a favourable sense, if the candidate happens to have prepared the precise questions asked; in an unfavourable sense, if the candidate is suffering from misfortune or from accidental ill-health, the latter, owing to the periodic function, occurring much more frequently in the case of women than of men—the reform of examination methods may remove to a great extent the element of chance in questions set; in a competitive examination it is impossible to allow for ill-health; in a qualifying examination it is difficult to make any allowance unless the examination is definitely conducted in whole or in part by the teachers, and the past record of the candidate is taken into account (cf. Paulsen, The German Examinations under the Old Law, pp. 344-345); (vii.) examinations of several hundred candidates the passed are, the number of hours examination, it is proposed so as to be equally fair to the individuality of all candidates; the individual test is the only complete one (it is admitted that examinations on a large scale necessarily involve a margin of error; but this error may be reduced to a minimum, especially by a combination of oral and practical with written work); (viii.) the multiplicity of school examinations required for different reasons produces confusion in our secondary education (there is a growing tendency to admit equivalence of "school-leaving" and entrance examinations; thus entrance examinations of Oxford, Cambridge, and the Northern Universities Joint Board are interchangeable under certain conditions); (ix.) the multiplicity of examinations tends to "underselling" (the success of the London examinations in medicine proves that a high standard attracts candidates as well as a low one; possibly intermediate standards may be killed in the competition; it is by no means obvious that a uniform system of examinations would conduct to efficiency); (x.) examinations produce physical damage to health, especially in the case of women-students (on this point more statistical evidence is needed; see, however, Engelmann quoted by G. Stanley Hall, Adolescence, pp. 588 et seq.); (xi.) examinations have in England mechanically cast the education of women into the same mould as that of men, without reference to the different social functions of the two sexes (the remedy is obvious); (xii.) it is unjustifiable to give a man a university position on the results of his performance in the examination room, a practice common in England though almost unknown on the continent; a just estimate of a man's powers in research or for teaching can only be properly based on his performance. The present system merely leads to the transmission of the sterile art of passing examinations, Oxford, Cambridge and Cambridge fellowships are now awarded on the results of examinations; it is sometimes stated, in defence of this system, that young men cannot be expected to carry out research in classics or philosophy.)

On the other hand, the defenders of examinations reply that (xiii.) examinations are necessary in order to test the efficiency of schools to which grants of public money are given (this argument has become somewhat out of date owing to the recent substitution of "inspection" for examination as a test of the efficiency of schools; a combination of inspection and examination is also sometimes used); (xiv.) they serve as a necessary incentive to studies (applied, apparently, this is that the incentive is a bad one, and that with efficient teachers it is unnecessary); (xv.) they show both student and teacher where they have failed (unnecessary for efficient teachers); (xvi.) though possibly harmful to the highest class of men, they are good for the mass (reply: no system which damages the highest class of men is tolerable); (xvii.) they are indispensable as an impartial means of selecting men for the civil service; (xviii.) in a difficult examination like the first class civil service examination the qualities of quickness of comprehension, industry, concentration, power of rapidly passing
EXARCH—EXCELLENT

from one subject to another, good health, are necessary for success, though not tested directly, and these qualities are valuable in any kind of work (this appears to be incontrovertible); (xix.) examination records show that success in examinations is generally followed by success in after-life, and the test is therefore efficient (it does not follow that certain candidates are more efficient); (xx.) as a plea for purely "external examinations," teachers cannot be trusted to be impartial and it is better for a boy to " cram " than to curry favour with his teacher (Latham).

The brief comments in brackets, appended above to the arguments, merely indicate what has been said or can be said on the other side. It can scarcely be doubted that in spite of the powerful objections that have been advanced against examinations, they are, in the view of the majority of English people, an indispensable element in the social organization of a highly supports for 1890 or so, and for which, p. 360; John J. Hart on all decisions to committees rather than to individuals. But in view of the extreme importance of the matter, and especially of the evidence that, for some cause or other (which may or may not be the examination system), intellectual interest and initiative seem to diminish in many cases very markedly during school and college life in England, the whole subject seems to call for a searching and impartial inquiry.

EXARCH (ἐξάρχη, a chief person or leader), a title that has been conferred at different periods on certain chief officers or governors, both in secular and ecclesiastical matters. Of these, the most important were the exarchs of Ravenna (q.v.). In the ecclesiastical organization the exarch of a dioce (the word being here used of the political division) was in the 4th and 5th centuries the same as primate. This dignity was intermediate between the patriarchal and the metropolitan, the name of the individual bearing it being restricted after A.D. 451 to the chief bishop of the most important cities (see PATRIARCH). The title of Exarch was also formerly given in the Eastern Church to a general or superior over several monasteries, and to certain ecclesiastics deputed by the patriarch of Constantinople to collect the tribute payable by the Church to the Turkish government. In the modern Greek Church an exarch is a deputy, or legate a latere, of the patriarch, whose office it is to visit the clergy and churches in the provinces allotted to him. The title of exarch has been borne by the head of the Bulgarian Church (q.v. BULGARS), since 1877. It is not, by the law of Scotland, essential to an exarch. Chiefly in favour of the class of cottars and small feudals, and for convenience in straightening marches, the law will consider the most informal memonanda, and even a verbal agreement, if supported by the subsequent possession. The power to excamb was gradually conferred on entitled proprietors. The Montgomery Act, which was passed in 1770, to facilitate agricultural improvements, permitted 50 acres arable and 100 acres not fit for the plough to be excambed. This was enlarged by the Rosebery Act in 1836, under which one-fourth of an entailed estate, not including the mansion-house, sides, parks and wood, was excambed, the provision being that the heir provided the heirs took no higher grasmess (O.E. gersum, fine) than 2500. The power was applied to the whole estate by the Rutherford Act of 1848, and the necessary consents of substitute heirs are now regulated by the entail (Scotland) Act 1882.

EXCELLENCY (Lat. excellenteria, excellence), a title or predicate of honour. The earliest records of its use are associated with the Frank and Lombard kings; e.g. Anastasius Bibliothecarius (d, c. 886) in his life of Pope Honorius refers to Charlemagne as "his excellency" (ēius excellentiae); and during the middle ages it was freely applied to or assumed by emperors, kings and sovereign princes generally, though rather as a rhetorical flourish than as a part of their formal style. Its use is well illustrated in the various charters in the Red Book of the exchequer, where the addresses to the king vary between "your excellency," "your dignity" (vestra dignitas), "your sublimity" (vestra sublimitas) and the like, according to the taste and inventiveness of the writers. Du Cange also gives examples of the style excellenteria being applied to the pope and even to a bishop (in a charter of 1182). With the gradual stereotyping of titles of honour that of " excellency" was definitely superseded by the case of foreign and the lowest rank about the middle of the 13th century, by those of "higness" and "grace," and later by "majesty," first assumed in England by King Henry VIII.
Dukes and counts of the Empire and the Italian reigning princes continued, however, to be "excellencies" for a while longer. In 1593 the bestowal of the title of excellence by Henry IV. of France on the duc de Nevers, his ambassador at Rome, set a precedent; this academic title was followed from the time of the treaty of Westphalia (1648). This, together with the reservation in 1640 of the title of "eminence" (q.v.) to the cardinals, led the Italian princes to adopt the style of "higness" (aliazza) instead of "excellency." In France, from 1654 onwards, the title of excellence was given to all high civil and military officials, and this example was followed in Germany in the 18th century.

The subsequent fate of the title varies very greatly in different countries. In Great Britain it is borne by the viceroy of India, the lord-lieutenant of Ireland, all governors of colonies andambassadress of Great Britain who is part of the official styleof the governors of states, but not of that of the president; however, though diplomatic usage varies in this respect, some states (e.g. France) conceding to him the style of "excellency," others (e.g. Belgium) refusing it. The custom of other republics differs: in France the president is addressed as excellence by courtesy; in Switzerland the title is omitted; in the South American republics it is part of the official style (Pradier-Fodéré, Cours de droit diplôm. i. 86). In Spain the title of excellencia properly belonged to the grandees and to those who had the right to be covered in the royal presence, but it is also possessed by certain officers, clerics, ministers, governors, captains-general, lieutenants-general, ambassadors, and knights of the Golden Fleece. In Austria the title Excellenz belongs properly to privy councillors. It has, however, gradually been extended by custom to all the higher military commands from lieutenant-field-marshall upwards. Ministers, even when not privy councillors, are styled Excellenz. In Germany the title is borne by the imperial chancellor, the principal secretaries of state, ministers and Oberpräsidenten in Prussia, by generals from the rank of lieutenant-general upwards, by the chief court officials, and it is also sometimes bestowed and title to one in consideration of service to offices of a diplomatic character. In Russia the title of Excellency is very common, being borne by all officials from major-general upwards and by all officials above the rank of acting privy councillor. Officers and officials of the highest rank have the title of "high excellency." Finally, in Italy, the title eccellanza, which had come to be used in the republics of Venice and Genoa as the usual form of address to nobles, has become as meaningless as the English title of "esquire" or the address of "sir," being, especially in the south, the usual form of address to any stranger.

In the United States the title of excellency is technically reserved to ambassadors, but in addressing envoy, also this form is commonly used by courtesy. (W.A.P.)

EXCHANGE, in general, the action of mutual giving and receiving objects, interests, benefits, rights, &c. The word comes through the French from the Late Lat. excambiium (see EXCAMBION). The present article deals with the theory and practice of exchange in monetary transactions, but this may conveniently be prefaced by a brief statement as to the law relating to the exchange of property and other matters. In English law exchange is defined as the mutual grant of equal interests in property by one in consideration of the other, and the common law conveyance had certain restrictions, e.g. identity in quantity of interest, fee-simple for fee-simple, &c., entry to perfect the conveyance, and an implied warranty of title and right of entry by either party in case of eviction. Such exchanges are now affected by mutual conveyances with the usual covenants for title. Exchanges are also frequently made by order of the Board of Agriculture under the Inclosure Acts, and there are also statutes enabling ecclesiastical corporations to exchange benefits with the approval of the ecclesiastical commissioners. The international exchange of territories is effected by treaties. The exchange of prisoners of war is regulated by documents called "cartels" (Med. Lat. cartellus, diminutive of carta, paper, bill), which specify a certain agreed-on value for each rank of prisoners. The practice superseded the older one of ransom at the end of a war. By the Regimental Exchanges Act 1875 the sovereign may by regulation authorize exchanges by officers from one regiment to another. (For "labour exchanges" see UNEMPLOYMENT.)

Exchange in relation to money affairs denotes a species of barter not of goods but of the value of goods, a payment in one place being exchanged for a payment in another place. The popular statement of the theory of exchange represents four principals involved in two transactions. A and B are two persons residing in one place different from the domicile of C and D; A sells goods to C; B buys goods from D; A sells his claim on C to B, who remits it to D in satisfaction of his debt, and D receives the cash from C, so that, assuming the two transactions to be of equal value, one piece of paper satisfies the four parties to these two transactions, and the trouble, expense and risk of sending money from both places are avoided. The piece of paper which performs the service may be a telegraphic order, cheque or bill of exchange. In this elementary proposition there would be no difficulty of exchange, as the full value of A's claim on C would be paid for by B, who is under the necessity of sending in exactly similar amount of money to D; but it can be seen that in actual practice the claims of one place on another place would not be exactly balanced by the necessities of the one place to meet obligations in the other place; thus arises the complication of exchange, which may best be described as the price of monetary claims to each other, or the price of paper exchange to the gold or currency in each country.

Supposing, for example, that A in London had a claim on C in Edinburgh amounting to £500, and that B in London did not require to remit more than £500 to D in Edinburgh, it is evident that B in London must be offered some inducement to take over the whole of A's claim. B might give A £500:10:0, and could then, after satisfying his debt to D, have £10 to his credit in Edinburgh, which he could retain there at interest until he had incurred further liability to D, or he could have the balance of £10 returned him in coin at an expense, say, of sixpence; this would leave B with a profit of sixpence on the transaction, and, if the exchange rate between London and Edinburgh in 1875 was £1 for £1 shilling, the bill of exchange in London would be one shilling discount per £100.

Supposing the necessities of B induced him to offer A only £99:14:0 for his £100 claim, A would then prefer that C remitted him £100 in coin, which, on the above scale of expenses, would cost £s. and A would receive £99:15:0 net. On these premises, exchange on Edinburgh in London cannot fall below ¾% discount, and the same circumstances prevent it from rising above ¾% premium, for, in no case, would pay more for A's claim than £100 plus the cost of sending coin to Scotland. If this basis be appreciated, all exchange problems between different countries can be mastered, and the quotations in the daily papers of cable payments, sight drafts (cheques) and long bills are then understood and supply an interesting indication of the state of international financial relations. As shown above, the balance of indebtedness must eventually be remitted by coin, and consequently when exchange in any city is quoted at one or other of the limit points given in our example as ¾% discount or ¾% premium, this exchange immediately acquires a very serious importance, because with the development of modern monetary systems under which enormous trade is carried on with a minimum of cash, the leniency or weakness of the foundations of that strengthening or strengthening of that foundation is a very vital matter.

While the understanding of the theory is essential for any facile interpretation of an exchange, there are of course innumerable details of practice which require to be known to identify the limit points of exchange in any particular city. The limit points can only be taken advantage of by banking experts, and, although we assume a trader remitting his indebtedness in coin when he is asked to pay too high a price for his bill of exchange, in actual affairs the banker will supply the cheque or bill and himself will do the professional business of sending away bullion. Similarly, we have represented one trader drawing on another trader and selling his draft to a third trader who remits the draft to a fourth. In actual practice, however, No. 1 draws on No. 2 and disposes of his draft to a banker; No. 4 draws on No. 3 and sells his draft to a banker; because, speaking generally, whenever
EXCHANGE

London in the money of the foreign country, as it makes comparison with the foreign rate on London very slight. Some foreign countries quote exchange on London in pence, and then, of course, in relation to those countries the same practice will obtain in England, but the majority of the exchange quotations on London are in francs, marks, gulden, lire, kronen or other foreign money. Another point which must be explained is the reason why exchange varies between what we have called the limit points; why there is sometimes so much demand for bills on London and why at other times so many bills are being offered. Similar causes operate on other exchanges, and if we develop the New York case we shall provide explanations for exchange movements in other countries.

At one time the financial relations between England and Africa were such as to enable the principal creditor of the United States, and the latter country had to remit continually very large amounts in payment of interest on English money and profits on English investments, in payment for shipping freights, for banking commissions, insurance premiums and an immense variety of services, besides paying for the large imports which crossed the Atlantic from English ports. In the fall of the year these payments would be more than offset by the enormous exports of food-stuffs, cotton, tobacco, &c., so that during the first half of the year exchange would be at or about the limit of 4-86 and gold would have to be sent from New York to supplement the deficiency of bills. In the autumn the produce bills would flood the exchange market and gold would be sent from London as exchange got to the other limit point of 4-84. These conditions are still very potent, but latterly another element has entered into the position, and the new development is so powerful as to reverse sometimes what we may call the natural and legitimate movement in the exchange. This new element is the more intimate banking and financial relationship which has been established between the two countries. As American conditions have become more stable, with better security for capital and an assured feeling about the currency of the United States, bankers in London have gladly allowed their banking friends in New York and other large cities to draw bills on London whenever there was a good demand for sterling remittances. We have, therefore, to consider a fresh type of bill of which the drawer has no claim on the drawer, but, on the other hand, incurs a debt to the drawer. To take a very usual method, a banker in Wall Street, New York, will advance money to stockbrokers, investors and speculators against bonds and shares with a 20% margin. He deposits this security with a trust company in New York which acts both for the American and English banker. The Wall Street banker then draws a bill of 60 days' sight or 90 days' sight on the banker in Lombard Street and sells this draft to supply the money he lends the stockbroker. Two or three months hence the New York banker must send money to London with which to meet the bill, so that, whereas, in the case of a commercial bill, the produce is despatched and in due course the consignee must find the money for the bill, in the case of a finance bill, as it is called, the bill is drawn and in due course the drawer must send the value with which it is to be honoured. In any event the acceptor, the London banker, has to pay the bill, so that it will be easily understood that relations of the kind we have are not new between London and New York. On other exchange and drawer before finance bills of this class can be created.

The profit arising from the transaction we have sketched is realized by the separate parties in this way. The New York banker lends money for three months, say, at 5% per annum, he pays a commission of 3% to the trust company which has custody of the security, a charge equivalent to 1% interest per annum. He draws on London at 90 days' sight and sells the bill at 4-83$, the cable rate being 4-87$, the buyer of a three months' bill making the allowance for the English bill stamp of $ per millie and the London discount rate of 3%. The drawer of the bill must also pay a commission of 3% to the London banker who accepts the draft; this is equivalent to another 1% per annum in the rate of discount, so that money raised in this way costs 5% for the trust company, 3% the London discount rate,
about 1\% for bill stamps, and 3\% for London commission—altogether, 44\%; and, as the money is loaned at 3\%, there appears to be 1\% profit to the drawer of the bill. This, however, is on the assumption that the cable rate is still 4.87\% when the bill falls due for payment and that the drawer would have to pay that price to telegraph the money to meet the draft. But exchange on London can go up or down between 4.84 and 4.89%, and if at the end of the three months the cable rate is 4.84 the New York banker will be able to cover his bill at almost the same rate at which he sold it and will only be out of pocket to the extent of the commissions and stamps, so that the accommodation will only cost him 1\% and his profit will be 33\%. If he has to pay 4.89\% for his cable at the maturity of the bill his profit will be less than 1\%, and he may even be a loser on the transaction.

It is obvious, then, that a high rate of interest in New York, with a high rate of exchange on London and a low rate of discount in England, would induce the creation of these finance bills. The supply of these bills would prevent New York exchange reaching the limit point at which gold leaves the United States, and the maturity of these bills in the autumn would ensure a demand for the produce bills and possibly prevent exchange falling to the other limit point at which London has been in the past and gold to New York.

We have pointed out the essential difference between these finance bills and what we have called produce bills, but there is another very striking difference, that of the question of supply.

These finance bills are obviously very difficult to limit in their amounts; produce bills are, of course, limited by the extent of the surplus crops of the United States and by the demand for the produce in Europe, but so long as it is mutually satisfactory to the big finance houses in both countries to draw on credit granted in London, so long may these accommodation bills be created, and the pressure of the bills in New York may depress exchange so much that gold leaves London at a time when it is required in other directions. In such a case the embarrassment caused by this artificial drain of the gold reserve would much more than offset the amount of the commission earned by the accepting houses. The Bank of England may have to raise its rate of discount at the expense of the entire home trade; probably, also, with the rise in the value of money, consequent on the diminished resources, all investment securities fall in value and more onerous terms must be submitted to by the government, corporations and colonies, in the issue of any loans they may require. It will, therefore, be appreciated that, although these finance bills may be perfectly safe, their excessive creation is viewed with great disfavour, and considerable apprehension is felt when the adventures of speculators in New York make great demands for loans against stocks and shares, and, through the instrumentality of these finance bills, shift the burden on to the shoulders of the London discount market. The effect of this is to level money rates as between New York and London, and in the process the pressure falls on London and the relief goes to America. Eventually, of course, the bills must be met and funds sent for that purpose from across the Atlantic, but in the meanwhile the disturbance of the gold supply is an inconvenience.

We have explained the process of employing credits granted in London to finance Wall Street; there are, also, many other types of bill to which the acceptor lends his name on the assurance that he will in due course be supplied with the funds required to meet the acceptance. In the case of the produce bills, a London banker will accept the bills in order that they may be more easily marketable than if they were drawn direct on the active commodity of the cotton, tobacco or wheat. The consignees in Liverpool, &c., pay a commission for this assistance and reimburse the London bank as the produce is gradually disposed of. The transaction appears slightly more complicated when English bankers accept bills for produce shipped from the United States to merchants living in Hamburg, Genoa, Singapore and all other great ports, but the principle is the same, and the influence of such business on the exchange affects, in the first instance, the quotation between America and London, but afterwards, when money must be sent to London with which to honour the bills, the exchanges with Germany, Italy or the Straits Settlements bear their share in the eventual adjustment, the spinners, tobacco manufacturers and corn factors requiring drafts on London where so much of the trade of the world is financed.

We shall have to consider later the reasons which ensure to London this peculiar and predominant position. We have so far used the American exchange as an example to explain causes which produce fluctuations in all the principal exchanges on London, and to show the points between which fluctuations are arrested. The fact that America is still developing at a much greater rate than the Old World makes an important distinction between the financial position in New York and the financial position of the big capitals in Europe. There is not in America the huge accumulation of savings and investment money which the Old World has collected, so that whereas Europe helps to finance the United States, the latter country has so many home enterprises that she can spare none of her funds to assist Europe. It would not be possible for London to draw on New York such bills as we have described as finance bills, for they could never be discounted there except on the most onerous terms, and there is nothing in America which corresponds to the London money market.

We have to deal with dollars and cents in America, with francs in France, with marks in Germany, and different money units in nearly every country; but, given the mint regulations, the theoretical par of exchange and the theoretical limit points are arrived at by simple arithmetic. An exhaustive statement with reference to every country would involve an amount of tedious repetition, so that for the purposes of this article it is more instructive to consider the essential differences between the important exchanges than to go into the details of coinage, which would appeal rather to the numismatist than to the exchange expert.

The United States, offering as it does a vast field for profitable investment, must annually remit huge amounts for interest on bonds and shares held by Europeans; coupons and dividend warrants payable in America are offered for sale daily in London, and at the end of the quarters the amount of these claims, coupons and drawn bonds is very large, and a considerable set off to the indebtedness of Europe for American produce. It is often asserted that the United States is rapidly getting sufficiently wealthy to buy all these bonds and shares; but whenever trade conditions are exceptionally good in the States, fresh evidence is forthcoming that assistance from London and Europe is essential to finance the commercial development of the United States. This illustrates a feature common to all new countries, and the effect is that they make annual payments to the older countries and especially to England.

A government loan or other large borrowing arranged abroad will immediately move the exchange in favour of the borrowing country. A tendency adverse to the United States results from the drafts and letters of credit of the large number of holiday makers who cross the Atlantic and spend so much money in Europe. When remittance is made of the incomes of Americans who have taken up their residence in the Old World the exchange is affected in a similar manner.

In one respect the United States stands far superior to most of the older countries. There are no restrictions on the free export of gold when exchange reaches the limit point showing that the demand for bills on London exceeds the supply. New York (with London and India) is a free gold market, and this is undoubtedly one of the reasons why money is so readily advanced to the United States, and the finance bills, to which we referred above, would not be allowed to the same extent were it not for the fact that New York will remit gold when other forms of remittance are insufficient to satisfy foreign creditors. When exchange between Paris and London reaches the theoretical limit point of 25/32 (25 francs 32 centimes for the £1 sterling), gold does not leave Paris for London unless the Bank of France is
willing to allow it. By law, silver is also legal tender in France, and if the State Bank is pressed for gold a premium will be charged for it if it is supplied. Gold may be collected on cheaper terms in small amounts from the great trading corporations or from the offices of the railways, but a large shipment can only be made by special arrangement with the Bank of France. Similarly, in Germany, where a gold standard is supposed to obtain, if a banker requires a large amount of gold from the Reichsbank he is warned that he had better not take it, and if he persists he incurs the displeasure of the government institution to the prejudice of his business, so that the theoretical limit point of 20 marks 52 pf. to the pound sterling has no practical significance, and gold cannot be secured from Berlin when exchange is against that city, and Germany has, when put to the test, a large number of cases where it is not possible to import gold into the United States, and no government interference with the natural course of paying debts. On the other hand, when monetary conditions in New York indicate a great shortage of funds, and rates of interest are uncomfortably high, the United States treasury has sometimes parted with some of its revenue accumulations to the principal New York bankers on condition that they at once engage a similar amount of gold for import from abroad, which shall be turned over to the treasury on arrival. As these advances are made free of interest the effect is to adjust the limit point of 484 to about 485, and the United States treasury seems to have taken a leaf out of the book of the German Reichsbank, which frequently offers similar facilities to gold importers and creates an artificial limit point in the Berlin Exchange. The Reichsbank gives credit in Berlin for gold that has only got as far as Hamburg, and sometimes gives so many days' credit that the agent in London of German banking houses can afford an extravagant price for bar gold and even risk the loss in weight on a withdrawal of sovereigns, although the exchange may not have fallen to the other limit point of 20:32. In England the only effort that is made to attract gold is some action by the Bank of England in the direction of raising discount rates, occasionally, also the Bank's outbids other purchasers for the arrivals of raw gold from South Africa, Australia and other mining countries. Quite exceptionally, for instance during the Boer War, the Bank of England allowed advances free of interest against gold shipped to London.

Many of the principal banking houses in all the important capitals receive continually throughout the day telegraphic information of the tendency and movement of all the exchanges, and on the smallest margin of profit a large business is done in what is called arbitrage (q.v.). For instance, cheques or bills on London will be bought by X in Paris and remitted to Y in London. X will recoup himself by selling a cable payment on Z in New York. Z will put himself in a position to settle the cable payment by selling 60 days' sight drafts on Y, who pays the 60 days' drafts at maturity out of the proceeds of the cheques or bills received from Paris, and this complicated transaction, involving no outlay of capital, must show some minute profit after all expense of bill stamps, discount, cables and commissions has been allowed for. Such business is very difficult and very technical. The arbitrageur must be in first-class credit, must make the most exact calculation, and be prompt to take advantage of the small differences in exchange, differences which can be only temporary, as these operations soon bring about an adjustment.

The European exchanges with which London is chiefly concerned are Paris and Berlin, through which centres most of the financial business of the rest of Europe is conducted; for example, Scandinavia, Russia and Austria bank more largely with Berlin than elsewhere. Italy, Switzerland, Belgium and Spain bank chiefly in Paris. European claims on London or debts to London are settled mostly through Germany or France, and consequently the German and French rates of exchange are affected by the relation of England with the rest of the Continent. The exchanges on Paris and Berlin are therefore most carefully watched by all those big interests which are concerned with the rate of discount and the value of money in London.

If the Paris cheque falls to 25:12, gold arrivals in the London bullion market will be taken by French bankers unless the profit shown by the exchange on some other country enables other buyers to pay more for the gold than Paris can afford. If the Paris cheque falls still further, it would pay to take sovereigns from the Bank of England for export, and so much would be taken as would satisfy the demand to send money to France, or until the consequent scarcity of money in London made rates of interest so high in England that French bankers would prefer to leave money and perhaps increase their balances. As between London and Paris and Berlin the greatest factor operating the exchanges is the relative value of money in the three centres. There is no great excess of trade balance at any season in favour of Germany or France and against England. On the other hand European relations between those countries should be very intimate, and if funds can be very profitably employed in one of these places, there will be a good demand for remittance, and exchange will move in favour of that place, that is to say, exchange will go towards that limit point at which gold will be sent. The great pastoral and agricultural countries like South America, Egypt and India are in a position to draw very largely on London when their crops or other products are ready for shipment. In the early months of the year gold goes freely to South America to pay for the cereals, hides and meat, and in the autumn Egypt and India send such quantities of cotton and wheat that exchange moves heavily in favour of those countries, and gold must go out to adjust the trade balance. During the rest of the year the gold tends to return as these countries always require bills on London or some form of payment to meet interest and dividends on European money invested in their government debts, railways and trading enterprises, and to pay for the European manufactures which they import. Exchange then moves in favour of England, and the Bank of England can replenish its reserve. Over the greater part of the world the rate of exchange on London is an indication simply of the trade balance. The greater part of the world receives payment for food stuffs, and has to pay for European manufactures, shipping freights, banking services and professional commissions.

The greatest complication in exchange questions arises when we have to deal with a country employing a silver standard, and, fortunately for the development of trade, this problem has disappeared of late years in the case of India, Ceylon, Japan, Mexico and the Straits Settlements, and now the only important country using silver as a standard is China. When the monetary standard in one country is only a commodity in another country we are as far removed from the ideal of an international currency as can be imagined. We can fix no limit points to the exchange and we cannot establish a theoretical pair of exchange. The price of silver in the gold-using country may vary a great deal as the gold tends to return as these countries always require bills on London or some form of payment to meet interest and dividends on European money invested in their government debts, railways and trading enterprises, and to pay for the European manufactures which they import. Exchange then moves in favour of England, and the Bank of England can replenish its reserve. Over the greater part of the world the rate of exchange on London is an indication simply of the trade balance. The greater part of the world receives payment for food stuffs, and has to pay for European manufactures, shipping freights, banking services and professional commissions.

The easiest method of explaining the position is to consider that any one in a gold-using country having a claim in currency on a silver-using country has to offer for sale so many ounces of silver, and vice versa the exporter in a silver-using country sending produce to London has to offer a draft representing so many ounces of gold. This introduces a very unsatisfactory element to take a practical example—a tea-grower in China has raised his crop in spite of the usual experience of weather and labour difficulties and the endless risks that a planter must face; the tea is then sent to London to take its chance of good or bad prices, and at the same time the planter has a draft to sell representing locally a certain weight of gold; now, in addition to all the risks of weather and trading conditions, and the chances of the fluctuations in the tea market, he is compelled to gamble in the metal market on the price of gold. Some years ago when a large number of important countries employed a silver standard it was seriously suggested that a fixed ratio should be agreed internationally at which gold and silver should be exchanged. This advocacy of bimetallism (q.v.) was especially persistent at a time when silver had suffered a very great fall in price and the
prominent exponents could generally be identified either as extremely practical men who were interested in the price of silver, or as very inexperienced theorists. The difficulty of the two standards was successfully solved by discarding the use of silver, and the chief silver-using countries adopted a gold standard which has given greater security for the investment of foreign capital, simplified business and brought about a large increase of trade.

In the case of a country of which the government has been subject to great financial difficulties, gold has been shipped so long as the supply held out, and the exchange with such a country will continue to move adversely with every fresh political embarrassment and any other economic cause reflecting on the national credit. With the collapse of the monarchy in Brazil the value of the milreis fell from 175 to 9d., and all the Spanish-American countries have from time to time afforded most distressing examples of the demoralizing effects on the currency of unstable and reckless administration. In Europe similar results have been shown by the mistrust inspired by the governments of Spain, Greece, Italy and some other states. The raising of revenue by the use of the printing press creates an inconvertible and depreciating paper currency which frightens foreign capital and severely taxes the unfortunate country which must make payment abroad for the service of debt and other obligations. With the tardy appreciation of the old proverb that "honesty is the best policy" nearly every country of importance has made strenuous efforts to improve the integrity of its money.

Exchange quotations are not published from many of the British colonies, as their financial business is in the hands of a comparatively few excellently managed banks, which establish, by agreement, conventional exchanges fixed for a considerable period, notably in the case of Australia, New Zealand and South Africa. The Scottish and Irish banks supply similar examples of a monopoly in exchange.

The following table taken from the money article of a London daily paper indicates the exchanges which are of most interest to England—

EXCHEQUER. The word "exchequer" is the English form of the Fr. échiquier, low Lat. saccastarium, and its primary meaning is a chess-board (see Chess). As the name of a government department dealing with accounts it is derived from the exchequer or the "abacus" by means of which such accounts were kept, such a contrivance being almost universally in use before the introduction of the Arabic notation. In England the department or court of accounts was named originally "the tallies" from the notched sticks or tallies which constituted the primitive means of account-keeping (which were only abolished in 1830), and was only subsequently, probably in the reign of Henry III, named the exchequer from the use of the abacus. Both the words and the general features of the institution may reasonably be attributed to Norman influence, since we find both in Normandy and in the Norman kingdom of Sicily, as well as in Scotland and Ireland; the two latter cases being directly due to English example. As a court of law the exchequer owed its existence in England, as elsewhere, to the necessity of deciding legal questions arising from matters of account, and its secondary activities soon overshadowed its original functions.

We cannot say whether the exchequer, as known in England, is older than the beginning of the 12th century. The treasury, which may be regarded as one of its constituents, dates from before the conquest, and the officers of the exchequer who were drawn from the treasury staff can be traced back to Domesday. But our earliest information about the exchequer itself, apart from that afforded by the pipe rolls (see RECORD), rests on a
treatise (*Dialogus de Scaccario*) written about A.D. 1179 by Richard, bishop of London and treasurer of England. His father, Nigel, bishop of Ely, had been treasurer of Henry I., and nephew to that king's great financial minister Roger, bishop of Salisbury. Nigel is said to have reconstructed the exchequer after the troubles of Stephen's reign upon the model which he inherited from his uncle. The Angevin, or rather the Norman, exchequer cannot be regarded in strictness as a permanent department. It consisted of two parts: the lower exchequer, which was closely connected with the permanent treasury and was an office for the receipt and payment of money; and the upper exchequer, which was a court sitting twice a year to settle accounts and thus nearly related to the Curia Regis (q.v.). We dare hardly say that either exchequer existed in vacuo; indeed the word (like the word "diet") seems to have been limited at first to the actual sitting of the king's court for financial purposes. The Michaelmas and Easter exchequers were the sessions of this court "at the exchequer" or chess-board as it had previously sat "at the tality." The constitution of the court was that of the normal Frankish curia. The king was the nominal president, and the court consisted of his great officers of state and his barons, or tenants-in-chief, and it is doubtful due to the fact that the exchequer was originally the curia itself sitting for a special purpose that its unofficial judges retained the name of "barons" until recent times. Of the great officers we may probably find the steward in the person of the justiciar, the normal president of the court. He sat at the head of the exchequer table. The butter was not represented. The chancellor sat on the justiciar's left; he was custodian of the seal of the court, and thus responsible for the issue of all writs and summonses, and moreover for the keeping of a duplicate roll of accounts embodying the judgments of the court. On the left of the chancellor, and thus clear of the table, since their services might be required elsewhere at any moment, sat the constable, the two chamberlains and the marshal. The constable was the chief of the outdoor service of the court, and was responsible for everything connected with the army, or with hunting and hawking. The two chamberlains were the lay colleagues of the treasurer, and shared with him the duty of receiving and paying money, and keeping safe the seal of the court, and all the records and other contents of the treasury. The marshal, who was subordinate to the constable, shared his duties, and was specially responsible for the custody of prisoners and of the vouchers produced by accountants. At the head of the table on the justiciar's right sat, in Henry II.'s time, an extraordinary member of the court, the bishop of Winchester. The treasurer, like the chancellor a clerk, sat at the head of the right-hand side of the table. He charged the accountants with their fixed debts, and dictated the contents of the great roll of accounts (or pipe roll) which embodied the decisions of the court as to the indebtedness of the sheriffs and other accountants. These persons with certain subordinates constituted the court of accounts, or upper exchequer, whereas the lower exchequer, or exchequer of receipt, consisted almost exclusively of the subordinates of the treasurer and chamberlains. In the upper exchequer the justiciar appointed the calculator, who exhibited the state of each account by means of counters on the exchequer table, so that the proceedings of the court might be clear to the presumably illiterate sheriff. The calculator sat in the centre of the side of the table on the president's left. The chancellor's staff consisted of the Magister Scriptori (probably the ancestor of the modern master of the rolls), whose duties were not stated; a clerk (the modern chancellor of the exchequer) who settled the form of all writs and summonses, charged the sheriff with all fines and amercements, and acted as a check on the treasurer in the composition of the great roll; and a scribe (afterwards the comptroller of the pipe), who wrote out the writs and summonses and kept a duplicate of the great roll, known as the chancellor's roll. The constable's subordinates were the marshal and a clerk, who, besides the duty of paying outdoor servants of the crown, had the special task of producing duplicates of all writs issued by the Curia Regis. The treasurer and chamberlains, being colleagues, had a joint staff, the clerical or literate members of which were servants of the treasurer, while the lay or illiterate members depended on the chamberlains. Hence while the treasurer and his clerks kept their accounts by means of rolls, the chamberlains and their serjeants duplicated them so far as possible by means of tallies. Thus the great roll was written by the treasurer's scribe (the engrosser, afterwards the clerk of the pipe), while the payments on account and other allowances to be credited to the sheriff were registered by the tally cutter of the chamberlains.

In the exchequer of receipt the staff was similarly divided between the treasurer and chamberlains; the treasurer having a clerk who kept the issue and receipt rolls (the later clerk of the pells) and four tellers, while each of the chamberlains was represented by a knight (afterwards the deputy chamberlains), who controlled the clerk's account by means of tallies, and held their lands by this serjeancy; these three had joint control of the treasury, and could not act independently. The other serjeants were the knight or "pesour" who weighed the money, the meler who assayed it, and the ushers of the two exchequers. It should be noted that all the lay offices of the treasury in both exchequers were hereditary. Henry II. had also a personal clerk who supervised the proceedings personally in the upper, and by deputy in the lower, exchequer.

The business of the ancient exchequer was primarily financial, although we know that some judicial business was done there and that the court of common pleas was derived from it rather than from the curia proper. The principal accountants were the sheriffs, who were bound, as the king's principal financial agents, to keep a proper account of their stewardship twice a year, at the exchequers of Easter and Michaelmas. Half the annual revenue was payable at Easter, and at Michaelmas the balance was exacted, and the accounts made up for the year, and formally enrolled on the pipe roll. The fixed revenue consisted of the farms of the king's demesne lands within the counties, of the county mints, and of certain boroughs (see Borough) which paid annual sums as the price of their liberties. Danegeld was also regarded as fixed revenue, though after the accession of Henry II. it was not frequently levied. There were also rents of assarts and purpurresses and mining and other royalties. The casual revenue consisted of the profits of the feudal incidents (escheat, warship and marriage), of the profits of justice (amercements, and goods of felons and outlaws), and of fines, or payments made by the king's subjects to secure grants of land, warships or marriages, and of immunities, as well as for the hastening and sometimes the delaying of justice. Besides this, there were the revenues arising from aids and scutages of the king's military tenants, tallages of the crown lands, customs of ports, and special "gifts," or general assessments made on particular occasions. For the collection of all these the sheriff was primarily responsible, though in some cases the accountants dealt directly with the exchequer, and were bound to make their appearance in person on the day when the sheriff accounted.

We gather both from tradition and from the example of the Scottish exchequer that the farms of demesne lands were originally paid in kind, by way of purveyance for the royal household, and although such farms are expressed even in Domesday Book in terms of money, the tradition that there was a system of customary valuation is a sufficient explanation, and not of itself incredible. At some date, possibly under the administration of Roger of Salisbury, the inconvenience of this arrangement led to the substitution of money payments at the exchequer. The rapid deterioration of a small silver coinage led to successive efforts to maintain the value of these payments, first by a "scale" deduction of 6d. in the £ for wear, then by the substitution of payment by weight for payment by tale, and finally by the reduction of most of such payments to their pure silver value by means of an assay, a process originally confined to payments from particular manors. Only the farms of counties, however, were so treated, and not all of those. The amount to be deducted in these cases was settled by the weighing and assaying of a specimen pound of silver in the presence of the sheriff by the pesour and the meler in the lower exchequer. The casual
EXCHEQUER

revenue was paid by tale, and for the determination of its amount it was necessary to have copies of all grants made in the chancery on which rents were reserved, or fines payable. These were known first as contrabrevis and later as originalia; the profits of justice were settled by the delivery of "estreats" from the justices, while for certain minor casualties the oath of the sheriff was at first the only security. At a later date many of them were determined by copies of inquisitions sent in from the chancery. All this business might be transacted anywhere in England, and though convention placed the exchequer first at Winchester (where the treasury was), and afterwards usually at Westminster, it held occasional sessions at other towns even in the 14th century.

The Angevin exchequer, described by Richard the Treasurer, remained the ideal of the institution throughout its history, and the lineaments of the original exemplar were never completely effaced; but the rapid increase both of financial and judicial business led to a multiplication of machinery and a growing complexity of constitution. Even in the time of Henry II. we find that the great officers of state, except the treasurer and chancellor, commonly attended by deputy. In the reign of Henry III. the chancellor had also ceased to attend, and his clerk acquired the title of chancellor of the exchequer. To the same period belongs the institution of the king's and lord treasurer's remembrancers. These at first had common duties and kept duplicate rolls, but by the ordinance of 1233 their functions were differentiated. Henceforward the king's remembrancer was more particularly concerned with the casual, and the lord treasurer's remembrancer with the fixed revenue. The former put all debts in charge, while the latter saw to it only when they had found their way on to the great roll. Hence the preliminary stages of each account, the receiving and registering of the king's writs to the treasurer and barons, and the drawing up of all particulars of account, lay with the king's remembrancer, and he retained the corresponding vouchers. The lord treasurer's remembrancer exacted the "remanets" of such accounts as had been enrolled, as well as reserved rents and fixed revenue, and so became closely connected with the clerk of the pipe. Before the end of the 14th century these three offices had already crystallized into separate departments.

In the meantime the increasing length and variety of accounts, as well as the growth of judicial business, had led to various efforts at reform. As early as 22 Henry II. it became necessary to remove from the great roll the debts which it seemed hopeless to levy, and further ordinances to the same end were made by statute in 54 Henry III. and in 12 Edward I. By this last a special "exannual roll" was established in which the "desperate debts" were recorded, in order that the sheriff might be reminded of them yearly without their overloading the great roll. But the largest accession of financial business arose from the "foreign accounts," that is to say, the accounts of national services, which did not naturally form part of the account of any county. These did not in the reign of Henry II. form a part of the exchequer business. Such expenses as appear on the pipe roll were paid by the sheriffs, or by the bailiffs of "honours"; payments out of the treasury itself would only appear on the receipt and issue rolls, and the spending departments probably drew their supplies from the camera curie, and not directly from the exchequer. In the course of the 13th century the exchequer gradually acquired partial control of these national accounts. Even in 18 Henry II. there is an account for the purchase of Alexandria and soon after, the pipe roll and the escheators followed. The undated statute of the exchequer (probably about 1276) provides for escheators, the earldom of Chester, the Channel Islands, the customs and the wardrobe. During the reign of Edward I., the wardrobe account became unmanageable, since it not only financed the household, army, navy and diplomatic service, but raised money on the customs independently of the exchequer. The reform of 1323-1326, due to Walter de Stapledon, in remedying this state of things, greatly increased the number of "foreign accounts" by making the great wardrobe (the storekeeping department), the butler, purveyors, keepers of horses or of the stud, the clerks of the "hamper" of the chancery (who took the fees for the great seal), and the various ambassadors, directly accountable to the exchequer. At the same time the sheriffs' accounts were expedit ed by the further simplification of the great roll, and by appointing a special officer, the "foreign apposer," to take the account of the "green wax," or estreats, so that two accounts could go on at once. Another baron (the 9th or curator baron) was appointed, and the whole business of foreign accounts was transferred to a separate building where one baron and certain auditors spent their whole time in settling the balances due on the accounts already mentioned, as well as those of castles, &c., not to farm, Wales, Gascony, Ireland, aids (clerical and lay), temporalities of vacant bishoprics, abbey, priories and dignities, mines of silver and tin, unlage and so forth. These balances were accounted for in the exchequer itself, and entered on the pipe roll, but the preliminary accounts were filed by the king's remembrancer, and enrolled separately by the treasurer's remembrancer as a supplement to the pipe roll.

Besides the two great difficulties of the postponement of financial to legal business, and of preventing the sheriffs from exacting the same debt twice, the exchequer was, as has been seen, hampered in its functions by the interference of other departments in financial matters. Its own branches even acquired a certain independence. The exchequer of the Jews, which came to an end in 18 Edward I., was such a branch. In 27 Henry VIII. the court of augmentations was established to deal with forfeited lands of monasteries. This was followed in 32 & 33 Henry VIII. by the courts of first-fruits and tenth and of general surveyors. These were reabsorbed by the exchequer in 3 Mary, but remained as separate departments within it. But the development of the treasury, which succeeded to the functions of the camera curie or the king's chamber, ultimately reduced the administrative functions of the exchequer to unimportance, and the audit office took over its duties with regard to public accounts. So that when the statute of 3 & 4 William IV. cap. 99, removed the sheriff's accounts also from its competence, and brought to an end the series of pipe rolls which begins in 1190, the ancient exchequer may be said to have come to an end.

In 1834 an act was passed abolishing the old offices of the exchequer, and creating a new exchequer under a comptroller-general, the detailed business of payments formerly made at the exchequer being transferred to the paymaster-general, whose office was further enlarged in 1846 and 1848. And in 1866, as the result of a select committee reporting unfavourably on the system of exchequer control as established in 1834, the exchequer was abolished altogether as a distinct department of state, and a new exchequer and audit department were established.

The ancient term exchequer now survives mainly as the official title of the national banking account of the United Kingdom. This central account is commonly called the exchequer, and its statutory title is "His Majesty's Exchequer." It may also be described with statutory authority as "The Account of the Consolidated Fund of Great Britain and Ireland." This account is, in fact, divided between the Banks of England and Ireland. At the head office of each of these institutions receipts are accepted and payments made on account of the exchequer; but in published documents the two accounts are...

The third column in the above shows the price which has to be paid (in the form of discrepancies between facts and figures) for the simplicity secured to statements and records on the national finance by the present system embodied in the term exchequer. Probably few will think the price too high in consideration of the advantages secured.

The principal official who derives a title from the exchequer in its living sense is, of course, the chancellor of the exchequer. He is the person named second in the patent appointing commissions for executing the office of lord high treasurer of Great Britain and Ireland; but he is appointed chancellor of the exchequer for Great Britain and chancellor of the exchequer for Ireland by two additional patents. Although, in fact, the finance minister of the United Kingdom, he has no statutory power over the exchequer apart from his position as second commissioner of the treasury; but in virtue of his office he is by statute master of the mint, senior commissioner for the reduction of the national debt, a trustee of the British Museum, an ecclesiastical commissioner, a member of the board of agriculture, a commissioner of public works and buildings, local government, and education, a commissioner for regulating the offices of the House of Commons, and has certain functions connected with the office of the secretary of state for India. The only other exchequer officer requiring mention is the
EXCISE

cmpettor and auditor-general, whose functions as comptroller-general of the exchequer have been already described.

The ancient name of the national banking account has been attached to two of the forms of unfunded national debt. Exchequer bills, which date from the reign of William and Mary (then took the place of the tallies, previously used for the same purpose), became extinct in 1897, but exchequer bonds (first issued by Mr Gladstone in 1853) still possess a practical importance.

An exchequer bond is a promise by government to pay a specified sum after a specified period, generally three or five years, and meanwhile to pay interest half-yearly at a specified rate on that sum. Government possesses no general power to issue exchequer bonds; such power is only conferred by a special act, and for specified purposes; but when the power has been created, exchequer bonds issued in pursuance of it are governed by the statutory provisions contained in the Exchequer and Bonds Act 1866, and amending acts. These acts create machinery for the issue of exchequer bonds and for the payment of interest thereon, and protect them against forgery.

Some traces may be mentioned of the ancient uses of the name exchequer which still remain. The chancellor of the exchequer still presides at the ceremony of "pricking the list of sheriffs," which is a quasi-judicial function; and on that occasion he wears a robe of black silk with gold embroidery, which suggests a judicial costume. In England the last judge who was styled baron of the exchequer (Baron Pollock) in 1897 was the brother of the baronet of the exchequer was transferred to the court of session in 1856, but the same act requires the appointment of one of the judges as "lord ordinary in exchequer causes," which office still exists. In Ireland Lord Chief Baron Palles was the last to retain the old title. A street near Dublin Castle is called Exchequer Street, recalling the separate Irish exchequer, which ceased in 1817. The old term also survives in the full title of the treasury representative in Scotland, which is "The King's and the Lord Treasurer's Remembrancer in Exchequer," while his office in the historic Parliament Square is styled "Exchequer Chamber." (S. E. S.-R.)

BIBLIOGRAPHY.—For the early exchequer Thomas Madox's History and Antiquities of the Exchequer (London, 1717) remains the standard authority, and in it the Dialogus de Secario of Richard the Treasurer (1179) was first printed (edited since by A. Hughes, C. G. Crump and C. Johnson, Oxford, 1902). The publications of the Pipe Roll Society (London, 1884 et seq.), the Pipe Rolls and Chancellor's Rolls by the Royal Commissions (London, 1853 and 1854), the Third Report of H. Hall's edition of the Royal Roll of the Third Henry II. (London, 1899) should also be consulted. A popular account is in H. Hall's Court Life under the Plantagenets (London, 1904), of which there is a modern revised edition by Dr Parson's Antiquities (London, 1833). The Comptroller and Auditor General's Reports (London, 1844 et seq.), and their predecessors, are full of interesting facts and official records. For the history of the exchequer the Exchequer and Mainland Surveys (London, 1661), or Sir Geoffrey Gilbert's Treatise on the Court of Exchequer (London, 1758), as well as from the statutes abolishing various offices in the exchequer. H. Hall's Antiquities of the Exchequer (London, 1891) gives many interesting details of various dates. For the Scottish exchequer The Exchequer Rolls of Scotland (Edinburgh, 1878 et seq.) should be consulted, while Gilbert's book noted above gives some details on that of Ireland. See also Appendix 13 to the great account of Public Income and Expenditure from 1888 to 1899, in three volumes, prepared for parliament by H. W. Chisholm (1896); and for sidelights on the working of the office from 1825 to 1860 the reminiscences of the same author (the late chief clerk of the exchequer) in Temple Bar (January to April 1891).

EXCISE (derived through the Dutch, exciss, or occis, possibly from Late Lat. accensare,—ad, to, and, census, tax; the word owes something to a confusion with excusum, cut out), a term now well known in public finance, signifying a duty charged on goods, either in the process of their manufacture, or before their sale to the buyer, by the government. It has been used in the commonwealth somewhat advanced in manufactures, markets and general riches; and it interposes so directly with the industry and liberty of the subject that it has seldom been introduced save in some supreme financial exigency, and has as seldom been borne, even after long usage, with less than the ordinary impiance of taxation. Yet excise duties can boast a respectable antiquity, having a distinct parallel in the rectangular remission (or toll levied on all commodities sold by auction, or in public market) of the Romans. But the Roman excise was mild compared with that of modern nations, having never been more than centesima, or 1% of the value; and it was much shorter lived than the modern examples, having been first imposed by Augustus, reduced for a time one-half by Tiberius, and finally abolished by Caligula, A.D. 38, so that the Roman excise cannot have had a duration of more than half a century. Its remission must have been deemed a great boon in the marts of Rome, since it was commemorated by the inscription "lalli longa" and its originator: with the legend Remissae Centesimae, specimen of which are still to be found in collections.

The history of this branch of revenue in the United Kingdom dates from the period of the civil wars, when the republican government, following the example of Holland, established, as a means of defraying the heavy expenditure of the time, various duties of excise, which the royalists who restored to power found too convenient or too necessary to be abandoned, notwithstanding their origin and their general unpopularity. On the contrary, they were destined to be steadily increased both in number and in amount. It is curious that the first commodities selected for excise were those on which this branch of taxation, after great extension, had again in the period of reform and free trade been in a manner permanently reduced, viz. malt liquors, and such kindred beverages as cider perry and spruce beer. The other excise duties remaining are chiefly in the form of licences, such as to kill game and to use and carry guns, to sell gold and silver plate, to pursue the business of appraisers or auctioneers, hawkers or pedlars, pawnbrokers or patent-medicine vendors, to manufacture tobacco or snuff, to deal in sweets or in foreign wines, to make vinegar, to roast malt, or to use a still in chemistry or otherwise. It may be presumed that the policy of the licentious age at first much to collect revenue, though in the aggregate they yielded a large sum, as to guard the main sources of excise, and to place certain classes of dealers, by registration and an annual payment to the excise, under a direct legal responsibility. The excise system of the United Kingdom as now pruned and reformed, however, while still the most profitable of all the sources of revenue, is simple in process, and is contentedly borne as compared with what was the case in the 18th, and the beginning of the 19th century. The wars with Bonaparte strained the government finances, and excise duties were multiplied and increased in every practicable form. Bricks, candles, calico prints, glass, hides and skins, leather, paper, salt, soap, and other commodities of home manufacture and consumption were placed, with their respective industries, under excise surveillance and fine. When the duties could no longer be increased in number, they were raised in rate. The duty on British spirits, which had begun at a few pence per gallon in 1660, rose step by step to 11s. 8d. per gallon in 1820; and the duty on salt was augmented to three or fourfold its value.

The old unpopularity of excise, though now somewhat out of date, must have had its ground. It breaks out in English literature, from songs and pamphlets to grave political essays and legal commentaries. Blackstone, in quoting the declaration of parliament in 1649 that "excise is the most easy and indifferent levy that can be laid upon the people," adds on his own authority that "from its first original to the present time its very name has been odious to the people of England" (book i. cap. 8, tenth edition, 1786); while the definition of "excise" gravely inserted by Dr Johnson in the Dictionary, at the imminent risk of subjecting the eminent author to a prosecution for libel—viz., a hateful tax levied upon commodities, and adjudged not by the common judges of property, but wretches hired by those to whom excise is paid "—is hardly more accurate.

The duties of excise in the United Kingdom were, until the passing of the Finance Act 1908, under the control of the
EXCOMMUNICATION

commissioners of inland revenue; they are now under the control of the commissioners of customs; the amount raised, apart from changes in the rate, shows a fairly constant tendency to increase, and is usually regarded as one of the best tests of the prosperity of the working classes.

The spirit duty is levied according to the quantity of "proof spirit" contained in the product of distillation, and the charge is taken at three different points in the process of manufacture, the trader being liable for the result of the highest of the three calculations. What is known as "proof spirit" is obtained by mixing nearly equal weights of pure alcohol and water, the quantity of pure alcohol being in bulk about 57% of the whole. Owing to the high rate of duty as compared with the volume and intrinsic value of the spirits, the whole process of manufacture is carried on under the close supervision of revenue officials. All the vessels used are measured by them and are secured with revenue locks; the premises are under constant survey; and notice has to be given by the distiller of the materials used and of the several stages of his operations. Though the charge for duty is raised at the time when the process of distillation is completed, the duty is not actually paid until the spirits are required for consumption. In the meanwhile they may be retained in an approved "warehouse," which is also subject to close supervision.

The beer duty dates from 1880, in which year it was substituted for the duty on malt. The specific gravity of the worts depends chiefly on the amount of sugar which they contain, and is ascertained by the saccharimeter.

Excise licences may be divided into—(a) licences for the sale or manufacture of excisable liquors, (b) licences for other trades, such as tobacco dealers or manufacturers, auctioneers, pawnbrokers, &c., (c) licences for male servants, carriages, motors and armorial bearings, and (d) guns, game and dog licences. Nearly the whole of the licence duties is paid over to the local taxation account.

The railway passenger duty, which was made an excise duty by the Railway Passenger Duty Act 1847, applies only to Great Britain. It is levied on all railway fares exceeding 10 per mile, the rate being 8% on urban and 5% on other traffic.

The other items which go to make up the excise revenue are the charges on deliveries from bonded warehouses, and the duties on coffee mixture labels and on chicory.

For more detailed information reference should be made to Highmore's Excise Laws, and the annual reports of the commissioners of inland revenue, especially those issued in 1870 and 1885. See also Taxation; English Finance.

EXCOMMUNICATION (Lat. ex, out of, away from; communis, common), the judicial exclusion of offenders from the rights and privileges of the religious community to which they belong. The history of the practice of excommunication may be traced through (1) pagan analogues, (2) Hebrew custom, (3) primitive Christian practice, (4) medieval and monastic usage, (5) modern survivals in existing Christian churches.

1. Among pagan analogues are the Gr. χωρίω&omicron; ε&aelig;ργε&omicron;ια (Demosth. 595, 14), the exclusion of an offender from purification with holy water. This exclusion was enforced in the case of persons whose hands were defiled with bloodshed. Its consequences are described Aesch. Choeph. 283, Eunm. 625 f., Soph. Oed. Tyr. 236 ff. The Roman exsseratio and diris deoitio was a solemn pronouncement of a religious curse by priests, intended to call down the divine wrath upon enemies, and to devote them to destruction by powers human and divine. The Druids claimed the dread power of excluding offenders from sacrifice (Caes. B.G. vi. 13). Primitive Semitic customs recognize that when persons are laid under a ban or taboo (herem) restrictions are imposed on contact with them, and that the breach of these involves supernatural dangers. Impious sinners, or enemies of the community and its god, might be devoted to utter destruction.

2. Hebrew Custom.—In a theocracy excommunication is necessarily both a civil and a religious penalty. The word used in the New Testament to describe an excommunicated person, ἀνήρ (1 Cor. xvi. 22, Gal. i. 8-9, Rom. ix. 3), is the Septuagint rendering of the Hebrew herem. The word means "set apart" (cf. harem), and does not distinguish originally between things set apart because devoted to God and things devoted to destruction. Lev. xxvi. 16-34 defines the law for the destruction of "devoted" things; according to v. 28 no devoted thing that a man shall devote unto the Lord, of all that he hath, whether of man or beast, or of the field of his possession, shall be sold or redeemed. None devoted shall be ransomed, he shall surely be put to death." As in Greece and Rome whole cities or nations might be devoted to destruction by pronounce-ment of a ban (Numbers xxii. 2, 3, Deut. ii. 34, iii. 6, vii. 2). Occasionally Israelites as well as aliens fall under the curse (Judg. xxi. 5, 11). A milder form of penalty was the temporary separation or seclusion (niddah) prescribed for ceremonial uncleanliness. This was the ordinary form of religious discipline. In the time of Ezra the Jewish "magistrates and judges" among their ecclesiastico-civil functions have the right of pronouncing sentence whether it be unto death, or to "rooting out," or to confiscation of goods, or to imprisonment (Ezra vii. 26). There is also a lighter form of excommunication which "devotes" the goods of an offender, but only separates him from the congregation. Both major and minor kinds of excommunication are recognized by the Talmud. The lesser (niddah) involved exclusion from the synagogue for thirty days, and other penalties, and might be renewed if the offender remained impenitent. The major excommunication (herem) excluded from the Temple and the synagogue and from all association with the faithful. Spinoza was excommunicated (July 16, 1656) for contempt of the law. Seldon (De jure nat. et gen., iv. 7) gives the text of the curse pronounced on the culprit. The Exemplar Humanae Vitae of Uriel d'Acosta also deserves reference. The practice of the Jewish courts in New Testament times may be inferred from certain passages in the Gospels. Luke vii. 22, John ix. 22, xii. 42 indicate that exclusion from the synagogue was a recognized penalty, and that it was probably inflicted on those who confessed Jesus as the Christ. John xvi. 2 ("Whosoever killeth you," &c.) points to the power of inflicting the major penalty. The Talmud itself says that the judgement of capital cases was taken away from Israel forty years before the destruction of the Temple. "Forty" is probably a round number without historical value, but the circumstance recorded by this tradition and confirmed by the evangelist's account of the trial of Jesus is historical, and is to be regarded as one of several restrictions imposed on the Jewish courts in the time of the Roman procurators.

3. Primitive Christian Practice.—The use of excommunication as a form of Christian discipline is based on the precept of Christ and on apostolic practice. The general principles which govern the action of the religious community may be gathered from the New Testament writings. Matt. xv. 13-20 prescribes a threefold admonition, first privately, then in the presence of witnesses (cf. Titus iii. 10), then before the church. This is a graded procedure as in the Jewish synagogue and makes exclusion a last resort. Nothing is said as to the nature and effects of excommunication. The tone of the passage when compared with the disciplinary methods of the synagogue indicates that its purpose was to introduce elements of reason and moral suasion in place of stern methods. Its object is rather the protection of the church than the punishment of the sinner. The offender is only treated as a guest; accuser and publican when the purity and safety of the church demand it. In the books classics on this subject (1 Cor. v. 5) Paul refers to a formal meeting of the Corinthian church at which the incestuous person is "delivered unto Satan for the destruction of the flesh that the spirit may be saved in the day of the Lord Jesus." These are mysterious words implying (1) a formal ecclesiastical censure, (2) a physical penalty, (3) the hope of a spiritual result. The form of penalty which would meet these conditions is not explained. There is a reference in 2 Cor. ii. 6-11 to a case of discipline which may or may not be the same. If it be the same it indicates that the excommunication had not been final; the offence had been received back. If it be not the same it shows the Corinthian
EXCOMMUNICATION

The concept of excommunication was introduced by the Church in the early Christian era. It was initially used as a disciplinary measure against heretics and individuals who violated Church teachings. Over time, the scope of excommunication expanded to include a variety of offenses, ranging from minor sins to serious crimes against the Church. The process of excommunication involved several stages, including an initial warning, a period of disqualification, and sometimes the removal of ecclesiastical privileges.

In ancient times, the Church exercised discipline independently of apostolic advice. According to church law, excommunication could be imposed by the bishop or a higher authority for a variety of reasons, including heresy, schism, and the refusal to accept an ecclesiastical sentence. The Church considered excommunication to be a serious penalty that was intended to prevent individuals from committing further offenses and to preserve the integrity of the Church.

In the medieval period, the Church regarded excommunication as an important tool for maintaining discipline and order. The practice of excommunication was often used to address issues within the Church itself, such as the corruption of priestly orders, or to punish individuals who were viewed as threats to the Church's authority. The Church was concerned with the behavior of its members and sought to maintain a high standard of conduct among its clergy and laity.

The medieval Church also used excommunication as a means of enforcing its teachings on matters of faith and morals. For example, the Church condemned the practice of usury, and those who were involved in usurious dealings could be subject to excommunication. Similarly, the Church was opposed to the practice of simony, and those who obtained ecclesiastical offices through improper means could be excommunicated.

In the early modern period, the Church continued to use excommunication as a disciplinary measure, but its application became more nuanced. The Church sought to balance the need for discipline with the importance of reconciliation. Excommunication was often accompanied by a period of penance, during which the excommunicated individual was expected to confess their sins and make amends.

In the contemporary era, the use of excommunication is still found in the Church, but its application has undergone significant changes. The Church has sought to ensure that excommunication is used as a last resort and that it is accompanied by a process of reconciliation. The Church has also sought to make sure that excommunication is applied in a manner that is just and equitable, and that it is not used in a manner that would violate the rights of individuals.

In conclusion, excommunication has played an important role in the history of the Church, serving as a means of discipline and protection. The Church continues to use excommunication as a tool for maintaining the integrity of the Church and for ensuring that its teaching and discipline are upheld.

shall incur any civil penalty or incapacity whatever, save such sentence of imprisonment, not exceeding six months, as the court shall direct and certify to the king in chancery.

In the churches which consciously shaped their polity at or after the Reformation the principle of excommunication is preserved in the practice of church discipline. Calvin devotes a chapter in the Institutes (bk. iv. chap. xii.) to the "Discipline of the Church; its Principal Use in Censure and Excommunication." The three ends proposed by the church in such discipline are there stated to be, (1) that those who lead scandalous lives may not to the dishonour of God be numbered among Christians, seeing that the church is the body of Christ; (2) that the good may not be corrupted by constant association with the wicked; (3) that those who are censured or excommunicated, confounded with shame, may be led to repentance. He differentiates decisively between excommunication and anathema. "When Christ promises that what his ministers bind on earth shall be bound in heaven, he limits the power of binding to the censure of the church; by which those who are excommunicated are not cast into eternal ruin and condemnation, but by having their life and conduct condemned are also certified of their final condemnation unless they repent. For excommunication differs from anathema: anathema which ought to be very rarely, or never, resorted to, in precluding all pardon, executes a person, and devotes him to eternal perdition; whereas excommunication rather censures and punishes his conduct. Yet in such a manner by warning him of his future condemnation it recalls him to salvation" (Inst. bk. iv. chap. xii. 10). The Reformed churches in England and America accepted the distinction between public and private censures. The usual provision is that private censures are to be dealt with according to the rule in Matt. v. 23-24, xviii. 15-17; public censures are to be dealt with according to the rule in 1 Cor. v. 5-13. The public expulsion or suspension of the offender is necessary for the good repute of the church, and its influence over the faithful members. The expelled member may be readmitted on showing the fruits of repentance.

In Scotland three degrees of church censure are recognized—admonition, suspension from sealing ordinances (which may be called temporary excommunication), and excommunication properly so-called. Intimation of the last-named censure may occasionally (but very rarely) be given by authority of a presbytery in a public and solemn manner, according to the following formula:—"Whereas thou N. hast been by sufficient proof convicted (here mention the sin) and after due admonition and prayer remainest obstinate without any evidence or sign of true repentance: Therefore in the name of the Lord Jesus Christ, and before this congregation, I pronounce and declare thee N. excommunicated, shut out from the communion of the faithful, debar thee from privileges, and deliver thee unto Satan for the destruction of thy flesh, that thy spirit may be saved in the day of the Lord Jesus." This is called the greater excommunication. The congregation are thereafter warned to shun all unnecessary converse with the excommunicate (see Form of Process, c. 8). Formerly excommunicated persons were deprived of feudal rights in Scotland; but in 1690 all acts enjoining civil pains upon sentences of excommunication were finally repealed (Burton's History, vii. 435).

The question whether the power of excommunication rests in the church or in the clergy has been an important one in the history of English and American churches. Hooker lays down (Surrey, pt. 3, pp. 33-46) four necessary conditions for the execution of a sentence involving excommunication: (1) the judgment or censure being lawfully and equitably to be presented to the consideration of the congregation. (2) The elders are to go before the congregation in laying open the rule so far as reacheth any particular now to be considered, and to express their judgment and determination thereof, so far as appertains to themselves. (3) Unless the people be able to convince them of errors and mistakes in their sentence, they are bound to join their judgment with theirs to the compleating of the sentence. (4) The sentence thus compleatly is to be solemnly passed and pronounced upon the delinquent by the ruling Elder whether it be of censure or excommunication." In this passage it is clear that the effective power of discipline is regarded as being wholly in the power of the individual church or congregation. Hooker expressly denies the power of synods to excommunicate: "that there should be Synods, which have potestatem juridicam is nowhere proved in Scripture because it is not a truth" (Surrey, pt. 4, pp. 48, 49).

The confession of faith issued by the London-Amsterdam church (the original of the Pilgrim Fathers' churches) in 1568 declares that the Christian congregation having power to elect its minister has also power to excommunicate him if the case so require (Walker, Creeds and Platforms of Congregationalism, p. 66). In 1693 the document known as "Points of Difference" (i.e. from the established Anglicanism) submitted to James I. sets forth: "That all particular Churches ought to be so constituted as, having their own peculiar Officers, the whole body of every Church may meet together in one place, and jointly performe their duties to God and one towards another. And that such as refuse to abide in their discipline and excommunication be in due manner executed, for sinne, convicted, and obstinately stood in. This power also to be in the body of the Church whereof the partyes so offending and persisting are members." The Cambridge Platform of 1648 by which the New England churches defined their practice, devotes ch. xiv. to "excommunication and other censures." It follows in the main the line of Hooker and Calvin, but adds (§6) an important definition: "Excommunication being a spiritual punishment it doth not prejudice the excommunicate in, nor deprive him of his civil rights, therfore toucheth not princes, or other magistrates, in point of their own v. or authority. And, the excommunicate being but as a publican and a heathen, heathen being lawfully permitted to come to hear the word in church assemblies; we acknowledge therefore the like liberty of hearing the word, may be permitted to persons excommunicate, that is permitted unto heathen. And because wee are not without hope of his recovery, we are not to account him as an enemy but to admonish him as a brother." The Savoy Declaration of 1658 defines the theory and practice of the older English Nonconformist churches in the section on the "Institution of Churches and the Order appointed in them" (the "Church of Christ") (15-17, xvn. xi.). The "Censures so appointed by Christ, are Admonition and Excommunication; and whereas some offences are or may be known only to some, it is appointed by Christ, that those to whom they are so known, do first admonish the offender in private: in publick offences where any sin, before all; or in case of non-amendment upon private admonition, the offence being related to the Church, and the offender not manifesting his repentance, he is to be duly admonished in the Name of Christ by the whole Church, by the Ministry of the Elders of the Church, and if this Censure prevail not for his repentance, then he is to be cast out by Excommunication with the consent of the Church."

In contemporary English Free Churches the purity of the church is commonly secured by the removal of persons unsuited for membership from the church books by a vote of the responsible authority.

(D. MN.)

EXCRETION (Lat. ex, out of, cere, custum, to separate), in plant and animal physiology, the separation from an organ of some substance, also the substance separated. The term usually refers to the separation of waste or harmful products, as distinguished from "secretion," which refers to products that play a useful or necessary part in the functions of the organism.

EXECUTION (Lat. ex-seguar, execvstus, follow or carry out), the carrying into effect of anything, whether a rite, a piece of music, an office, &c.; and so sometimes involving a notion of skill in the performance. Technically, the word is used in law in the execution of a deed (its formal signing and sealing), an execution (see below) by the sheriff's officers under a "writ of execution" (the enforcement of a judgment on a debtor's goods); and execution of death has been shortened to the one word to denote CAPITAL PUNISHMENT (q.v.).

Civil Execution may be defined as the process by which the
judgments or orders of courts of law are made effectual. In Roman law the earliest mode of execution was the seizure, legalized by the actio per manus injectionem, of the debtor as a slave of the creditor. During the later Republic, imprisonment took the place of slavery. Under the régime of the actio per manus injectionem the debtor, the issue being raised by his making a substitute (sindex) to conduct the case for him. By the time of Galus (IV. 25) the actio per manus injectionem had been superseded by the actio judicati, the object of which was to enable the creditor to take possession of the goods or compel the debtor to find security (pignus in causa judicati captum: Cautil judicatum solvi), and in a.D. 320 Constantine abolished imprisonment for debt, unless the debtor were com-
tumacious. The time allowed for payment of a judgment debt was by the XII. Tables 30 days; it was afterwards extended to two months, and ultimately, by Justinian, to four months. This was subject to the condition of bankruptcy either against the will of the bankrupt (missio in bona) or on the application of the bankrupt (cessio bonorum; and see BANKRUPTCY). Lastly, in the time of Antoninus Pius, judgment debts were directly enforced by the seizure and sale of the debtor’s property. Slaves, oxen and implements of husbandry were privileged; and movable property was to be exhausted before recourse was had to land (see Hunter, Roman Law, 4th ed. pp. 1039 et seq., Sohn, Inst. Rom. Law, 2nd ed. pp. 302-303).

Great Britain.—The English law of execution is very compli-
cated, and only a statement of the principal processes can here be attempted.

High Court.—Fieri Facias. A judgment for the recovery of money or costs is enforced, as a rule, by writ of fieri facias addressed to the sheriff, and directing him to cause to be made (fieri facias) of the goods and chattels of the debtor a levy of a sum sufficient to satisfy the judgment and costs, which carry interest at 4% per annum. The sheriff then shall cause a Register of Sequestra, under the direction of the property of the debtor, which is what popularly known as “the putting-in” of an execution. The seizure should be carried out with all possible dispatch. The sheriff or his officer must not break open the debtor’s house in effecting a seizure, for “man’s house is his castle” (Sennays’ Case [1604], 5 Coke Rep. 91); but this principle applies only to a dwelling-house, and a barn or outhouse connected with the dwelling-house may be broken into. The sheriff on receipt of the writ endorses on it the day, hour, month and year when he received it; and the writ binds the debtor’s goods as at the date of its delivery, except as regards goods sold before seizure in market, or purchased for value, or held against before actual seizure (Sale of Goods Act 1893, s. 26, which supersedes s. 16 of the Statute of Frauds and s. 1 of the Mercantile Law Amend-
ment Act 1865). This rule is limited to goods, and does not apply to personal chattels (Chapman v. The Registrar, 46 Ch. D. 142, C.A.). The sheriff’s Register of Sequestra, so far as respects the writ till seized under it (Johnson v. Pickering, Oct. 11, 1907, C.A.). The mere seizure of the goods, however, although, subject to such exceptions as those just stated, it binds the interest of the debtor, it does not in itself confer an interest sufficient to sue for the recovery of their possession, does not pass the property in the goods to the sheriff. The goods are in the custody of the sheriff, but he is bound to sell them on requisition of the execution creditor to the extent of his claim. The Bankruptcy Act 1890 (53 & 54 Vict. c. 71, s. 11 [2]) requires the sheriff in case of sale under a judgment directing the execution of a judg-
ment to sell, to proceed with all convenient speed. But if in case of bankruptcy proceedings should be served upon him (see BANKRUPTCY). The form of the writ of fieri facias requires the sheriff to enter his return to the registered copy of the writ; but unless the execution has been ineffective or there has been delay in the execution of the writ; but the judgment creditor may obtain an order calling on the sheriff to make a return. A sheriff or his officer, who shall neglect to comply with a writ of execution, is liable to commit for contempt, and to forfeit £200 and pay all damages suffered by the person aggrieved (Sheriffs Act 1887 [50 & 51 Vict. c. 55], s. 29 [2]), besides being civilly liable to such person. Imprisonment for debt in execution of civil judgments is now abolished except in cases of default in the nature of contumacy, such as refusal to answer a writ of execution, or refusal to pay judgment, or defaults by judgment debtors (Debtor Acts 1869 [32 & 33 Vict. c. 62]; Bankruptcy Act 1883 [46 & 47 Vict. c. 52], ss. 33, 103). Imprisonment for debt has been abolished within the jurisdiction of the courts in Scotland (S.W. 1883, 46 & 47 Vict. c. 34, and Ireland, Debtors [Ireland] Act 1872, 55 & 56 Vict. c. 57). There may still be imprisonment in England, under the original practice exhibited in practicae exequiarum, which issues to prevent a debtor from doing the kind of act which constitutes the

Writ of Eject.—The writ of eject is a process enabling the creditor to satisfy his judgment debt out of the lands of the debtor. It seems to have come from the feudal practice of the mode of recovery. It is founded on the Statute of Westminster (1285, 13 Ed. 1. c. 18), under which the sheriff was required to deliver to the creditor all the chattels (except oxen and beasts of the plough) and the goods and lands of the debtor; and until the Judgments Act 1838 the remedy was extended to all the debtor’s lands, and by the Bankruptcy Act 1883 the writ no longer extends to the debtor’s goods. The writ is enforceable against legal interests whether in possession or remainder (Hood-Barrs v. Catheby, 1865, 2 Ch. 411), but not against equitable interests in land (Earl of Jersey v. Oxbridge Rural Sanitary Authority, 1881, 3 Ch. 183). When the debtor’s interest is equitable, recourse is had to equitable execution by the appointment of a receiver or to bankruptcy proceedings.

The writ is directed to the sheriff, who, after marking on it the date of its receipt, at once in pursuance of its directions holds an inquest upon the lands to be delivered (Exe. 1883, 46 & 47 Vict. c. 52, q. 29); the sheriff has to give notice of the same, and a copy of the notices, to the person in whose name the judgment proceeds are registered, with a copy of the sheriff’s return. The writ is directed to the sheriff at a reasonable price and extent in accordance with the writ, the lands of which the debtor was possessed in the baulk. It is the business of the sheriff, after delivering the copy of the order (office of the High Court) of the writ and the execution thereof, the execution creditor becomes “tenant to the eject.” Where the writ of eject is held the sheriff at a reasonable price and extent in which the land is leasehold he acquires the whole of the debtor’s interest (Johns v. Pink, 1900, 1 Ch. 296). The creditor is entitled to hold the land till his debt is satisfied, or enough to satisfy it is tendered to him, and under the Judgments Act 1864 the creditor may obtain an order for sale. Until the land is delivered on execution and the writs which have effected the delivery are registered as to the sheriff, who makes charge of the land so as to let the debtor’s power of dealing with it, and Registered Charges Registration Acts 1888 and 1900. (See R.S.C., xii. [3]).

Writs of Possession and Delivery.—Judgments for the recovery of the possession of land are enforceable by the writ of delivery. The recovery of specific chattels is obtained by writ of delivery (R.S.C., 1865, xii. [3]).

Writ of Sequestration.—Where a judgment directing the possession of the property of the debtor to be delivered to the execution creditor has been obtained, the execution creditor may have “attac" debts due to third parties to his debtor by what are known as garnishee proced-
ings. Stock and shares belonging to a judgment debtor may be charged by a charging order, so as, in the first instance, to prevent transfer of the stock or payment of the dividends, and ultimately to enable the judgment creditor to realise his charge. A writ of attachement of the person of a defaulting debtor or party may be obtained in a variety of cases akin to contempt (e.g. against a person who is indispensable for the purpose of an action). A writ of attachment of goods may be obtained on the application of a solicitor not entering an appearance in an action, in breach of his written undertaking to do so, and in the cases where imprisonment for debt is still preserved by the Debtors Act 1869 (R.S.C., 1865, xii.).

Contempt of Court (q.v.). In its ordinary forms is also punishable by summary committal.

County Courts.—In the county courts the chief mode of execution as of old is the sale by auction. In the nature of a writ of fieri facias ; garnishee proceedings; equitable execution; warrants of possession and delivery, corresponding to the writ of possession and delivery above mentioned, have been substituted. The chief difference between the date of the judgment has had, means to pay his debt; and attachment of the person for contempt of court. If the judg-
ment debtor assaults the bailiff or his officer or rescues the goods, he is liable to committal for contumacy.

Scotland.—The principal modes of execution or “ diligence” in Scots law are (1.) Arrestment and forthcoming, which corresponds to the English garnishee proceedings; (ii.) arrestment jurisdictionum fundandae causa, i.e. the seizure of movables within the jurisdiction
EXECUTORS AND ADMINISTRATORS

The law of execution under the Quebec Code resembles that of the English system in which it evolved. The doctrine of real property and the rules for the sale of property on execution have been substantially the same as in England. The "homestead law" (a legend) which is in force in nearly all American States except a certain area of real estate exempted by a homeowner, is based on a concept of right to keep his homestead, seized from a forced sale for the payment of his debts. The homestead law has been copied in some British colonies, e.g. Western Australia (No. 57 of 1898, Pt. viii.), Quebec (Rev. Stats., ss. 1743-1748), Manitoba (Rev. Stats., c. 43, s. 21), Ontario (Rev. Stats., c. 29, s. 29), British Columbia (Rev. Stats., c. 93), New South Wales (Crown Lands Act 1895, Pt. iii.), New Zealand (Family Homes Protection Act 1895, No. 20 of 1895).

British Possessions.—The Judicature Acts of most of the Colonies have also adopted English Law. Parts of the French Code civil are still in force in Mauritius. But its provisions have been modified by local enactment (No. 19 of 1868) as regards real, and the rules of the Supreme Court 1903 have introduced the English forms of writs. Quebec and St. Lucia, where formerly prevails, have now their own codes of Civil Procedure.

The law of execution under the Quebec Code resembles the French, that under the St. Lucia Code the English system. In British Guiana, the Code of 1895, of which English law in other colonies, another prevailing, the English law of execution has now in substance been adopted (British Guiana Rules of Court, 1900, Order xxixv., Ceylon (Code of Civil Procedure, No. 2 of 1892); the modes of execution under the Civil Procedure Code in the subject of a court, largely influenced by English law (cf. the Sheriff's Ordinance, 1902, No. 9 of 1902), (Orange River Colony) and (Proclamations 17 and 18, 1900) (Common law (Saiet-execution) book, p. 2206); and generally, Van Zyl, Judicial Practice of South Africa, pp. 98 et seq.

United States.—Execution in the United States is founded upon the laws which are similar to those in England. Substantially, the same forms of execution are in force. The provisions of the Statute of Frauds making the lien of execution attach only to delivery to the sheriff were generally adopted in America, and are still in full force in the United States, except as to personal property, as to which the law of England is substantially the same as in England. The "homestead laws" (g.v.) which are in force in nearly all the American States exempt a certain area of real estate, and are based on the idea that the homeowner should be allowed to retain his homestead, seized from a forced sale for the payment of his debts. 

It has been already mentioned. Execution against personalty (saies-execution) is preceded by a commandment or summons, personal service of which is required to all those bound to the debtor. These notices are known as the "hand out notices." The necessary binding of debtors and their children residing with them, and the clothes worn by them, cannot be seized in execution under any circumstances. Objects deduced from personalty and the personalty itself (immeubles de cession), such as beasts of burden and agricultural implements, books relating to the debtor's profession, to the value of the 300 francs, workmen's tools, military equipments, provisions and certain cattle cannot be seized, even for a debt due to Government, unless in respect of provisions furnished to the debtor, or amounts due to the manufacturers or vendors of protected articles or to parties who advanced money to purchase, manufacture or repair them. Fresh fruits cannot be seized except during the six weeks preceding the ordinary period when they become ripe. Execution against immovable property (la saisie immobiliere) is preceded also by a summons to pay, and a writ of possession (the motto: service of such summons (see further Code Civ. Proc., Arts. 673-689).

Imprisonment for debt was abolished in all civil and commercial matters by the law of 22nd of July 1867, which extends to foreigners. It has been replaced by a writ of attachment (saisie-execution)and a writ of transfer of the burdens of the obligation (saisie-effet), and is not subject to the rules of priority.

The French system is in substance in force in Belgium (Code Civ. Proc., Arts. 51 et seq.), the Netherlands (Code Civ. Proc., Arts. 320 et seq.) and in Italy (Codice Civ. Proc., Arts. 690 et seq.), and Spain (Code Civ. Proc., Arts. 690 et seq.), and Germany.—Under the German Code of Civil Procedure (Art. 796 et seq.), both the goods and (if the goods do not offer adequate security) the person of the debtor may be seized (the process is called arrestement et saisie). The seizure of property for sale on execution may be sold except in pursuance of a judgment notified to the debtor either before or within a prescribed period after the execution (Art. 809 [3] and [1] of 30th of April 1880). Imprisonment for debt and seizure of property are based on the provisions of the French law of 1867 in many countries (e.g. Italy, law of the 6th of December 1877; Belgium, law of the 27th of July 1871; Germany, law of the 9th of March 1900; Russia, decree of the 10th of March 1879).

EXECUTORS AND ADMINISTRATORS, in English law, those persons upon whom the property of a deceased person both real and personal devolves according as he has or has not left a will. Executors differ from administrators both in the mode of their creation and in the date at which their estate vests. An executor can only be appointed by the will of his testator; such appointment may be express or implied, and in the latter case he is said to be an executor "according to the tenor." The estate of an executor vests in him from the date of the testator's death. An administrator on the other hand is appointed by the probate division of the High Court of Justice, when the deceased person has not left a will or residuary appointment, the title to the property being vested till then in the judge of the probate division. As to whom the court will appoint administrators and the various kinds of administrators see under ADMINISTRATION. Apart from these two points the rights and liabilities of executors and administrators are the same, and they may be indifferently referred to as the representative of the deceased. As to their appointment before the establishment of the Court of probate see articles WILL and INTESTACY.

Before the Land Transfer Act 1897, the real estate of the deceased did not devolve upon the representative but was retained in the hands of the deceased. It was provided that the personal representative should be the real representative, and therefore it may now be said broadly that the representative takes the whole estate of the deceased. There are, however, a few minor exceptions to this rule, of which the most important are lands held in joint tenancy and copyhold lands. As the representative stands in the shoes of the deceased he is entitled to sue upon any contract or for any debt which the deceased might have sued in his lifetime.

The duties of a representative are as follows: 1. To bury the deceased in a manner suitable to the estate he leaves behind him; and the expenses of such funeral take precedence of any duty or debt whatever; but extravagant expenses will not be allowed. No rule can be laid down as to what is a reasonable allowance for funeral expenses, as it is impossible to know in what the estate of the deceased may amount to. The broad rule is that the representative must allow such sum as seems reasonable, according to the expenses of the funeral or to the value in life of the deceased, remembering that if he should exceed this he will be personally liable for such excess in the event of the estate proving insolvent.

4. To obtain probate or letters of administration to the deceased within six months of the death, or, if such grant be disputed, within two months of the determination of such suit. The penalty for not doing so is fixed by the Statute 1818, § 47, at 100, and an additional stamp duty at the rate of 10% As to the formalities of PROBATE see this article.

3. Strictly speaking, he must compile an inventory of all the estate of the deceased, whether in possession or outstanding, and he is to deliver it to the court on oath. He is to collect all the goods so inventoried and to commence actions to get in all those outstanding, and he is responsible to creditors for the whole of such estate, whether outstanding or in possession. This estate should be representative by an act of 1529, but it is not the modern practice to exhibit such inventory unless he is cited for it in the judicial court at the instance of a party interested. It is, however, necessary that he should make such inquiry as will enable him to determine upon applying for a grant of probate or letters of administration.

4. The representative may pay the debts of the deceased according to their priority. Notices to the legitimate funeral expenses come the costs of proving and administering the estate; in the event, however, of the funeral and testamentary expenses being charged by the will upon any particular fund, they will be primarily payable out of such fund. The representative may pay the debts of the deceased according to the rules of priority; otherwise he will become personally liable to the creditors of one degree if he has exhausted another paying creditors of a lesser degree. First of all, a solicitor has an absolute duty, which has been recovered for the deceased; next in order come debts due to the crown by record or speciality; then debts given a priority by statute, as, for example, by the Poor Relief Act 1743, money due by an overseer of the poor to his parish. Next, debts of record, i.e.
judgment recovered against the deceased in any court of record; all such debts are equal among themselves, but a judgment creditor who has sued out execution is preferred to one who has not; another class of debts of record are statutes merchant and staple, or recognizances of the same kind, and the act of 1669 for the sequestration of property before the lord mayor of London or the mayor of the staple. Last in the order of debts come simplicity and simple contract debts, which by the 9 Will. & Mar. 24th. 12 & 13 Geo. III ch. 40, debts of both descriptions are charged upon each other over the assets of the estate, though a between simplicity debts bonds given for value rank before voluntary bonds unless assigned for value, and as between simple contract debts those due to the crown have priority. These rules are in full if necessary, and all the assets of the deceased to satisfy their claims, yet as between the various classes of assets the representative may pay the debts out of assets in the following order: (i) General personal estate not specifically bequeathed by the will, not chargeable to the assets appropriated to debts; (ii) real estate descended; (iv) real estate devised charged with payment of debts; (v) general personal legacies and devises (specific bequeathed) devised out of the estate over which a general power of appointment has been exercised by will; (viii) the widow's paraspheralia.

5. The debts of the deceased being satisfied, the representative must next proceed to satisfy the legacies and residuary legatee the testator. In order to enable him to do this with safety to himself, it is provided that he cannot be compelled to divide the estate among the legatees or next of kin until twelve months from the death of the testator, as this is commonly known as "the executor's year 2", though if there is no doubt as to the solvency of the estate he may do so at once. As further protection the representative may have a prima facie advertisement of legatees to whom claims against the estate, and on expiration of the notices he may proceed to divide the estate, though even then the creditor may follow the assets to the person who has received them and recover for himself. In the case of legatees at law, the presumption is observed: (1) Specific legates and devises, (2) demonstrative legatees, and (3) general legatees; and as to this last class the testator can give priority to one over another. If there are not sufficient assets to pay the general legatees they must be ratably charged. Legacies were not payable out of the real estate prior to the Land Transfer Act 1897, unless the testator charged the realty with them. Even then the testator can have a prima facie advertisement of legatees to whom the legacies the personality will be the first fund chargeable. It has been suggested that the effect of the act is to make the reality chargeable pro rata with the personality, but this is doubtful.

6. All legacies and devises as aforesaid must, if there be a will, be paid to the residuary legatee therein named, and if there be no will the real estate will go to the heir (see INHERITANCE) and the personality to the next of kin (see INTESTACY). It was held at one time that in default of a residuary legatee the residue fell to the executor himself, but now nothing less than the expressed intention of the testator can give it to him.

The liabilities of the representative may be shortly stated. He is liable in his representative capacity in all cases where the deceased would be liable were he alive. To this general rule there are some exceptions. The representative cannot be sued for breach of a contract of employment with the testator for the lifetime of the person contracting, nor again can he be sued in a case where unliquidated damages only could have been recovered against the deceased. He is liable in his personal capacity in the following cases: (i) contracts to which he is a party, (ii) if having admitted that he had assets in his hands sufficient to pay a debt or legacy he has misapplied such assets so that he cannot satisfy them; (iii) by mismanagement, the latter appointed of the deceased he has made himself liable for a deestavit. Shortly stated, a representative is bound to exercise the ordinary care of a business man in administering the estate of the deceased, and he will be liable for the loss to the estate caused by his own negligence, or by the negligence of a co-representative whose act or neglect has rendered possible. Though the general rule of delegatus non potest legatum holds good of a representative, yet in certain cases he may "double" persons in the same place, and the sort of this expected to be experienced," e.g. he must employ solicitors to conduct a lawsuit.

The privileges of the representative are these: he may prefer one creditor to another of equal degree; he may retain a debt owing to him from the deceased as against other creditors of equal degree (see RETAINER); he may reimburse himself out of the estate all expenses incurred by him in executing his duties. An executor de son tort is one who, without any title to do so, wrongfully intermeddles with the assets of the deceased, dealing with his property in his own right, as executor. In such a case he is subject to all the liabilities of an executor de son tort, and claim none of the privileges. He may be treated by the creditor as the executor, and, if he is really assuming to act as executor, creditors and legatees have a right to treat him accordingly, unless exempted from the rights of the executor by the rightful representative for damages for interfering with the property of the deceased.

Second. Executor in Scots law has more extensive term than in English. He is either commutative or dative, the latter appointed by the court and corresponding in most respects to the English administrator. Caution is required from the latter, not from the former. By the common law doctrine of passive representation the heir or executor was liable to be sued for implement of the deceased's obligations. The Roman principle of beneficium inventarii was first introduced by an act of 1665. As the law at present stands, the heir or executor is liable only to the value of the succession, except where there has been vicious intromission in movables, and in mature cases: James W. Walker, The Law of Executors and Administrators: 3rd ed. (Boston, 1901). In England the executor is bound to pay the debts of the deceased in a manner consistent with the practice in cases of inheritance. In France they all rank pari passu except privileged debts (see PRIVILEGE).

EXEDRA, or EXHEDRA (from Gr. ἐξεδρα, out and ἑδρα, a seat), an architectural feature of 8th, 9th, and 10th centuries, and applied to a seat or set of seats, intended for conversation. Such recesses were generally semicircular, as in the important example built by Herodes Atticus at Olympia. In the great Roman thermae (baths) they were of large size, and like apses were covered with a hemispherical vault. An example of these exists at Pompeii in the Street of the Tombs. From Vitruvius we learn that they were often covered over, and they are described by him (v. 11) as places leading out of porticoes, where philosophers and rhetoricians could debate or harangue.

EXELMANS, RENÉ JOSEPH ISIDORE. COUNT (1775-1859), marshal of France, was born at Bar-le-Duc on the 13th of November 1775. He volunteered into the 3rd battalion of the Meuse in 1791, became a lieutenant in 1797, and in 1798 was aide-de-camp to General Éblé, and in the following year General Brossier. In his first campaign in Italy he greatly distinguished himself; and in April 1799 he was rewarded for his services by the grade of captain of dragoons. In the same year he took part with honour in the conquest of Naples and was again promoted, and in 1801 he became aide-de-camp to General Murat. He accompanied Murat in the Austrian, Prussian and Polish campaigns of 1805, 1806 and 1807. At the passage of the Danube, and in the action of Wartenberg, he specially distinguished himself; he was made colonel for the valour which he displayed at Austerlitz, and general of brigade for his conduct at Eylau in 1807. In 1808 he accompanied Murat to Spain, but was there made prisoner and conveyed to England. On regaining his liberty in 1811 he went to Naples, where King Joachim Murat appointed him grand-master of horse. Exelmans, however, rejoined the French army on the eve of the Russian campaign, and on the field of Borodino won the rank of general of division. In the retreat from Moscow his steadfast conduct was such as to earn a commission in the Saxon corps of carabiniers. In 1813 he was made, for services in the campaign of Saxony and Silesia, grand-officer of the Legion of Honour, and in 1814 he reaped additional glory by his intrepidity and skill in the campaign of France. When the Bourbons were restored, Exelmans retained his position in the army. In January 1815 he was tried on an accusation of having treasurably relations with Murat, but was acquitted. Napoleon on his return from Elba made Exelmans a peer of France and placed him in command of the II. cavalry corps, which he commanded in the battle of Waterloo. At the campaign of 1815 he commanded the march on Wavre. In the closing operations round Paris Exelmans won great distinction. After the second Restoration he denounced, in the House of Peers, the execution of Lord Napier as an "abominable assassination;" thereafter he lived in exile in Belgium and Nassau for some years, till 1819, when he was recalled to France. In 1828 he was appointed inspector-general of cavalry; and after the July revolution of 1830 he received from Louis Philippe the grand cross of the Legion of Honour, and was reinstated as a peer of France. At the revolution of 1848 Exelmans was one of the adherents of Louis Napoleon; and in 1851 he was, in recognition of his long and brilliant military career, raised to the dignity of a marshal of France. His death, which took place on the 10th of July 1852, was the result of a fall from his horse.
EXQUATUR—EXETER

EXQUATUR, the letter patent, issued by a foreign office and signed by a sovereign, which guarantees to a foreign consul the rights and privileges of his office, and ensures his recognition in the state in which he is appointed to exercise them. If a consul is not appointed by commission he receives no exequatur; and in a notice in the Gazette in this case has to suffice. The exequatur may be withdrawn, but in practice, where a consul is obnoxious, an opportunity is afforded to his government to recall him.

EXETER, EARL, MARQUESS AND DUKE OF. These English titles have been borne at different times by members of the families of Holand or Holland, Beaufort, Courtenay and Cecil. The earls of Devon of the family of Redvers were sometimes called earls of Exeter; but the title of Exeter was John (c. 1355-1400), a younger son of Thomas Holand, earl of Kent (d. 1360). John’s mother, Joan (d. 1385), a descendant of Edward I., married for her third husband Edward the Black Prince, by whom she was the mother of Richard II., and her son John was thus the king’s half-brother, a relationship by which he owed his high station at the English court. He married Elizabeth (d. 1426), a daughter of John of Gaunt, duke of Lancaster, and was constantly in Richard’s train until 1385, when his murder at the hands of Ralph Stafford disturbed these friendly relations. John then removed to the side of the English army under John of Gaunt; but after his return to England in 1387 he was created earl of Huntingdon, was made admiral of the fleet and chamberlain of England, and was again high in the king’s favour. He was Richard’s chief helper in the proceedings against the lords appellant in 1397, was created duke of Exeter in September of this year, and went with the king to Ireland in 1399. After the accession of his brother-in-law, Henry IV., Holand was tried for his share in the events of 1397, and was reduced to his earlier rank of earl of Huntingdon. He was soon plotting against Henry’s life, and after the projected rising in 1400 had failed he was captured and was probably beheaded at Pleshey in Essex on the 16th of January 1400.1 He was afterwards attainted and his titles and lands were forfeited.

In 1416 Thomas Beaufort, earl of Dorset, was created duke of Exeter; but this dignity was only granted for his life, and consequently it expired on his death in 1426.

In 1416 John (1395-1447), son of John Holand, the former duke of Exeter, was allowed to take his father’s earldom of Huntingdon. This nobleman rendered great assistance to Henry V. in his conquest of France, fighting both on sea and on land. He was marshal of England, admiral of the fleet of the English governour of Aquitaine under Henry VI.; he was one of the king’s representatives at the conference of Arras in 1435; and in 1443 was created duke of Exeter. When he died on the 8th of August 1447 his titles passed to his son Henry (1430-1473), who, although married to Anne (d. 1476), daughter of Richard, duke of York, fought for Henry VI. during the Wars of the Roses. After having been imprisoned by York at Pontefract, he was present at the battle of Towton, sailed with Henry’s queen, Margaret of Anjou, to Pander’s in 1463, and was wounded at Barnet in 1471. In 1466 he had been attainted and his dukedom declared forfeited, and he died without sons, probably in 1473.

Coming to the family of Courtenay the title of marquess of Exeter was borne by Henry Courtenay (c. 1496-1558), earl of Devon, who was made a marquess in 1532. A grandson of Edward IV., Courtenay was a prominent figure at the court of Henry VIII., until Thomas Cromwell rose to power, when his high birth, his great wealth and his independent position made him an object of suspicion. Some slight discontent in the west of England gave the occasion for his arrest, and he was tried and beheaded on the 9th of December 1538. A few days later he was declared a traitor and his titles were forfeited; although his only son, Edward (c. 1536-1556), was restored to the earldom of Devon in 1539 and was a suitor for the hand of Queen Mary, is sometimes called marquess of Exeter.

The title of earl of Exeter was first bestowed upon the Cecils (see Cecil: Family) in 1605 when Thomas, 2nd Lord Burghley (1554-1623), the eldest son of William Cecil, Lord Burghley, was made earl of Exeter by James I. Thomas had been a member of parliament during the reign of Queen Elizabeth, who knighted him in 1575, and had fought under the earl of Leicester in the Netherlands. After his father’s death in 1598 he became president of the Council of the North and was made a knight of the Garter. He died on the 7th or 8th of February 1623. His direct descendants continued to bear the title of earl of Exeter, the 10th earl (Henry (1574-1684)), the 10th earl, was advanced to the dignity of marquess of Exeter, but the marquessate, being his lineal descendant, may be noted that the 1st marquess is Tennyson’s “lord of Burghley.”

See G. E. Cokayne, Complete Peerage (1887-1898).

EXETER, a city and county of a city, municipal, county and parliamentary borough, and the county town of Devonshire, England, 172 m. W.S.W. of London, on the London & South Western and the Great Western railways. Pop. (1901) 47,185. The ancient city occupies a broad ridge of land, which rises steeply from the left bank of the Exe. At the head of the ridge is the cathedral, and in the British earthwork. The High Street and its continuation, called Fore Street, are narrow, but very picturesque, with many houses of the 16th and 17th centuries. There is a maze of lesser streets within the ancient walls, the line of which may be traced. All the gates have disappeared. The suburbs, which have greatly extended since the beginning of the 19th century, contain many good streets, terraces and detached villas. The surrounding country is rich, fertile and of great beauty. Extensive views are commanded in the direction of Haldon, a stretch of high moorland which may be regarded as an outlier of Dartmoor. The lofty mound of the castle, with the features of the English, is the most interesting object in the town.

The cathedral, although not one of the largest in England, is unsurpassed in the beauty of its architecture and the richness of its details. With the exception of the Norman transeptal towers, the general character is Decorated, ranging from about 1280 to 1360. Transeptal towers occur elsewhere in England only in the collegiate church of Ottery St Mary, in Devonshire, for which Exeter cathedral served as a model. The west front is of later date than the rest (probably 1360-1394), and the porch is wholly covered with statues. Within, the most noteworthy features are the long unbroken roof, extending throughout the nave and choir, with no central tower or lantern; the beautiful sculpture of bosses and corbels; the minstrel’s gallery, projecting from the north tricorium of the nave; and the remarkable manner in which the several parts of the church are made to correspond. The window tracery is much varied; but each window answers to that on the opposite side of nave or choir; pier answers to pier, aisle to aisle, and chapel to chapel, while the transeptal towers complete the balance of parts. A complete restoration under Sir G. G. Scott was carried out between 1870 and 1877. The modern stonework, the reredos, the choir pavement, the rich marble and, with the stained glass, the sculptured pulpit in choir and nave are preserved. The episcopal throne, a sheaf of tabernacle work in wood, was erected by Bishop Stapeldon about 1320, and in the north transept is an ancient clock. The most interesting monuments are those of bishops of the 13th and 14th centuries, in the choir and lady chapel. Some important MSS., including the famous book of Saxon poetry given by Leofric to his cathedral, are preserved in the chapter-house. The united sees of Devonshire and Cornwall were fixed at Exeter from the installation there of Leofric (1050) by the Connexor, until the re-election of the Cornish see in 1876. The bishop’s palace embodies Early English portions. The diocese covers the greater part of Devonshire, with a very small part of Dorsetshire.

The guildhall in the High Street is a picturesque Elizabethan building, which contains some interesting portraits; among them being one of General Monk, who was a native of Devon,

1 There is some difference of opinion about the place and manner of the earl’s death, and this question has an important bearing upon the privilege of trial by peers of the realm. See L. W. Vernon-Harcourt, His Grace the Steward and Trial of Peers (1907).
and another of Henrietta, duchess of Orleans, given by her brother Charles II. Both are by Sir Peter Lely. The assize hall and sessions house dates from 1774. The Albert Memorial Museum contains a school of art, an excellent free library, a reading-room, and a museum of natural history and antiquities. There is a good collection of local birds, and some remarkable pottery and bronze relics extracted from barrows near Honiton or found in various parts of Devonshire. Of the castle, called Rougemont, the chief architectural remnant is a portion of a gateway tower which may be late Norman. Traces are also seen of the surrounding earthworks, which may have belonged to the original British stronghold. Beneath the castle wall is the pleasant promenade of Northernhay. The churches of Exeter are of little importance, being mostly small, and closely beset with buildings; the most modern is St Michael's. The Devon and Exeter Institution, founded in 1813, contains a large and valuable library, and among educational establishments may be noticed the technical and university extension college, the diocesan training college and school; and the grammar school, which was founded under a scheme of Walter de Stapeldon, bishop of Exeter and founder of Exeter College, Oxford, in 1333, and re-founded in 1629, but occupies modern buildings (1886) outside the city. It is endowed with a large number of leaving exhibitions, and about 150 boys are educated. There are two market-houses in the city, many hospitals and many charitable institutions, including the picturesque hospital or almshouse of John Wyndham, recorder of Exeter (1439).

Exeter is one of the principal railway centres in the south-west, and it also has some shipping trade, communicating with the sea by way of the Exeter ship-canal, originally cut in the reign of Elizabeth (1564), and enlarged in 1675 and 1827. This canal is an interesting work, being the first canal carried out in the United Kingdom for the purpose of enabling sea-going vessels to pass to an inland port. The river Exe was very early utilized by small craft trading to Exeter, parliament having granted power for building the canal by the construction of a canal 3 m. long from Exeter to the river; at a later date this canal was extended lower down to the tidal estuary of the Exe. Previous to the year 1520 it was only available for vessels of a draft not exceeding 9 ft., but by deepening it, raising the banks, and constructing new locks, vessels drawing 14 ft. of water were enabled to pass up to a basin and wharves at Exeter. These works were carried out under the advice of Thomas Telford. A floating basin is accessible to vessels of 350 tons. Larger vessels lie at Topsham, at the junction of the canal with the estuary of the Exe; while at the mouth of the estuary is the port of Exmouth. Imports are miscellaneous, whereas paper, grain, cider and other goods are exported. Brewing, paper-making and iron-founding are carried on, and the city is an important centre of agricultural trade. The parliamentary borough returns one member. The city is governed by a mayor, 14 aldermen and 42 councillors. Area, 3158 acres. The eastern suburb of Heavitree, where is the Exeter city asylum, is an urban district with a population (1901) of 7529.

Exeter was the Romano-British country town of Isca Dumnorum—a most westerly town in the south-west of Roman Britain. Mosaic pavements, potsherds, coins and other relics have been found, and probably traces of the Roman walls survive here and there in the medieval walls. It is said to be the Caer Isca of the Britons, and its importance as a British stronghold is shown by the great earthwork which the Britons threw up to defend it, on the site of which the castle was afterwards built, and by the number of roads which branch from it. Exeter is famous for the number of siege which it sustained as the chief town in the south-west of England. In 1001 it was unsuccessfully besieged by the Danes, but in the following year was given by King Aethelred to Queen Emma, who appointed as reeve, Hugh, a Frenchman, owing to whose treachery it was taken and destroyed by Sweyn in 1014. In 1050, however, it had recovered and was chosen by Leofric as the new seat of the bishops of Devon. In 1068, after a siege of eighteen days, Exeter surrendered to the Conqueror, who threw up a castle which was called Rouge-mont, from the colour of the rock on which it stood. Again in 1137 the town was held for Matilda by Baldwin de Redvers for three months and surrendered, at last, owing to lack of water. Three times subsequently Exeter held out successfully for the king—in 1467 against the Yorkists, in 1497 against Perkin Warbeck, and in 1549 against the men of Cornwall and Devon, who rose in defence of the old religion. During the civil wars the city declared for parliament, but was in 1643 taken by the royalists, who held it until 1646. The only other historical event of importance is the entry of William, prince of Orange, in 1688, shortly after his arrival in England. Exeter was evidently a borough by prescription some time before the Conquest, since the burgesses are mentioned in the Domesday Survey. Its corporate rights were granted by Henry II. to safeguard all the free customs which the citizens of London enjoyed, and was confirmed and enlarged by most of the succeeding kings. By 1227 government by a reeve had given place to that by a mayor and four balliffs, which continued until the Municipal Reform Act of 1835. Numerous trade gilds were incorporated in Exeter, one of the first being the tailors' gild, incorporated in 1466. This by 1482 had become so powerful that it interfered with the government of the town, and was dissolved on the petition of the burgesses. Another powerful gild was that of the merchant adventurers, incorporated in 1550, which is said to have dictated laws to which the mayor and balliffs submitted. From 1295 to 1835 Exeter was represented in parliament by two members, in the latter year the number of representatives was reduced to one. Exeter was formerly noted for the manufacture of woolen goods, introduced in Elizabeth's reign, and the value of its exports at one time exceeded half a million sterling yearly. The trade declined partly owing to the stringent laws of the trade gilds, and by the beginning of the 19th century had entirely disappeared, although at the time of its greatest prosperity it had been surpassed in value and importance only by that of London.

See Victoria County History, Devon: Richard Izacke, Antiquities of the City of Exeter (1677); George Oliver, The History of the City of Exeter (1861); and E. A. Freeman, Exeter ("Historic Towns" series) (London, 1887), in the preface to which the names of earlier historians of the city are given.

EXETER, a town and one of the county-seats of Rockingham county, New Hampshire, U.S.A., on the Squamscott river, about 12 m. S.W. of Portsmouth and about 51 m. N. by E. of E. of Boston, Mass. Pop. (1890) 4284; (1900) 4922 (1669 born-foreign); (1910) 4897; area, about 17 sq. m. It is served by the Western Division of the Boston & Maine railway. The town has a public library and some old houses built in the colonial period, and is the seat of Phillips Exeter Academy (incorporated in 1781 and opened in 1785). In its charter this institution is described as "an academy for the purpose of promoting piety and virtue, and for the education of youth in the English, Latin and Greek languages, in writing, arithmetic, music and the art of speaking, practical geometry, logic and geography, and such other of the liberal arts and sciences or languages, as opportunity may hereafter permit." It was founded by Dr John Phillips (1719-1759), a graduate of Harvard College, who acquired considerable wealth as a merchant at Exeter and gave nearly all of it to the cause of education. The academy is one of the foremost secondary schools in the country, and among its alumni have been Daniel Webster, Edward Everett, Lewis Cass (born in Exeter in a house still standing), John Parker Hale, George Bancroft, Jared Sparks, John Gorham Palfrey, Richard Hildreth and Francis Bowen. The government of the academy is vested in a board of six trustees, regarding whom the founder provided that a majority should be laymen and not inhabitants of Exeter. In 1900-1910 the institution had 20 buildings, 32 acres of recreation grounds, 16 instructors and 488 students, representing 35 states and territories of the United States and 4 foreign countries. At Exeter also is the Robinson female seminary (1787) with 12 instructors and 22 students (in 1887).

The river furnishes water-power, and among the manufactures of the town are shoes, machinery, cottons, brass, &c.
The town is one of the oldest in the state; it was founded in 1638 by Rev. John Wheelwright, an Antinomian leader who with a number of followers settled here after his banishment from Massachusetts. For their government the settlers adopted (1639) a plantation covenant. There was disagreement from the first, however, with regard to the measure of loyalty to the king, and in 1643, when Massachusetts had asserted her claim to this region and the other three New Hampshire towns had submitted to her jurisdiction, the majority of the inhabitants of Exeter also yielded, while the minority, including the founder, remained loyal to the king. In 1689 the town became a part of the newly created province of New Hampshire. During the French and Indian wars it was usually protected by a garrison, and some of the garrison houses are still standing. From 1776 to 1784 the state legislature usually met at Exeter.

See C. H. Bell, History of the Town of Exeter (Exeter, 1888).

**EXETER BOOK** [Codex Exoniensis], an anthology of Anglo-Saxon poetry presented to Exeter cathedral by Leofric, bishop of Exeter, England, from 1050 to 1071, and still in the possession of the dean and chapter. It contains some legal documents, the poems entitled *Crist, Guthlac, Phoenix, Juliana, The Wanderer* and others, and concludes with between eighty and ninety riddles. It was first described in Humphrey Wansley’s *Catalogue of MSS.* at Oxford, with many inaccuracies, subsequently by J. J. Conybeare, Account of a Saxon Manuscript (a paper read in 1812; printed with some extracts from the MS. in Archaeologia, vol. xviii. pp. 180-107, 1814). A complete transcript made (1831) by Robert Chambers is in the British Museum (Addit. MS. 9067). It was first printed in 1842 by Benjamin Thorpe for the Soc. of Antiq. London, as Codex Exoniensis... with an English Translation, Notes and Indexes. More recent editions, chiefly based on Thorpe’s text, arc—In Chr. Grein’s Bibliothek der A.S. Poesie (vol. iii. part 1, ed. R. Wülker, Leipzig, 1897, with a bibliography), J. Schumacher in Philologus, xli. pp. 127-138 (1896), and C. H. Gellert, The Exeter Book, pt. i. (1895) with English translation, for the Early English Text Society.

A detailed account, with bibliographies of the separate poems, is given by R. Wülker, in Grundriss... der A.S. Literatur, pp. 218-236 (Leipzig, 1885); see also the introduction to the *Crist of Cyanwelh*, edited by Prof. A. S. Cook, with introduction, notes and a glossary (Boston, U.S.A., 1900). For the poems contained in the MS. see also Cyanwelh and Riddles.

**EXHIBITION**, a term, meaning in general a public display, which has a special modern sense as applied to public shows of goods for the promotion of trade (Fr. exposition). The first exhibition in this sense of which there is any account, in either sacred or profane history, was that held by King Alcmenarius, who according to Book 9 of the *Ethics*, was in the third year of his reign “the riches of his glorious kingdom, and the honour of his excellent majesty, many days, even a hundred and four-score days.” The locale of this function was Shushan, the palace and the exhibits consisted of “white, green and blue hangings, fastened with cords of fine linen and purple to silver rings and pillars of marble: the beds were of gold and silver, upon a pavement of red, and blue, and white and black marble. And they gave them drink in vessels of gold, the vessels being diverse one from another.” The first exhibition since the Christian era was at Venice during the dogeship of Lorenzo Tiepolo, in 1689. On that occasion there was a grand display, consisting of a water fête, a procession of the trades and an industrial exhibition. The various guilds of the Queen City of the Seas marched through the narrow streets to the great square of St. Mark, and their leaders asked the dogesara to inspect the products of their industry. Other medieval exhibitions were the fairs held at Leipzig and Nizhni Novgorod in Europe, at Tanta in Egypt, and in 1689 that by the Dutch at Leiden.

The modern exhibition was held at London in 1756 by the Society of Arts, which offered prizes for improvements in the manufacture of tapestry, carpets and porcelain, the exhibits being placed side by side. Five years afterwards, in 1761, the same society gave an exhibition of agricultural machinery. In 1797 a collective display of the art factories of France, including those of Sèvres, the Gobelins and the Savonnerie, was made in the palace of St. Cloud, and the exhibition was repeated during the following year in the rue de Varennes, Paris. This experiment was so successful that in the last three days of the same year an exhibition, under official auspices, at which private exhibitors were allowed to compete, was held in the Champ de Mars. Four years later, in 1801, there was a second official exhibition in the grand court of the Louvre. Upon that occasion juries of practical men examined the objects shown, and the winners of a gold medal were invited to dine with Napoleon, who was at that time First Consul. In the report of the jury the following remarkable sentence appeared:—“There is not an artist or inventor who, once obtaining thus a public recognition of his ability, has not found his reputation and his business regularly increased.” The Paris Exhibition, held in 1822, was the first to publish an official catalogue. The Exeter exhibitors, including J. E. Montgolfier, the first aëronaut, and J. M. Jacquard, the inventor of the loom which bears his name. The fourth exhibition was held in 1856 in the esplanade in front of the Hôtel des Invalides, and attracted 142,222 exhibitors. There were no more exhibitions till after the fall of the empire, but in 1819 the fifth was held during the reign of Louis XVIII., with 16,022 exhibitors. Others were held at Paris at various intervals, in which 1849 having 43,000 exhibitors.

Other exhibitions, though on a smaller scale, were held in Dublin, London, and in various parts of Germany and Austria during the first half of the 19th century—that in 1844, held at Berlin, having 3,040 exhibitors. Switzerland, Holland, Belgium, Sweden, Russia, Poland, Italy, Spain and Portugal all held exhibitions, and there was a Free Trade Bazaar of British Manufactures at Covent Garden theatre in 1845, which at the time created a great deal of interest. But all these exhibitions were confined to the products of the country in which they took place, and the first great International Exhibition was held in London in 1851 by the Society of Arts, under the presidency of the prince consort. All nations were invited to take part; and an exhibition building 20 acres in extent was erected, after the design of Sir Joseph Paxton, at a cost of £193,168. The exhibition was open for five months and fifteen days. The receipts amounted to £66,100, and the surplus was £18,600. The number of visitors was 6,939,105, and the money taken at the doors was £423,792. The total number of exhibitions was 13,937, of which Great Britain contributed 6861, the British colonies 520 and foreign countries 6536. The International Exhibition of 1851 was followed by those of New York and Dublin in 1853, Melbourne and Munich in 1854, and Paris in 1855—this latter was held in the Palais d’Industry, which remained in existence until pulled down to make room for the two Palais des Beaux Arts, which formed one of the attractions of the 1900 exhibition. The exhibitors numbered 20,830 and the visitors 5,162,330. There were national exhibitions during the following years in several European countries, but the next great world’s fair was held at London in 1862. The total space roofed in amounted to 988,000 sq. ft., 22,63 acres, the number of visitors was 6,11,103, and the amount received at the doors £408,350. The death of the prince consort had a depressing effect upon the enterprise. Invited to take part were London, in Hyde Park, and the greater proportion of the funds being supplied by Sir Benjamin Lee Guinness. The number of attendances during six months was 900,000, and the exhibition was opened at night. An Italian exhibition was held at Rome in 1862.

The Paris Exhibition of 1867 was upon a far larger scale than that of 1855. It was held, like those that preceded and succeeded it, at the Champ de Mars, and covered 41 acres. The building resembled an exaggerated gasometer. The external ring was
devoted to machinery, the internal to the gradual development of civilization, commencing with the stone age and continuing to the present era. A great feature of the exhibition was the park, which was studded with specimens of every style of modern architecture—Turkish mosques, Swedish cottages, English lighthouses, Egyptian palaces and Swiss chalets. The number of attendances was 6,855,969. The exhibitors numbered 43,217, and the total amount received for entrances, concessions, &c., was £420,735. This was the first exhibition at which there were international restaurants. The cost of the exhibition was defrayed partly by the state and partly by private subscriptions, and the proceeds held in the banks of Europe between 1867 and 1870, and in the latter year a series of international exhibitions, confined to one or two special descriptions of produce or manufactures, was inaugurated in London at South Kensington. These continued till 1874, but they failed to attract any very large attendance of the public and were abandoned.

A medal was given to each exhibitor, and reports on the various exhibits were published, but there was no examination of the exhibits by jurors. In 1873 there was an International Exhibition at Vienna. The main building, a rotunda, was erected in the Exposition Park, Paris, the Austrian captors having filled half of the space, more, the largest being that devoted to the exhibits of the various departments of the United States government, which covered 7 acres. Several novelties in exhibition management were introduced at Philadelphia. Instead of gold, silver and bronze medals, only one description, bronze, was issued, the difference between the merits of the different exhibits being shown by the reports. Season tickets were not issued, and the price of admission, the same on all occasions, was half a dollar, or about 2s. rd. The exhibition was not open at night or on Sundays, thus following the British, and not the continental, precedent. The number of visitors was 8,925,625, of whom 8,004,214 paid for admission, the balance being exhibitors, officials and attendants. The total receipts amounted to £763,859. Upon one occasion, the Pennsylvania day, 274,919 persons—the largest number that had visited any exhibition up to that date—passed through the turnstiles. The display of machinery was the finest ever made, that of the United States occupying 480,000 sq. ft. The motive-power was obtained from a Corliss engine of 1600 horse-power. At this exhibition the United Kingdom and the British Colonies of Canada, Victoria, New South Wales, New Zealand, Cape Colony and Tasmania made a very fine display, which was only excelled by that of the United States.

The Paris Exhibition of 1878 was upon a far larger scale in every respect than any which had been previously held in any part of the world. The total area covered not less than 66 acres, the main building in the Champ de Mars occupying 54 acres. The French exhibits filled one-half the entire space, the remaining moiety being occupied by the other nations of the world.
took part in the exhibition, but there was no official representation of the mother country. Exhibitions on somewhat similar lines were held at Nice and Calcutta in the winter of 1883 and 1884, and at Antwerp in 1895.

Several of the exhibitions, under the presidency of the then Prince of Wales, and managed by Sir Cunliffe Owen, was commenced at South Kensington in 1884. The first was devoted to a display of the various industries connected with fishing; the second, in 1884, to objects connected with hygiene; the third, in 1885, to inventions; and the fourth, in 1886, to the British colonies and India. These exhibitions attracted a large number of visitors and realized a substantial profit. They might have been continued indefinitely if it had not been that the buildings in which the last were held were ill-apprized, and that the surplus made by them was required for other purposes. There was no examination of the exhibits by juries, but a tolerably liberal supply of instrumental music was supplied by military and civil bands. The Crystal Palace held a successful International Exhibition in 1884, and there was an Italian Exhibition at Turin, and a Forestry Exhibition at Edinburgh, during the same year. A World's Industrial Fair was held at New Orleans in 1884-1885, and there were universal Exhibitions at Montenegro and Antwerp in 1885, at Edinburgh in 1886, Liverpool, Adelaide, Newcastle and Manchester in 1887, and at Glasgow, Barcelona and Brussels in 1888. The Melbourne International Exhibition in 1888-1889 to celebrate the Centenary of Australia. Great Britain, Germany, France, Austria and the United States were officially represented, and an expenditure of £237,784 was incurred by the local government.

The Paris Exhibition of 1889 marked an important change in the policy which had previously characterized the management of these gatherings. The funds were contributed partly by the state, which voted 17,000,000 francs, and by the municipality of Paris, which gave 8,000,000. A guarantee fund amounting to 23,124,000 francs was raised, and on this security a sum of 18,000,000 francs was obtained and paid into the coffers of the administration. The bankers who advanced this sum recouped themselves by the issue of 1,000,000 "bons," each of 25 francs. Every bon contained 25 admissions, valued at 1 franc, and certain privileges in the shape of participation in a lottery, the grand prix being 50,000. The calculations of the promoters were tolerably accurate. The attendances reached the then unprecedented number of 32,350,297, of whom 25,598,600 paid in entrance tickets and 2,723,366 entered by season tickets. A sum of 2,307,999 francs was obtained by concessions for restaurants and "sidel-shows," upon which the administration relied for much of the attractiveness of the exhibition. The total expenditure was 44,000,000 francs, and there was a small surplus. The space covered in the Champ de Mars, the Trocadero, the Palais d'Industrie, the Invalides and the Quai d'Orsay was 72 acres, as compared with 66 acres in 1878 and 41 acres in 1867. Amongst the novelties was the Eiffel Tower, 1000 ft. in height, and a faithful reproduction of a street in Cairo. The system of international juries was continued, but instead of gold, silver and copper medals, diplomas of various merits were granted, each entitling the holder to a uniform medal of bronze. Some of the nations, which had proved their artistic and commercial success, did not add to the dignity of the exhibition. The date at which it was held, the Centenary of the French Revolution, did not commend it to several European governments. Austria, Hungary, Belgium, China, Egypt, Spain, Great Britain, Italy, Luxembourg, Holland, Peru, Portugal, Rumania and Russia took part, but not officially, while Germany, Sweden, Turkey and Montenegro were conspicuous by their absence. On the other hand, Argentina, Bolivia, Chile, the United States, Greece, Guatemala, Morocco, Mexico, Nicaragua, Norway, Paraguay, Salvador, the South African Republic, Switzerland, Uruguay and Venezuela sent commissioners, who were accredited to the government of the French Republic. The total number of exhibitors was 61,722, of which France contributed 35,037, and the rest of the world 27,785. The British and colonial section was under the management of the Society of Arts, which obtained a guarantee fund of £16,800, and, in order to recoup itself for its expenditure, made a charge to exhibitors of 2s. per sq. ft. for the space occupied. There were altogether 1,140 British exhibitors, of whom 429 were in the Fine Arts section. One of the features of the exhibition was the number of congresses and conferences held in connexion with it.

During the year 1890 there was a Mining Exhibition at the Crystal Palace, and a Military Exhibition in the grounds of Chelsea Hospital; in 1891 a Naval Exhibition at Chelsea and an International at Jamaica. In 1891-1892 there were exhibitions at Palermo and at Launceston in Tasmania; in 1892, a Naval Exhibition at Liverpool, and one of Electrical Appliances at the Crystal Palace. A series of small national exhibitions under private management was held at Earl's Court between 1887 and 1891. The first of the series was that of the United States—Italy followed in 1888, Spain in 1889, France in 1890 and Germany in 1891.

The next exhibition of the first order of magnitude was at Chicago in 1893, and was held in celebration of the 400th anniversary of the discovery of America by Columbus. The financial arrangements were undertaken by a company, with a capital of £2,000,000. The central government at Washington allotted £50,000 for the purposes of foreign exhibits, and £500,000 for the erection and administration of a building for exhibits from the various government departments. The exhibition was held at Jackson Park, a place for public recreation, 580 acres in extent, situated on the shore of Lake Michigan, on the southern side of the city, with which it was connected by railways and tramways. Special provision was made for locomotion in the grounds themselves by a continuous travelling platform and an elevated electric railway. The proximity of the lake, and of some artificial canals which had been constructed, rendered possible the service of electric and steam launches. The exhibition remained open from the 1st of May to the 30th of October, and was visited by 21,477,112 persons, each of whom paid half a dollar (5s. 6d. or 25. rd.) for admission. The largest number of visitors on any one day was 716,881. In addition to its direct vote of £320,000, Congress granted £500,000 for the exhibition in a special coinage, which sold at an enhanced price. The receipts from admissions were £2,120,000; from concessions, £750,000; and the miscellaneous receipts, £159,000: total, £3,029,000. The total expenses were £5,222,000. Of the sums raised by the Company, £400,000 was returned to the subscribers. Speaking roughly, it may be said that the total outlay on the Chicago Exhibition was six millions sterling, of which three millions were earned by the financial operations of the company, whereas the other three million was earned by the United States government. The sums expended by the participating foreign governments were estimated at £1,440,000. The total area occupied by buildings at Chicago was as nearly as possible 200 acres, the largest building, that devoted to manufactures, being 1687 ft. by 787, and 30-5 acres. The funds for the British commission, which was under the control of the Society of Arts, were provided by the imperial government, which granted £60,000. The number of British exhibitors was 2236, of whom 597 were Industrial, 501 Fine Arts and 1138 Women's Work. The buildings were entirely under government control. The space occupied by Great Britain was 306,285 sq. ft.; and, in addition, separate buildings were erected in the grounds. These were Victoria House, the headquarters of the British commission; the Indian Pavilion, erected by the Indian Tea Association; the Kiosk of the White Star Steamship Company; and the structure set up by the Maxim-Nordenfeldt Company. Canada and New South Wales had separate buildings, which covered 100,140 and 50,051 sq. ft. respectively; and Cape Colony occupied 5220, Ceylon 27,574, British Guiana 3307, Jamaica 4150, Trinidad 3400 and India 3584 sq. ft. in the several buildings. The total space occupied by the British Colonies was therefore 103,660 sq. ft. The system of awards was considered extremely unsatisfactory. Instead of international juries, a single judge was appointed for each class, and the recompenses were all of one grade, a bronze medal and a diploma, on which was stated the reasons which induced the
EXHIBITION

judge to make his decision. Some judges took a high standard, and refused to make awards except to a small proportion of selected exhibits; others took a low one, and gave awards indiscriminately. About 1183 awards were made to British exhibitors. The French refused to accept any awards. The value of the British goods exhibited was estimated, exclusive of Fine Arts, at £450,000, and the expenses of showing them at £40,000. A large expenditure was incurred in the erection of buildings, which were more remarkable for their beauty and grandeur than for their suitableness to the purposes for which they were intended. Considerable areas were devoted to "side-shows," and the Midway Plaisance, as it was termed, resembled a gigantic fair. Every country in the world contributed something. There were sights and shows of every sort from everywhere. The foreign countries represented were Argentina, Austria, Belgium, Bolivia, Brazil, Bulgaria, Chile, Colombia, Costa Rica, Cuba, Curagao, Denmark, Danish West Indies, Ecuador, France, Germany, Greece, Guatemala, Honduras, Japan, Japan, Jodore, Korea, Liberia, Mexico, Monaco, Netherlands, Norway, Orange Free State, Paraguay, Persia, Portugal, Russia, Siam, Spain, Sweden, Turkey, United Kingdom and Colonies, Uruguay and Venezuela.

Exhibitions were held at Antwerp, Madrid and Bucharest in 1894; Hobart in 1894-1895; Bordeaux, 1895; Nizhni Novgorod, Berlin and Buda-Pest in 1896; Brussels and Brisbane in 1897. A series of exhibitions, under the management of the London Exhibition Company, commenced at Earl's Court in 1899 and continued in successive years.

The Paris Exhibition of 1900 was larger than any which had been previously held in Europe. The buildings did not cover so much ground as those at Chicago, but many of those at Paris had two or more floors. In addition to the localities occupied in 1889, additional space was obtained at the Champs Elysées, the park of Vincennes, on the north bank of the Seine between the Place de la Concorde, and at the Trocadero. The total superficial area occupied was as follows: Champ de Mars, 124 acres; Esplanade des Invalides, 30 acres; Trocadero Gardens, 40 acres; Champs Elysées, 37 acres; quays on left bank of Seine, 13 acres; quays on right bank of Seine, 23 acres; park at Vincennes, 256 acres; total, 549 acres. The space occupied by buildings and covered in amounted to 4,865,328 sq. ft., 1113 acres. The French section covered 2,691,000 sq. ft., the foreign 1,829,880, and those at the park of Vincennes 344,448 sq. ft. About one hundred French and seventy-five foreign pavilions and detached buildings were erected in the grounds in addition to the thirty-six official pavilions, which were for the most part along the Quai d'Orsay. Funds were raised upon the same system as that adopted in 1889. The French government granted 500,000, and a similar sum was contributed by the municipality of Paris. The total cost of building was raised by the issue of 3,350,000 "bons," each of the value of 20 francs, and containing 20 tickets of admission to the exhibition of the face value of one franc each, and a document which gave its holder a right either to a reduced rate for admission to the different "side-shows" or else to a diminution in the railway fare to and from Paris, together with a participation in the prizes, amounting to six million francs, drawn at a series of lotteries. Permission to erect restaurants, and to open places of amusement in buildings erected for that purpose, were sold at high prices, and for these privileges, which only realised 2,307,099 francs in 1889, the concessionaire was required to pay 10 per cent of the proceeds. The results did not justify the expectations which had been formed, and the administration finally consented to receive a much smaller sum. The administration calculated that they would have 65,000,000 paying visitors, though there were only 13,000,000 in 1878 and 25,398,699 in 1886. A very few weeks after the opening day, April 1st, it became evident that the estimated figures would not be reached, since a large number of holders of "bons" threw them on the market, and the selling price of an admission ticket declined from the par value of one franc to less than half that amount, or from 30 to 50 centimes. The proprietors of the restaurants and "side-shows" discovered that they had paid too much for their concessions, that the buildings they had erected were far too handsome and costly to be profitable, and that the public preferred the exhibition itself to the so-called attractions. The exhibition was largely visited by foreigners, but various causes kept away many persons of wealth and position. Although many speculators were ruined, the exhibition itself was successful. The attendance was unprecedentedly large, and during the seven months the exhibition was open, 39,000,000 persons paid for admission with 47,000,000 tickets, since from two to five tickets were demanded at certain times of the day and on certain occasions. The entries of exhibitors, attendants and officials totalled 9,000,000. The receipts were 114,456,213 francs (£4,578,249), and the expenditure 116,500,000 (£4,660,000), leaving a deficiency of rather more than two million francs (£50,000). It was calculated that the expenditure of the foreign nations which took part in the exhibition was six millions sterling, and of the French exhibitors and concessionnaires three millions sterling.

A new plan of classifying exhibits was adopted at Paris, all being displayed according to their nature, and not according to their country of origin, as had been the system at previous exhibitions. One-half the space in each group was allotted to France, so that the exhibitors of that nation were enabled to overwhelm their rivals by the number and magnitude of the objects displayed by them. All the agricultural implements, whatever their nationality, were in one place, all the ceramics in another, so that there was no exclusively British and no exclusively German court. The only exception to this rule was in the Trocadero, where the American, Australian, Argentinian, Brazilian, Chilean, and South American colonies, Algeria, Tunis, Siberia, the South African Republic, China and Japan were allowed to erect at their own cost separate pavilions. The greater number of the nationalities represented had palaces of their own in the rue des Nations along the Quai d'Orsay, in which thoroughfare were to be seen the buildings erected by Italy, Turkey, the United States, Denmark, Portugal, Austria, Bosnia, Herzegovina, Peru, Hungary, the United Kingdom, Persia, Belgium, Norway, Luxembourg, Finland, Germany, Spain, Bulgaria, Monaco, Sweden, Rumania, Greece, Servia and Mexico. Scattered about the grounds, in addition to those in the Trocadero, were the buildings of San Marino, Morocco, Ecuador and Korea. Nearly every civilized country in the world was represented at the exhibition, the most conspicuous absentees being Argentina, Brazil, Chile, and some other South and Central American Republics, and a number of the British colonies. The most noteworthy attractions of the exhibition were the magnificent effects produced by electricity in the palace devoted to it in the Château d'Eau and in the Hall of Illusions, the two palaces of the Fine Arts in the Champs Elysées, and the Bridge over the Seine dedicated to the memory of Alexander II. These permanent Fine Art palaces were devoted, the one to modern painting and sculpture, the other to the works of French artists and art workmen who flourished from the dawn of French art up to the end of the 18th century.

The United Kingdom was well but not largely represented both in Fine Arts and Manufactures, the administration of the section being in the hands of a royal commission, presided over by the prince of Wales. The British pavilion contained an important collection of paintings of the British school, chiefly by Reynolds, Gainsborough and their contemporaries, and by Turner and Burne-Jones. Special buildings had been erected by the British colonies and by British India. Canada, West Australia and Mauritius occupied the former, India and Ceylon the latter. For the first time since the war of 1870 Germany took part in a French International Exhibition, and the exhibits showed the great industrial progress which had been made since the foundation of the empire in 1871. The United States made a fine display, and fairly divided the honours with Germany. Remarkable progress was manifested in the exhibits of Canada and Hungary. France maintained her superiority in all the objects in which good taste was the first consideration, but the more utilitarian exhibits were more remarkable for their number than
EXHUMATION—EXILE

their quality, except those connected with electrical work and display, automobiles and iron-work. The number of exhibitors in the industrial section from the British empire, including India and the colonies, was 1,250, who obtained 1,647 awards, as many persons exhibited in several classes. There were, in addition, 465 awards for "collaborateurs," that is, assistants, engineers, foremen, craftsmen and workmen who had co-operated in the production of the exhibits. In the British Fine Arts section there were 429 exhibits by 262 exhibitors and 175 awards.

In later years, important international exhibitions have been held at Glasgow (1886) and at Buffalo, New York, in 1901, at St. Louis (co-operating the Louisiana purchase in 1904, at Liège in 1905, at Milan in 1906, at Dublin in 1907, and in London (Franco-British), 1908. In the artistic and taste significance of those buildings and the interest of their exhibits these took their cue from the great Paris Exhibition, and even in some cases went beyond it, notably at Buffalo (q.v.), St Louis (q.v.) and London. And it might well be thought that the evolution of this type of public show had reached its limits.

(G. C. L.)

EXHUMATION (from Med. Lat. exhumarre, ex, out of, and humus, ground), the act of digging up and removing an object from the ground. The word is particularly applied to the removal of a dead body from its place of burial. For the offence of exhuming a body without legal authority, and the process of obtaining such authority, see BURIAL AND BURIAL ACTS.

EXILARCH, in Jewish history, "Chief or Prince of the Captivity." The Jews of Babylonia, after the fall of the first temple, were termed by Jeremiah and Ezekiel the people of the "Exile." Hence the head of the Babylonian Jews was the exilarch (in Aramaic Rešh Galuša). The office was hereditary and carried with it considerable power. Some traditions regarded the last king of Davidic descent (Jehoiakim) as the first exilarch, and all the later holders of the dignity claimed to be scions of the royal house of Judah. Under the Arsacids and Sassanids the office continued. In the 6th century an attempt was made to secure by force political autonomy for the Jews, but the exilarch who led the movement (Mar Zutra) was executed. For some time thereafter the office was in abeyance, but under Arabic rule there was a considerable revival of its dignity. From the middle of the 7th till the 11th centuries the exilarchs were all descendents of Bostenai, through whom "the splendour of the office was renewed and its political position made secure" (Bacher). The last exilarch of importance was David, son of Zakki; he committed various notorious crimes. Hezekiah (c. 1040) was the last Babylonian exilarch, though the title left its traces in later ages. Benjamin of Tudela (Itinerary, p. 61) names an exilarch Daniel b. Hidsai in the 12th century. Petajia (Travels, p. 17) records that this Daniel's nephew succeeded to the office jointly with a R. Samuel. The latter, according to Petajia, had a learned daughter who "gave instruction, through a window, remaining in the house while the disciples were below, unable to see her.

Our chief knowledge of the position and function of the exilarch concerns the period beginning with the Arabic rule in Persia (722). In the preceding period the proconsul of the exilarch was noted for the stately retinue that accompanied him, the luxurious banquets given at his abode, and the courtly etiquette that prevailed there. A brilliant account has come down of the ceremonies at the installation of a new exilarch. Homage was paid to him by the rabbinical heads of the colleges (each of whom was called Gaon, q.v.); rich gifts were presented; he visited the synagogue in state, where a costly canopy had been erected over his seat. The exilarch then delivered a discourse, and in the benediction or doxology (ḥaddish) his name was inserted. Thereafter he never left his house except in a carriage of state and in the company of a large retinue. He would frequently have audiences of the king, by whom he was graciously received. He derived a revenue from taxes which he was empowered to exact. The exilarch could communicate, and no doubt had considerable jurisdiction over the Jews. A spirited description of the glories of the exilarch is given in D'Israeli's novel Abiy.

EXILE (Lat. exsilium or exilium, from exsil or exil, which is derived from ex, out of, and the root sal, to go, seen in salire, to leap, consul, &c.; the connexion with solum, soil, country is now generally considered wrong), banishment from one's native country by the compulsion of authority. In a general sense exile is applied to prolonged absence from one's country either through force of circumstances or when undergone voluntarily. Among the Greeks, in the Homeric age, banishment (φυγή) was sometimes inflicted as a punishment by the authorities for crimes affecting the general interests, but is chiefly known in connexion with cases of homicide. With these the state had nothing to do; the punishment of the murderer was the duty and privilege of the relatives of the murdered man. Unless the relatives could be induced to accept a money payment by way of compensation (σοφη, wergeld; see especially Homer, Iliad, xviii. 497), in which case the murderer was allowed to remain in the country, his only means of escaping punishment was flight to some foreign land. If his self under compulsion expressed their willingness to accept the indemnity, he was at liberty to return and resume his position in society.

In later times banishment is (1) a legal punishment for particular offences; (2) voluntary.

1. Banishment for life with confiscation of property was inflicted upon those who destroyed or uprooted the sacred olives at Athens; upon those who remained neutral during a sedition (by a law of Solon, which subsequently fell into abeyance); upon those who gave refuge to or received on board ship a man who had fled to avoid punishment; upon those who wounded with intent to kill and those who promised them to such an act (it is uncertain whether in this case exile was for life or temporary); upon any one who wilfully murdered an alien; for impiety. Certain political crimes also were similarly punished—treason, lese-majesty, sycophancy (see SCYPHANT), attempts to subvert existing decrees. For the peculiar form of banishment called OSTRACISM, see separate article.

In cases of voluntary homicide the punishment was death; but (except in cases of parricide) the murderer could leave the country unmolested after the first day of the trial. He was bound to remain outside Attica, and when on foreign soil was not allowed to appear at the public games, to enter the temples or take part in sacrifices; but provided that he adhered to the prescribed regulations, he was accorded a certain amount of protection. Even when a general amnesty was proclaimed, he was not allowed to return; if he did so, he might at once be put to death.

Temporary exile (the period of which is uncertain) without confiscation, was the punishment for involuntary homicide. As soon as the relatives of the deceased became reconciled to the man who had slain him, the latter was permitted to return; further, since banishment was only temporary, it is reasonable to suppose that the law insisted upon such reconciliation.

2. Citizens sometimes voluntarily left the country for other reasons (debt, inability to pay a fine). Since extradition was only demanded in cases of high treason or other serious offences against the state, the fugitive was not interfered with. He was at liberty to return after a certain time had elapsed.

Little is known about exile as it affected Sparta and other Greek towns, but it is probable that the same conditions prevailed as at Athens.

At Rome, in early times, exile was not a punishment, but rather a means of escaping punishment. Before judgment had been finally pronounced it was open to any Roman citizen condemned to death to escape the penalty by voluntary exile (solum vortere exsilii causa). To prevent his return, he was interdicted from the use of fire and water; if he broke the interdict and returned, any one had the right to put him to death. The aquae et ignis (to which et tecti "shelter" is sometimes added) interdictio is variously explained as exclusion from the necessary of life,
from the symbols of civic communion, or from "the marks of a pure society, which the criminal would defile by his further use of them." Subsequently (probably at the time of the Gracchi) it became a recognized legal penalty, practically equivalent to "exile," taking the place of capital punishment. The criminal was permitted to withdraw from the city after sentence was pronounced; but in order that this withdrawal might not be possible he was characterized as a punishment, which departure was sanctioned by a decree of the people which declared his exile permanent. Authorities are not agreed whether this exile by interdiction entailed loss of civilitas; according to some this did not ensue until (in earlier times) the criminal had assumed the citizenship of the state in which he had taken refuge and thereby lost his rights as a citizen of Rome, while others hold that it was not until the time of Tiberius (A.D. 23) that capitis deminutio media became the direct consequence of trial and conviction. Interdictio was the punishment for treason, murder, arson and other serious offences which came under the cognizance of the questions perpetue (permanent judicial commissions for certain offences); confiscation of property was only inflicted in extreme cases.

Under the Empire interdictio gradually fell into disuse and a new form of banishment, introduced by Augustus, called deportatio, generally in insulam, took its place. For some time the two probably existed side by side. Deportatio consisted in transportation for life to an island (or some place prescribed on the mainland, not of Italy), accompanied by loss of civilitas and all civil rights, and confiscation of property. The most dreaded places of exile were the islands of Cyurus, Sardinia, an oasis in the desert (quarir in insulis of Libya Caece. Cyprus and Rhodes were considered more tolerable. Large bodies of persons were also transported in this manner; thus Tiberius sent 4000 freedmen to Sardinia for Jewish or Egyptian superstitious practices. Deportatio was originally inflicted upon political criminals, but in course of time became more particularly a means of removing those whose wealth and popularity rendered them objects of suspicion. It was also a punishment for the following offences: adultery, murder, poisoning, forgery, embezzlement, sacrilege and certain cases of immorality.

Relegatio was a milder form of deportatio. It either excluded the person banished from one specified district only, with permission to choose a residence elsewhere, or the place of exile was fixed. Relegatio could be either temporary or for life, but it did not in either case carry with it loss of civilitas or property, nor was the exile under military surveillance, as in the case of deportatio. Thus, Ovid, when in exile at Tomi, says (Tristia, v. 11): "he (i.e. the emperor) has not deprived me of life, nor of wealth, nor of the rights of a citizen . . . he has simply ordered me to leave my home." He calls himself relegatus, not exsil.

In later writers the word exsilium is used in the sense of all its three forms—aquæ et ignis interdictio, deportatio and relegatio.

In England the first enactment legalizing banishment dates from the reign of Elizabeth (39 Eliz. c. 4), which gave power to banish from the realm "such rogues as are dangerous to the inferior people." A statute of Charles II. (18 Car. II. c. 3) gave power to execute or to transport to America for life the mosstropers of Cumberland and Northumberland. Banishment or transportation for criminal offences was regulated by an act of 1824 (5 Geo. IV. s. 84) and finally abolished by the Penal Servitude Acts 1853 and 1857 (see further DEPORTATION). The word exile has sometimes, though wrongly, been applied to the sending away not of criminals or of persons condemned to be killed, but only of those who may be temporary or even permanent residents in it (see also EXPATRIATION; EXPULSION).

EXILL, an Italian chemist and poisoner in the 17th century. His real name was probably Nicolò Egidi or Eggido. Few authentic details of his life exist. Tradition, however, credits him with having been originally the salaried poisoner at Rome of Olympia Maidalchina, the mistress of Pope Innocent X. Subsequently he became a gentleman in waiting to Queen Christina of Sweden, whose taste for chemistry may have influenced this appointment. In 1609, his presence in France aroused the suspicions of the French government, which in 1610 imprisoned him at the Bastille. Here he is said to have made the acquaintance of Godin de Sainte-Croix, the lover of the marquise de Brin- villiers (q.v.). After three months' imprisonment, powerful influences secured Exill's release, and he left France for England.

EXMOOR FOREST, a high moorland in Somersetshire and Devonshire, England. The uplands of this district are bounded by the low alluvial plain of Sedgemoor on the east, by the lower basin of the Exe on the south, by the basin of the Taw (in part) on the west, and by the Bristol Channel on the north. The area thus defined, however, includes not only Exmoor but the Brendon and Quantock Hills east of it. Excluding these, the total area in the district lying at an elevation exceeding 1000 ft. is about 120 sq. m. The geological formation is Devonian. The ancient forest had an area of about 20,000 acres, and was enclosed in 1815. Large tracts are still uncultivated; and the wild red deer and native Exmoor pony are characteristic of the district. The highest point is Dunkery Beacon in the east (1707 ft.), but Span Head in the south-west is 1618 ft., and a height of 1300 ft. is attained at several points. The Exe, Barle, Lyn and other streams, traversing deep pictureque valleys except in their uppermost courses, are in favour with trout fishermen. The few villages, such as Exford, Withypool and Simonsbath, with Lynton and Lynmouth on the coast, afford centres for tourists and sportsmen. Exmoor is noted for its stag hunting. The district has a further fame through Richard Blackmore's novel, Lorna Doone.

EXMOUTH, EDWARD PELLEW, 1ST VISCOUNT (1752-1833), English admiral, was descended from a family which came originally from Normandy, but had for many centuries been settled in the west of Cornwall. He was born at Dozmary, on the 19th of April 1757. At the age of thirteen he entered the navy, and even then his smartness and activity, his feats of daring, and his spirit of resolute independence awakened remark, and pointed him out as one specially fitted to distinguish himself in his profession. He had, however, no opportunity of active service till 1776, when, at the battle of Lake Champlain, his gallantry, promptitude and skill, not only saved the "Carleton"—whose command had devolved upon him during the progress of the battle—from imminent danger, but enabled her to take a prominent part in sinking two of the enemy's ships. For his services on this occasion he obtained a lieutenant's commission, and the command of the schooner in which he had so bravely done his duty. The following year, in command of a brigade of seamen, he shared in the hardships and perils of the American campaign of General Burgoyne. In 1782, in command of the "Pelican," he attacked three French privateers inside the Île de Batz, and compelled them to run themselves on shore—a feat for which he was rewarded by the rank of post-captain. On the outbreak of the French War in 1793, he was appointed to the "Nymph," a frigate of 36 guns; and, notwithstanding the loss which she sustained, he forced her, by a desperate conflict, the French frigate "La Cleopâtre," a vessel of equal strength. For this act he obtained the honour of knighthood. In 1794 he received the command of the "Arethusa" (38), and in a fight with the French frigate squadron off the Île de Batz he compelled the "Pomona" (44) to surrender. The same year the western squadron was increased and its command divided, the second squadron being given to Sir Edward Pellew in the "Indefatigable" (44). While in command of this squadron he, on several occasions, performed acts of great personal daring;
and for his bravery in boarding the wrecked transport "Dutton," and his promptitude and resolution in adopting measures so as to save the lives of all on board, he was in 1796 created a baronet. In 1798 he joined the channel fleet, and in command of the "Impéducteurs" (74) took part in several actions with great distinction. In 1802 Sir Edward Pelow was elected member of parliament for Dunstable, and during the time that he sat in the Commons he was a strenuous supporter of Pitt. In 1804 he was made rear-admiral of the blue, and appointed commander-in-chief in India, where, by his vigilance and rapidity of movement, he entirely cleared the seas of French cruisers, and secured complete protection to English commerce. He returned to England in 1809, and in 1810 was appointed commander-in-chief in the North Sea, and in 1811 commander-in-chief in the Mediterranean. In 1814 he was created Baron Exmouth of Canonteign, and in the following year was made K.C.B., and a little later G.C.B. When the day of Algiers, in 1816, violated the treaty for the abolition of slavery, Exmouth was directed to attack the town. Accordingly, on the 26th of August, he engaged the Algerine battery and fleet, and after a severe action of nine hours' duration, he set on fire the arsenal and every vessel of the enemy's fleet, and shattered the sea defences into ruins. At the close of the action the defeat apologized for his conduct, and agreed to a renewal of the treaty, at the same time delivering up over three thousand persons of various nationalities who had been Algerine slaves. For this naval victory, Exmouth was advanced to, the dignity of viscount. Shortly before his death, which took place on the 23rd of January 1833, he was made vice-admiral.

He had married Susan (d. 1837), daughter of James Frowde of Knoyle, Wiltshire, who bore him four sons and two daughters. His eldest son, Ponnwell Bastard Pelow (1786-1833), became 2nd Viscount Exmouth, and his descendant, Edward Addington Hargreaves Pelow (b. 1890), became the 5th viscount in 1890.

Exmouth's second son, Sir Fleetwood Broughton Reynolds Pelow (1789-1861), was like his father an admiral. The third son was George Pelow (1793-1856), author and divine, who married Frances (d. 1876), daughter of the prime minister, Lord Sidmouth, and wrote his father-in-law's life (The Life and Correspondence of Henry Addington, 1st Viscount Sidmouth, 1847).

Exmouth had a brother, Sir Israel Pelow (1758-1832), also an admiral, who was present at the battle of Trafalgar.

A Life of the 1st viscount, by Edward Oster, was published in 1835.

EXMOUTH, a market-town, seaport and watering-place in the Honiton parliamentary division of Devonshire, England, at the mouth of the river Exe, 103 m. S.E. by S. of Exeter by the London & South-Western railway. Pop. of urban district (1901) 5,050. In modern times Exmouth has developed into a primitive summer fishing village at the base of Beacon Hill, a height commanding fine views over the estuary and the English Channel. After its more modern terraces were built up the hillside, Exmouth became the first seaside resort in Devon. Its excellent bathing and the beauty of its coast and moorland scenery attract many visitors in summer, while it is frequented in winter by sufferers from pulmonary disease. The climate is unusually mild, as a range of hills shelters the town on the east. A promenade runs along the sea wall; there are golf links and public gardens, and the port is a large modern yachting centre, a rendezvous for yachtsmen. Near the town is a natural harbour called the Little. The local industries include fishing, brick-making and the manufacture of Honiton lace. Exmouth was early a place of importance, and in 1347 contributed 10 vessels to the fleet sent to attack Calais. It once possessed a fort or "castelet," designed to command the estuary of the Exe. This fort, which was garrisoned for the king during the Civil War, was blockaded and captured by Colonel Shapecoate in 1646.

EXODUS, BOOK OF, in the Bible, a book of the Old Testament, which gives its name, through the Greek, from the event which forms its opening. It narrates, viz., the deliverance of Israel from Egypt. Strictly speaking, however, this title is applicable to the first half only, the historical portion of the book, and takes no account of those chapters which describe the giving of the Law on Mt. Sinai, nor of those which deal with the Tabernacle and its furniture. By the Jews it is usually styled after its opening words (וַיֹּאמֶר יְהֹוָה KJV / בִּנְכָרָה אֵלֵי יִשְׂרָאֵל לֵאמָר "וַיִּצְאֶהוּ מִמָּשֶּרֶךְ לְמֹשֶׁה KJV") or, more briefly, הָשֹׁרֶךְ (שֹׁרֶךְ) or, more briefly, הָשָׁרֶךְ (שָׁרֶךְ).

In its present form the book sets forth (a) the oppression of the Israelites in Egypt (ch. i.), (b) the birth and education of Moses, and his flight to the land of Midian (ch. ii.), (c) the theophany at Mt. Horeb (the Burning Bush), and the subsequent commission of Moses and Aaron (iii. 1–iv. 17), (d) the return of Moses to Egypt, and his appeal to Pharaoh which results in the further oppression of Israel (iv. 18–vii. 7), (e) the plagues of Egypt (viii. 8–x. 10), (f) the institution of the Passover and the Feast of Unleavened Cakes, the last plague, and Israel's departure from Egypt (xii. 1–xiii. 16), (g) the crossing of the Red Sea and the discomfiture of the Egyptians, the Song of Triumph, the sending of the manna and other incidents of the journeying through the wilderness (xiii. 17–xviii. 27), (h) the giving of the Law, including the Decalogue and the so-called Book of the Covenant, on Sinai-Horeb (xix.–xxi.), (i) directions for the building of the Tabernacle and for the consecration of the priests (xxv.–xxvi.), (j) the sin of the Golden Calf, and another earlier version of the first legislation (xxxi.–xxxiv.), (k) the construction of the Tabernacle and its erection (xxxv.–xl.).

The book of Exodus, however, like the other books of the Hexateuch, is a composite work which has passed, so to speak, through many editions; hence the order of events given above cannot lay claim to any higher authority than that of the latest editor. Moreover, the documents from which the book has been compiled belong to different periods in the history of Israel, and each of them, admittedly, reflects the standpoint of the age in which it was written. Hence it follows that the contents of the book are not of equal historical value; and though the claim of a passage to be considered historical is not necessarily determined by the age of the source from which it is derived, yet, in view of the known practice of Hebrew writers, greater weight naturally attaches to the earlier documents in those cases in which the sources of the two strands are united, than in the case of a late at variance with one of the others. Above all, therefore, if the actual course of history must be preceded by an inquiry into the source of the various contents of the book.

The sources from which the book of Exodus has been compiled are the same as those which form the basis of the book of Genesis, while the method of composition is very similar. Here, too, the strongly marked characteristics of P, or the Priestly Document, as opposed to JE, enable us to determine the extent of that document with comparative ease; but the absence, in some cases, of conclusive criteria prevents any final judgment as to the exact limits of the two strands which have been united in the hands of the two editors. As shown above, in the case of JE. The important question is, therefore, whether the sources of the legislative portions of the book: in the historical sections the separation of the two sources gives rise to fewer difficulties. It does not, however, lie within the scope of the present article to examine the various sources underlying the narrative with any minuteness, but rather to sum up those results of modern criticism which have been generally accepted by Old Testament scholars.

To this end it will be convenient to treat the subject-matter of the book under three main heads: (a) the historical portion (ch. i.–xviii.,) (b) the sections dealing with the giving of the Law, (xix.–xxi.), and (c) the construction of the Tabernacle and its furniture (xxxv.–xxxvi.).

(a) Israel in Egypt and the Exodus (ch. i.–xviii.). (i) i. 1–vii. 13. —The analysis of these chapters shows that the history, in the main, has been derived from the two sources J and E, chiefly the former, and that a later editor has interposed certain passages from P, besides introducing a slight alteration of the original order and other re-structural changes. The combined narrative of JE sets forth the rise of a new king in Egypt, who endeavoured to check the growing strength of the children of Israel; the birth of Moses, his early life in Egypt, his flight to Midian and marriage with Zipporah, the theophany at Mt. Horeb, and his divine commission to deliver Israel from Egypt.

At the very outset, indeed, JE has taken care to portray their divergent origin and point of view. According to J (i. 6, 8, 12, 20) the Israelites dwell apart in the province of Goshen, and their numbers become so great as to call for severe measures of repression: the method employed being that of forced labour. E, on the other hand (i. 15–20),

the parallel narrative of J, though it is impossible to determine the
exact point at which J's account is introduced: certainly ii. 156-22

narrative of the call of Moses is by no
traces of twofold origin (J iii.
2-40, 5, 7, 8, 16-18; iv. 1-12 (13-16), 29-31; E iii. I, 46, 6, 9-14,
21, 22; iv. 17, 18, 206, 27, 28). These two sources present striking
points of difference, which reappear in the subsequent narrative.
According to E, Moses with Aaron is to demand from Pharaoh the
release of Israel, which will be effected in spite of his opposition
in assurance thereof the promise is given that they shall serve God
upon this mountain; moreover, the people on their departure are
to borrow raiment and jewels from their Egyptian neighbours.
According to J, on the other hand, the spokesmen are to be Moses
and the elders; and their request is for a temporary departure only,
viz. "three days' journey into the wilderness"; their departure
from Egypt is a hurried one. Yet another difficulty, which disappears as soon as the composite character of the narrative is recognized, is that of the signs. In J three signs are given for the purpose
of reassuring Moses, only one of which is wrought with the rod (iv.
1-9), but in iv. 17 (E) the reference is clearly to entirely different
of Egypt, which according to E were
signs, probably the plagues
"
the rod of God." Further, it is questioninvariably wrought by
able if the passage iv. 13-16 really forms part of the original narrative
of J, and is not rather to be ascribed to the redactor of JE. The
name of Aaron has certainly been introduced by a later hand in J's
account of the plague of frogs (viii. 12), and the only passage in J
in which Aaron is represented as taking an active part is iv. 29-31,
where the mention of his name causes no little difficulty. 2 In E,
on the other hand, Aaron is sent by God to meet Moses at Mt.
Horeb, after the latter had taken leave of Jethro, and, later on,
of Pharaoh.
The succeeding
accompanies him into the presence
narrative (v. I-vi. l) is mainly taken from J, though E's account

into the wilderness to sacrifice to Yahweh, a request which is met by
an increase of the burdensome work of brick-making: henceforward
the Israelites have to provide their own straw. The people complain
Yahweh and is assured by him
bitterly to Moses, who appeals to
"
of the future deliverance of Israel
by a strong hand."
With the exception of the genealogical list (i. 1-5) and the brief
notices of the increase of Israel (i. 7) and of its oppression at the
hands of the Egyptians (i. 13, 14; ii. 236-25), the narrative so far
But in vi. 2-yii. 13 we are confronted
exhibits no traces of P 3
with a narrative which carries us back to ii. 236-25 and gives practically a parallel account to that of JE in ch. iii.-y. Thus the revelation
of the divine name, vi. 2 f., finds its counterpart in iii. lof., the message
to be delivered to Israel (vi. 6 f .) is very similar to that of ch. iii. 16 f .,
while the demand which is to be addressed to Pharaoh is identical

speak of one son being born to Moses at" this period, a statement
in iv. 20 is obviously a
which is borne out by iv. 20, 25 (" sons
correction), whereas ch. xviii. (E) mentions two sons.
The original order of events in J seems to have been as follows:
after the -death of Pharaoh (ii. 230; the Septuagint repeats this
notice before iv. 19) Moses returns to Egypt with his wife and son
On the way he is
(iv. 19, 20) in obedience to Yahweh's command.
seized with a sudden illness, which Zipporah attributes to the fact
that he has not been circumcised and seeks to avert by circumcising
her son (iv. 24-26). The scene of the theophany, therefore, according
to J, is to be placed on the way from Midian to Goshen. Probably
the displacement of iv. 19, 20, 24-26 is due to the editor of JE, who
was thus enabled to combine the two narratives of the theophany.
*
Cf. iv. 30; Aaron had received no command to do the signs,

with that which had been already refused in ch. v. No allusion,
however, is made by Moses to this previous demand; he merely
urges the same objection as that put forward in iv. lof. With the
4
his objection,
resumption of the story in vi. 28 f." Moses reiterates
and is told that Aaron shall be his prophet " and speak for him,
and shall also perform the sign of the rod (cf. iv. 2-4). The sign,
however, has no effect on Pharaoh (vii. 13), and we thus reach the
same point in the narrative as at vi. i. Apart from the literary
characteristics which clearly differentiate this narrative from the
preceding accounts of J and E. the following points of variation are
worthy of consideration: (i) The people refuse to listen to Moses;
(2) Aaron is appointed to be Moses' spokesman, not with the people,
but with Pharaoh; (3) one sign is given (not three) and performed
before Pharaoh; (4) the rod is turned into a reptile (tannin), not a
serpent (nahash).

First Plagues of Egypt.
In this section the
main sources, which are clearly marked
both by their linguistic features and by their

analysis again reveals three
off

from one another

difference of representation. The principal source is J, from which
are derived six plagues, viz. killing of the fish in the river (vii. 14,
16, 170, 18, 2la, 24, 25), frogs (viii. 1-4, 8-150), insects (viii. 20-32),
murrain (ix. 1-7), hail (ix. 13-18, 236, 246, 256-34), locusts (x. 10,
3-1 1, 136, 146, 150, c-19, 24-26, 28, 29), the threat to slay all the
first-born (xi. 4-8). The most striking characteristic of this narrative
is that the plagues are represented as mainly due to natural causes
and follow a natural sequence. Thus Yahweh smites the river so
that the fish die and render the water undrinkable. This is succeeded by a plague of frogs. The swarms of flies and insects, which
next appear, are the natural outcome of the decaying masses of
frogs, and these, in turn, would form a natural medium for the
spread of cattle disease. Destructive hailstorms, again, though rare,

are not unknown in Egypt, while the locusts are definitely stated
to have been brought by a strong east wind. Other distinctive
features of J's narrative are: (i) Moses alone is bidden to interview
Pharaoh (vii. 14 f. viii. I f., 20 f. ix. I f., 13 f. x. I f.); (2) on
each occasion he makes a formal demand; (3) on Pharaoh's refusal
the plague is announced, and takes place at a fixed time without any
human intervention; (4) when the plague is sent, Pharaoh sends for
Moses and entreats his intercession, promising in most cases to
accede in part to his request; when the plague is removed, however,
the promise is left unfulfilled, the standing phrase being " and

plagues
in Goshen. E's account (water turned into blood, vii. 15, 176, 206,
23; hail, ix. 22, 230, 240, 250, 35; locusts, x. 12, 130, 140, 156)
is more fragmentary, having been doubtless superseded in most cases
by the fuller and more graphic narrative of J, but the plague of
in this source. As contrasted
darkness (x. 20-23, 2 7) is found
only
with J the narrative emphasizes the miraculous character of the
"
the rod of God," which
plagues.

and Pharaoh's heart was strong (pin)," or "and
Yahweh made strong (p'tn) Pharaoh's heart " and " he would not
let the children of Israel (or, them) go."
In the priestly narrative
(P) the plagues assume the form of a trial of skill between Aaron,
who acts at Moses' command, and the Egyptian magicians, and thus
connect with vii. 8-13. The magicians succeed in turning the Nile
water into blood (vii. 19, 200, 216, 22), and in bringing up frogs
(viii. 5-7), but they fail to bring forth lice (viii. 156-19), and are
themselves smitten with boils (ix. 8-12): the two last-named plagues
have no parallel either in J or E. Throughout the P sections
Aaron is associated with Moses, and the regular command given to
the latter is "Say unto Aaron": no demand is ever made to
of the plague is quite short.

phenomena of a composite narrative, viz. repetitions and inconsistencies. Thus J's regulations for the Passover (xii. 21-23, 276) seem
at first sight simply to repeat the commands given to Moses and
Aaron in xii. 1-13 (P), but in reality they are a parallel and divergent
account. In TO. 1-13 the choice of the lamb and the manner in
which it is to be eaten constitute the essential feature, the smearing
with the blood being quite secondary; in TO. 21 f. the latter point
is all-important, and no regulations are given for the paschal meal
(which, possibly, formed no part of J's original account). Similarly
the institution of the Feast of Mazzoth, or Unleavened Cakes (xiii.
3-ioJ), does not form the sequel to the regulations laid down in xii.

further description of the striding of the people for water at Meribah that the double name Massah—Meribah arose, xvii. 16-7 (iα belongs to P), though Deut. xxxiii. 8 makes it clear that Massah and Meribah were used interchangeably (v. 8). This B-text is introduced as a young man and Moses' minister; and (c) the references elsewhere to the home of the Amalekites: according to Num. xiii. 29, xiv. 25, xlv. 30, they dwelt in the S. W. S. of Judah near Caleb's and the Saron 29. 30, xliv. 10-19.

Ch. xvi. is the visit of Jethro to Moses and the appointment of judges.

—This story, like the preceding one, is mainly derived from E and is only partly derived from J. Liberation from the land and the ministry of the priests and Levites is in the chapter itself point unmistakably to a time just before the departure from Egypt. Neither of these contents makes it confirmed both by Deut. i. 9-16 and by the parallel account of J in Num. x. 29-32. The narrative, however, displays signs of compounding, and it is not impossible that E has incorporated in it several historical units. These have to be considered in their respective positions, and it can be stated that the book of Exodus, may be briefly analysed as follows. In ch. xvi. we have a twofold description of the theophany on Mt. Sinai (or Horeb) followed by the marriage of Miriam and the first account of the wilderness accounts. 1. The four subdivisions of the code we find, each dealing in part with the civil and social (xxii. 2-xxiii. 17), in part with the religious life of Israel, the so-called Book of the Covenant, xx. 22—xxiii. 19. Ch. xxiv. contains a complete expository treatment of the Sinai covenant, and it is clear that Moses and Aaron, and xxvii, and xxviii. we have again two narratives of the sin of the people and of Moses' intercession, while in ch. xxix., we are confronted with yet another early code, which is practically identical with the religious enactments of xxviii. 20-xxix. 30. In ch. xxxii. 1-10, With but few exceptions the presence of the individual sections may be said to have been finally determined by the labours of the critics. It is not even a certainty that the book of Exodus was written as a whole. It is evident that the sequence of events, which they now present, cannot be original, but is rather the outcome of a long process of revision, during which the text has suffered considerably from alterations, sometimes with the result that the same event is reported by two or even three narratives. In so far as the composition employed by Hebrew editors, or revisors, is possible in this case, as in others, not only to determine the source of each individual passage, but also to trace with considerable confidence the various stages in the process by which it reached its final form and position. It must, however, be admitted that the evidence at our disposal is, in some cases, capable of more than one interpretation. Hence a final conclusion can hardly be expected, but with certain modifications in detail the following solution of the problem may be accepted as representing the point of view of recent criticism. Ch. xix. contains two parallel accounts of the theophany on Horeb, of ch. xx., one of which is derived from E, and one from P. According to the former, Moses is instructed by God (Elohim) to sanctify the people against the third day (v. 90), and to prepare their articles to depart. According to the latter, Moses and Aaron and the priests are summoned to the top of the mountain (v. 26), and the command of God is given through Moses. It is clear that the two accounts clearly present the same scene, but with different purposes. In ch. xx. the primary purpose is to introduce the religious ceremonies. In ch. xxi, the primary purpose is to introduce the institution of the civil and religious official. The two accounts thus serve different ends, and the parallelism is to be explained on this basis.

XI.

The crossing of the Red Sea. —According to J the children of Israel departed from Egypt under the guidance of Yahweh and in the sea to the land of Canaan (cf. Num. xii. 13). For the Israelites this was a pillar of fire (xxi. 22). On hearing of their flight Pharaoh at once sets in pursuit. The Israelites, terrified by the approach of the Egyptian army, is the story adds, they went to the hand of Yahweh (xxiv. 5, 7, 10a, 11-14, 19b). Yahweh then causes a strong east wind to blow all night, which drives back the waters from the shallows, and so renders it possible for the host of Egypt to cross over. The Egyptians follow, but the story says that their chariots are hindered by the soft sand, and in the morning they are caught by the returning waters (xivv. 21b, 24, 25, 27b, 28b, 30). The story, however, has been combined with the somewhat different account derived from E (or J), according to which the crossing of the Red Sea was accomplished by the descent of a dark cloud and the darkness itself. Thus presupposing that the crossing took place by day, and that the dark cloud which divided the two hosts was miraculously caused by the angel of Yahweh. E also represents the sea as divided by means of Moses' rod, but heightens the effect by describing the crossing as a taking place between walls of water (xix. 20; xivv. 1-4, 8, 9, 15b, 16-18, 21a, c, 22, 23, 25b, 27a, 28a, 29a). According to E, Moses probably does not extend beyond xv. 1, and has its counterpart in the very similar song of Miriam (E), in vv. 20, 21. The rest of the song (vv. 2-18) is probably the work of a later writer; for these verses set forth not only the deliverance from Egypt, but also the events of the subsequent experiences and further presuppose the existence of the temple (v. 13b, 17b). These phenomena have been explained as due to later expansion, but the poem has all the appearance of being a unity, and the language, style and rhythm all point to a later age. Verse 19 is probably the work of the redactor (R'P) who inserted the song.

(5) xv. 22-xvii. 27. Incidents in the Wilderness. —The narrative of the first journeying in the wilderness (xv. 22-xvii. 7) presents a series of difficulties which probably owe their origin to the editorial activity of R', who appears to have transformed the beginning of the wilderness a number of incidents which rightly belong to the end of the departure from Egypt, from E, and have been inserted in the middle of the narrative. The sweetening of the waters of Marah, with which has been incorporated a fragment of E's story of Massah (xv. 25b) and a Deuteronomist expansion in v. 26. These are followed by the present section of the same name and quals. In its present form, this narrative contains a number of conflicting elements, which can only be the result of editorial activity. Thus vv. 6, 7 must originally have preceded vv. 11, 12, though the redactor has attempted to evade the difficulty by inserting v. 8. Again, the account of the quails, which is obviously incomplete, is undoubtedly derived from Num. xi.; but the latter account, which admittedly belongs to E, places the incident at the end of the wanderings. Closer examination also shows that the manna shows that its true position is after the departure from Mt. Sinai; cf. the expressions used in vv. 9, 10, 33, 34, implying the existence of the ark and the tabernacle. The account of the manna, however, can hardly have stood originally in close juxtaposition with his account of the quails (cf. Num. xi. 6), but the two narratives were probably combined by R' before they were transferred to their present position. The account of the quails in v. 8 (and possibly vv. 17, 18) by way of explanation, and vv. 5 and 22-30, which imply that the law of the Sabbath was already known, and introduce a fresh element into the story. A plausible explanation of this is that the redactor had an earlier account of the giving of the manna already existing at this point of the narrative. We know from Deuteronomy viii. 2, 16 that JE considers the giving of the manna as a part of the work of Moses not to be attributed to the hand of Yahweh. The desire of the narrator to prove the theophany and the people 's desire of the manna were incorporated into the work of Yahweh, and the manna already existed at this point of the narrative. We know from Deuteronomy viii. 2, 16 that JE considers the giving of the manna as a part of the work of Moses. The story of the manna is presented in the narrative of the manna and the quails, viz. xv. 25b; xiv. 4, 15, 16b, 19b-21. These verses must be assigned to E, for in xv. 3, 26 (where they do not appear) the juev (xv. 25b). The verse has presumably been taken out of its place, and the verses have been incorporated into the final account (xv. 3, 26), and the verse has been added at the end of the verse (xv. 3, 26), and the verse has been added at the end of the verse (xv. 3, 26), and the verse has been added at the end of the verse (xv. 3, 26), and the verse has been added at the end of the verse (xv. 3, 26).
now generally admitted that the words and the judgments (which are missing in c. 1 b) have been inserted in xxiv. 36 by the redactor of whom E's narrative is given in ch. xxxiv, which describes how Moses hewed two tables of stone at Yahweh's command, and went up to the top of the mountain, where he received the words of the covenant and wrote them on the tablets. As a result, Moses, in the chapter concerning which it contains as a renewal of a former, covenant, also written on tables of stone, which had been broken (16, 48). But the document itself, as 'gotten at Sinaï', shows, a new or at least more recent, form, while the previous references to tables of stone and to Moses' breaking them belong to the parallel narrative of E. Moreover, the covenant, which was set forth (v. 10 f.), is clearly a new one, and contains no hint of the pre-existing pre-existing legislation, nor of any breach of it by the people. In view of these facts we are forced to conclude that 16 ("like unto the first...brakest"), 48 ("and he hewed...the first") and v. 11-15 (formed no part of the original narrative, but were inserted by a later Deuteronomic redactor) of this edition of the Decalogue alone formed the basis of the covenant at Sinai-Horeb, and in order to retain J's version, he represented it as a renewal of the tables of stone which Moses had broken.

The legislation contained in xxxiv. 10-26, which may be described as the oldest legal code of the Hexateuch, is almost entirely religious. It prohibits the making of molten images (v. 17), the use of leaven in sacrifices (25b), and the setting of a kid in its mother's milk (26b), and enjoins the observance of the three annual feasts and the Sabbath (18-22). In a brief indication of the birth-sixth (19, 20), derived from xiii. 11-13 and of the first-fruits (26b).

The parallel collection of E is preserved in xx. 24-26, xxiii. 10-19, to which we should probably add xxii. 29-31 (for which xxiii. 190 was the source). After the parallels we pass to a distinct and another so closely, both in form and extent, that they can only be referred to different collections, a paragraph of J, and preserved as two versions of the same kind. E has, however, preserved certain additional regulations with regard to the building of altars (xx. 24-26) and the observance of the seventh day (10, 11), and omits the prohibition of molten images (xx. 22, 23, appear to be the work of a redactor). xxiii. 20-33, the promises attached to the observance of the Sabbath in the form of the covenant, probably formed no part of the original code, but were added by the Deuteronomic redactor; cf. especially vv. 23-25a, 27, 28, 31b-33. The narrative of E relative to the delivery of these laws has disappeared, but xxiv. 3-8 is a parallel collection which is preserved, and which (in the context) clearly point back to some such narrative. These verses describe how Moses wrote all the words of the Lord in a book and read them to the people (v. 7) as the basis of a covenant, which was completed by the sprinkling of the blood of the accompanying sacrifices.

In the existing text the covenant laws of E (xx. 24-26, xxiii. 29-31, xxii. 10-19) are combined with a mass of civil and other legislation, hence the title "Book of the Covenant" (referred to above of the form which has usually been applied to the whole section, xx. 22-xxiii. 33). But this section includes three distinct elements: (a) the "words ("the honor") mentioned in the narratives (Moses and the people, "the words of the covenant"), xx. 2-xxii. 17, and (b) a group of moral and ethical enactments, xxii. 18-28, xxiii. 1-9, and an examination of their contents makes it evident that, though the last two groups are unconnected with the covenant enacted by E, they have not been transferred from Deuteronomic to E's narrative. This original "Book of the Covenant"; for the "judgments," which are expressed in a hypothetical form, consist of a number of legal details which, when combined, form the result. It falls into five divisions: (1) The rights of slaves, xx. 11-12; (2) capital offences, xxii. 12-16 (v. 17 has probably been added later); (3) injuries inflicted by man or beast, xxii. 18-32; (4) losses incurred by culpable negligence or theft, xxii. 33-xxiii. 6; (5) cases arising out of debts, loans, seduction, xxii. 7-17. It is obvious, from their very nature, that these legal precepts could not have been included in the covenant which the people (xxiv. 3) promised to observe, and it is implied that the covenant was always in force, even in the absence of the people, and (2) the intercession of Moses, of both of which a double account has been preserved.

1 Unless we follow Riedel and read simply "the worshipped" (\(\lambda\eta\rho\iota\mu\iota\nu\nu\iota\) instead of "and drank" (\(\alpha\theta\rho\iota\nu\nu\iota\); "treat" and "ate" (\(\alpha\theta\rho\iota\nu\nu\iota\)) as a later addition; cf. HDB, extra vol. p. 631 note.

2 v. 6-9 are out of place here: they belong to the story of Moses' intercession in ch. xxxiv.

3 This view is confirmed by a comparison of v. 19 ("and I will write") with vv. 27, 28: according to the latter, Moses wrote the words of the covenant; and (b) the tardy mention of Moses in 4b: he could not have been mentioned if the covenant was written at Sinai-Horeb.

4 Others suppose that the present position of ch. xxxiv. is due, in the first instance, to RJE, but in view of the other Deuteronomic evidence this must be regarded as improbable that if v. 3 was discordant by RJE inavour of E's, and was afterward restored by RD.

5 Reading the "sacrifice of my feasts" for the "sacrifice of the feast" of Passover.

6 Unless, with Bacon, we are to regard xxiv. 12-14, 18b as original. More probably a later editor has worked up old material of E (of which there are unmistakable traces) in order to include the whole of xx.-xxii. in the covenant: xxiv. 15-18b are an addition from E.
EXODUS

(1) The Sin of the People.—According to J (xxxi., 25-29) the people, during the absence of Moses, "break loose," i.e. mutiny. There is probably, however, no such strong reason for his removing his answer to his appeal the sons of Levi arm themselves and slay a number of the people: as a reward for their services they are bidden to consecrate themselves to Yahweh. The fragmentary form of the narrative (Ex. xxxi.) condenses the account of the "break loose"—is doubtless due to the latter editor, who substituted the story of the golden calf (xxxi., 1-6, 15-24, 35), according to which the sin is not a break loose, but deviation from the divine ordinance. 

At the instigation of the people Aaron makes a molten calf out of the golden ornaments brought from Egypt; Moses and Joshua, on their return to the camp, find the people holding festival in honour of the calf. Moses anger is considerable; he is already in his unapproachable aspect, which he carries: he then demolishes the golden calf, and administers a severe rebuke to Aaron. The punishment of the people is briefly recorded in r. 35. This latter narrative, which is obviously interpolated, is a reversion to the old law of intercession in ch. xxxii.; in any case, vv. 8 and 13 must be regarded as redactional.

(2) Aaron's Intercession.—The time for departure from the Sacred Mountain had now arrived, and Moses is accordingly bidden to lead the people to the promised land. Yahweh himself refuses to accompany Israel owing to their disobedience, but in response to Moses' passionate plea, he promises "... as a father pjausible of his son, so shall I be pjausible of the people which is in thee ..." (xxv., 1-3). The account of Moses' intercession has been preserved in J, though the narrative has undergone considerable dislocation. The true sequence of the narrative appears to be as follows: Moses is commanded to lead the people to Canaan (xxxi., 1-3); he pleads that he is unequal to the task (Num. xi. 10, 11, 12, 14, 15), and, presumably, asks for assistance, which is promised (omitted). Moses then asks for a fuller knowledge of Yahweh and his ways (xxxii., 13); this request also is granted (v. 17), and it is reiterated to pray that he may see the glory of Yahweh; Yahweh replies that his prayer can only be granted in part, for "man shall not see me live"; a partial revelation is then vouchsafed to Moses (xxxiii. 18-23, xxxiv. 6-8): finally, Moses beseeches Yahweh to go to the midst of his people, and is assured that Yahweh's presence shall accompany them (xxxiv. 9, xxxiii. 14-16). The passage from Numbers xi., which is here inserted, is obviously of place in its present context (the story of the quails), and supplies in part the necessary antecedent to Ex. xxxii., 12, 13; the passage is now separated from Ex. xxxii. by Ex. xxxiv. (1), which has been wrongly transferred to Ex. xxxiv. 17. Moses is bidden to enter into the midst of the people and to consecrate them. He is told to consecrate the people by the priestly legislation of Ex. xxxv.-xl., Leviticus and Num. i.-x.; but originally it must have stood in close connexion with that chapter. A similar dislocation of the narrative exists in Ex. xxxvi. 1-30, which clearly forms the sequel to xxxiii. 17-23. The latter passage, however, can hardly represent the conclusion of the interview, which is found more naturally in xxxiii. 14-16. E's account of Moses' intercession is the one which has been preserved in J, but the passage has probably been revised by a later hand; in any case its position before instead of after the dismissal would seem to be appropriate.

It is a plausible conjecture that the original narratives of J and E also contained directions for the construction of an ark; as a substitute for the personal presence of Yahweh, and also for the erection of a tent of meeting outside the camp, and that these commands were omitted by R in favour of the more elaborate instructions given in ch. xxxv.-xlvii. (P). The subsequent narrative of J (Num. xx. 16-26, xxxv. 44) implies an account of the making of the ark, while the narrative of E concerning the ark in Ex. xxv.-xxxvi. 9-29, in regard to the "tent of meeting" points no less clearly to some earlier statement as to the making of this tent.

On the completion of it its consecration Moses and the appointment of judges (ch. xxvii.), the departure from the mountain and the battle with Amalek (xxvii. 8-16).—It has long been recognized that the elaborate description of the Tabernacle and its furniture, and the accompanying directions for the dress and consecration of the priests, contained in ch. xxxii.-xxxix., is an expansion of the historical description of the Mosaic Tabernacle and its service. The language, style and contents of this section point unmistakably to the hand of P. The narrative, as we have just seen, is not an addition to the narratives of ch. xxxii.-xxxvi., but part of an ideal representation of the post-exilic ritual system, which has been transferred to the Mosaic age. According to this

1 According to Deut. x. 1 f., which is in the main a verbal excerpt from Ex. xxxiv. 1 f., Yahweh ordered Moses to make an ark of acacia wood before he ascended the mountain.

2 To the same hand are to be ascribed also xxvi. 6, 20, 21; xxxvii. 41; xxix. 21, 38-41.

EXODUS

home, and these, really of later origin, have thus been thrown back to the earlier period in order to give them the stamp of authority. So, although a certain amount of the narrative could date from the days of Moses, the Exodus story has been made the vehicle for the aims and ideals of subsequent ages, and has been adapted from time to time to the requirements of later stages of thought. The work of criticism has brought to light important examples of fluctuating tradition, singular lacunae in some places and unusual wealth of tradition in others, and has demonstrated that much of that which had long been felt to be impossible and incredible was due to writers of the post-exilic age many centuries after the presumed date of the events.

The book of Genesis closes with the migration of Jacob's family into Egypt to escape the famine in Canaan. Jacob died and was buried in Canaan by his sons, who, however, returned again to the promised which the Egyptian king had granted them in Goshen. Their brother Joseph had died-breathed promised that God would bring them to the land promised to their forefathers and solely adjoined them to carry up his bones (Gen. 1.)

In the book of Exodus the family has become a people. The Pharaoh is hostile, and Yahweh, the Israelite deity, is moved to send a deliverer; on the events that followed see Exodus, Book of Moses. It has been thought that dynastic changes occasioned the change in Egyptian policy (e.g. the expulsion of the Hyksos), but if the Israelites built Rameses and Pithom (Ex. 1. 11), cities which, as excavation has shown, belong to the 11th-12th centuries B.C., earlier dates are inadmissible. On these grounds the Exodus may have taken place under one of his successors, and since Merneptah or Merenptah (son of Rameses), in relating his successes in Palestine, boasts that Yisra'el is desolated, it would seem that the Israelites had already returned. On the other hand, it has been suggested that when Jacob and his family entered Egypt, some Israelite tribes had remained behind and that it is to these that Merneptah's inscription refers. The problem is complicated by the fact that, from the Egyptian evidence, not only was there at this time no remarkable emigration of the general population, but Biblical tribes were then receiving permission to enter Egypt and to feed their flocks upon Egyptian soil. It might be assumed that the Israelites (or at least those who had not remained behind in Palestine) effected their departure at a somewhat later date, and in the time of Merenptah's successor, Seti II., there is an Egyptian report of the pursuit of some fugitive slaves over the eastern frontier. The value of all such evidence will naturally depend largely upon the estimate formed of the biblical narratives, but is it necessary to observe that these have not yet found Egyptian testimony to support them? Although the information that has been brought to bear upon Egyptian life and customs substantiates the general accuracy of the local colouring in some of the biblical narratives, the latter contain several inherent improbabilities, and whatever future research may yield, no definite trace of Egyptian influence has so far been found in Israelite institutions.

No allusions to Israelites in Egypt have yet been found on the monuments; against the view that the Aperi (or Apur) of the inscriptions mentioned in D. L. Page, Authority and Archaeology, pp. 56 sqq.; H. W. Hogg, Encyc. Bib. col. 1310. The plagues of Egypt have been shown to be those to which the inscriptions allude (R. Thomes, Plagues of Egypt), but the description of the relations of Moses and Aaron to the court raises many difficult questions (H. F. Smith, O.T. Hist. pp. 57-60). Those who reject Ex. 1. 11 and hold that 480 years elapsed between the Exodus and the foundation of the temple (1 Kings xi., see BIBLE: Chronology) place the former about the time of Tethmosis (Thothmes III.), and suspect that the hostile Habir (Khabir) who troubled Palestine in the 13th century A.D. are no other than Hebrews (the Hyksos), is philosophically unsound. But although the evidence of the Amarna tablets might thus support the biblical tradition in its barest outlines, the view in question, if correct, would necessitate the rejection of a great mass of the biblical narratives on a wholly different basis.

In the absence of external evidence the study of the Exodus of Jewish sources must be based upon the Israelite records, and divergent or contradictory views must be carefully noticed. Regarded simply as a journey from Egypt into Palestine it is the most probable of occurrences: the difficulty arises from the actual narratives. The first stage is the escape from the land of Goshen (q.s.), the district allotted to the family of Jacob (Gen. xlvi. 28-34, xlvii. 1, 4, 6). As to the route taken across the Red Sea (Yam Sáf) scholars are not agreed (see W. M. Müller, Encyc. Bib. col. 1346 sqq.); it depends upon the view held regarding the second stage of the journey, the road to the mountain of Sinai or Horeb and thence to Kadesh. The last-mentioned place is identified with Ain Kadis, about 50 m. south of Beersheba; but the identification of the mountain is uncertain, and it is possible that tradition confused two distinct places. According to one favourite view, the journey was taken across the Sinaic peninsula to Midian, the home of Jethro. Others plead strongly for the traditional site Jebel Mūsā or Serbal in the south of the peninsula (see J. R. Harris, Dict. Bible, iv. pp. 536 sqq.; H. W. Winkler, Encyc. Bib. col. 4641). The latter view implies that the oppressed Israelites left Egypt for one of its dependencies, and both theories find only conjectural identifications in the various stages. The relations of events of forty years, corresponding to the years of wandering, is from a post-exilic source, and may be based merely upon a knowledge of caravan-routes; even if it be of older origin, it is of secondary value since it represents a tradition differing notably from that in the earlier narratives themselves, and these on inspection confirm Judg. xi. 16 sqq., where the Israelites proceed immediately to Kadesh.

Ex. xvi.-xviii. presuppose a settled encampment and a lawgiving, and thus belong to a stage after Sinai had been reached (Ex. xix. sqq.). They are closely related, as regards subject matter, &c., to the narratives in Num. x. 29-xx. 1-13 (Sinai to Kadesh), and the initial step is the recognition that the latter is their original context (see G. F. Moore, Encyc. Bib. col. 1443 [l.]). Further, internal peculiarities associating events now at Sinai-Horeb with those at Kadesh support the view that Kadesh was their true scene, and it is to be noticed that in Ex. xx. 22 sqq. the Israelites already reach the wilderness of Sin, and the references to Kadesh and Sinai, with their context (Gen. xiv. 7) was doubtless associated with traditions of the giving of statutes and ordinances. The detour to Sinai-Horeb appears to belong to a later stage of the tradition, and is connected with the introduction of laws and institutions of relatively later form. It is foreshadowed by the injunction to avoid the direct way into Palestine (see Ex. xiii. 17-19), since on reaching Kadesh the Israelites would be within reach of hostile tribes. The command which it was supposed to avoid actually ensued. 4 The forty years of wandering in the wilderness is characteristic of the Deuteronomic and post-exilic narratives (in the earlier sources the fruitful oases of Kadesh is the centre, and even after the tradition of a journey to Sinai-Horeb was developed, only a brief period is spent at the holy mountain.

From Kadesh spies were sent into Palestine, and when the people were dismayed at their tidings and incurred the wrath of Yahweh, the penalty of the forty years' delay was pronounced.

1 See, e.g., J. Orr, Problem of the O.T., pp. 422 sqq.; Ed. Meyer, Die Israeliten, pp. 222 sqq. Some, too, find in the Amarna tablets the historical background for Joseph's high position at the Egyptian court (see Cheyne, Encyc. Bib., art. 'Joseph').

EXOGAMY

(Num. xiii. seq.). Originally Caleb alone was exempt and for his faith received a blessing; later tradition adds Joshua and in Deut. i. 37 seq. alludes to some unknown offence of Moses. According to Num. xxi. 1-3 the Israelites (a generalizing amplification) captured Hormah, on the way to Beersheba, and subsequently the clan Caleb and the Kenites (the clan of Moses' father-in-law) are found in Judah (Judg. i. 109). Although the traditions regard their efforts as part of a common movement (from Gilgal, see below), it is more probable that these (notably Caleb) escaped the punishment which befell the rest of the Israelites, and made their way direct from Kadesh into the south of Palestine.1 On the other hand, according to the prevailing tradition, the attempt to break northwards was frustrated by a defeat at Hormah (Num. xiv. 40-43), an endeavour to pass Edom failed, and the people turned back to the Yam Sûgî (here at the head of the Gulf of Akabah) and proceeded up to the east of Edom and Moab. Conflicting views are represented (on which see Moab), but at length Shittim was reached and preparations were made to cross the Jordan into the promised land. This having been effected, Gilgal became the base for a series of operations in which the united tribes took part. But again the representations disagree, and to the overwhelming campaigns depicted in the book of Joshua most critics prefer the account of the more gradual process as related in the opening chapters of the book of Judges (see Jews: History, § 8).

Thus, whatever evidence may be supplied by archaeological research, the problem of the Exodus must always be studied in the light of the biblical narratives. That the religious life of post-exilic Israel was derived from remote periods cannot be maintained against the results of excavation or against the later history, nor can we picture a united people in the desert when subsequent vicissitudes represent the union as the work of many years, and show that it lasted for a short time only under David and Solomon. During the centuries in which the narratives were taking shape many profound changes occurred to affect the traditions. Developments associated with the Deuteronomistic reform and the reorganization of Judaism in post-exilic days can be unmistakably recognized, and it would be unsafe to assume that other vicissitudes have not also left their mark.

Allowance must be made for the shifting of boundaries or spheres of influence (Egypt, Edom, Moab), for the incorporation of tribes and of their own tribal traditions, and in particular for other movements (e.g. from Arabia).2 If certain clans moved direct from Kadesh into Judah, it is improbable that others made the lengthy detour from Kadesh by the Gulf of Akabah, but this may well be an attempt to fuse the traditions of two distinct migrations. Among the Joseph-tribes (Ephraim and Manasseh), the most important of Israelite divisions, the traditions of an ancestor who had lived and died in Egypt would be the more cherished possession, but although most writers agree that not all the tribes were in Egypt, it is impossible to determine their number with any certainty. At certain periods, intercourse with Egypt was especially intimate, and there is much in favour of the view that the name Mizräim (Egypt) extended beyond the borders of Egypt proper. Reference has already been made to other cases of geographical vagueness, and one must recognize that in a body of traditions such as this there was room for the inclusion of the most diverse elements which it is almost hopeless to separate, in view of the scantiness of relevant evidence from other sources, and the literary nature of the text.

That many different beliefs have influenced the tradition is apparent from what has been said above, and is especially noticeable from a study of the general features. Thus, although the Israelites possessed cattle (Ex. xvii. 3, xix. 13, xxiv. 5, xxxii. 6, xxxiv. 3; Num. xx. 19), allusion is made to their lack of meat in order to magnify the wonders of the journey, and among divinely sent aids to guide and direct the people upon the march not only does Moses require the assistance of a human helper (Jethro or Hobab), but the angel, the ark, the pillar of cloud and of fire and the mysterious hornet are also provided.

In addition to the references already given, see J. W. Colenso, Penitaneh and Book of Judges (on internal correspondence between Judges and Exodus) and Alle Test. im Lichte d. alt. Oriens (pp. 402 seq., on later references in Manetho, &c., with which cf. also R. H. Charles, Jubilees, p. 225 seq.); art. "Exod. in Ency. Bib.; Ed. Meyer, Israeliten (1909); Gestrich, Theologie des Alten Testaments in den historischen Schriften des Orients, part of the histories of Israel and commentaries on the book of Exodus. Among the numerous special works, mention may be made of G. Steuernagel, Das Buch Exodus (1907), and G. Palmer, Desert of the Exodus; O. A. Toft, The Historic Exodus (fuller than that given in L. B. Paton, Hist. of Syria and Palestine, p. 34 (also ch. viii.); and C. F. Kent, Beginnings of Heb. Hist. p. 355 seq. (S. A. C.)

EXOGAMY (Gr. ἕξω, outside; and γαμος, marriage), the term proposed by J. F. McLennan for the custom compelling marriage out of the tribe (2) or rather "out of the totem"; its converse is endogamy (q.v.). McLennan would find an explanation of exogamy in the prevalence of female infanticide, which, "rendering women scarce, led at once to polyandry within the tribe, and the capturing of women from without." Infanticide of girls is, and no doubt ever has been, a very common practice among savages, and for obvious reasons. Among tribes in a primitive stage of social organization girl-children must always have been a hindrance and a source of weakness. They had to be fed and yet they could not take part in the hunt for food, and they offered a temptation to neighbouring tribes. Infanticide, however, is not proved to have been so universal as McLennan suggests, and it is more probable that the reason of exogamy is not likely to be found in that primitive society. The fact of the "captured" woman the only wife in the modern sense of the term. In the beginnings of human society children were related only to their mother; and the women of a tribe were common property. Thus no man might appropriate any female or attempt to maintain proprietary rights over her. With women of other tribes it would be different, and a warrior who captured a woman would doubtless pass unchallenged in his claim to possess her absolutely. Infanticide, the evil physical effects of in-and-in breeding, the natural strength of the impulse to possess on the man's part, and the greater feeling of security and a tendency to family life and affections on the woman's part, would combine to make exogamy increase and marriages within the tribe decrease. A natural impulse would in a few generations tend to become a law or a custom, the violation of which would be looked on with horror. Physical capture, too, as soon as increasing civilization and tribal intercommunication removed the necessity for violence, became symbolic of the more permanent and individual relations of the sexes. An additional explanation of the prevalence of exogamy may be found in the natural tendency of exogamous tribes to increase in numbers and strength at the expense of those communities which moved towards decadence by in-breeding. Thus tradition would harden into a prejudice, strong as a principle of religion, and exogamy would become the inviolable custom it is found to be among many races. In Australia, Sir G. Grey writes: "One of the most remarkable facts connected with the natives is that they are divided into certain great families, all the members of which bear the same name... these families are common over a great portion of the continent and a man cannot marry a woman of his own family name. In eastern Australia, Sir R. Burton says: 'The Fijians will not marry within the same, or even of a consanguineous family,' and the Bakalakhins in the same rule. Paul B. de Chailli found exogamy the rule and blood marriages regarded as an abomination throughout western Equatorial Africa. In India the Khasias, Juangs, Waralis, Ooraos, Hos and other tribes are strictly exogamous. The Kalmucks are divided into hordes, and no man may marry a woman of the same horde. Circassians and Samoyedes have similar rules. The Ostlaks regard endogamy (marriage within the clan) as a crime, as do the Yakuts of Siberia. Among the Indians of America severe rules prescribing exogamy prevail. The Tsimshean Indians of British Columbia are divided into
tribes and totems, or "crests which are common to all the tribes," says one writer. "The crests are the whale, the porpoise, the eagle, the coon, the wolf and the frog. . . . The relationship existing between persons of the same crest is nearer than that between members of the same tribe. . . . Members of the same tribe may marry, but those of the same crest are not allowed to under any circumstances; that is, a whale may not marry a whale. . . . These associations are, moreover, associated with the Mayas of Yucatan and the Indians of Guiana are exogamous, observing a custom which is thus seen to exist throughout Africa, in Siberia, China, India, Polynesia and the Americas.

 EXORCISM (Gr. ἐξορίζω, to conjure out), the expulsion of evil spirits from persons or places by incantations, magical rites or other means. As a corollary of the animistic theory of diseases and of belief in Possession (q.t.), we find widely spread customs whose object is to get rid of the evil influen. These customs may take the form of a general expulsion of evils, either once a year or at irregular intervals; the evils, which are often regarded as spirits, sometimes as the souls of the dead, may be expelled, according to primitive philosophy, either immediately by spells, purifications or some form of coercion; or they may be put on the back of a scapegoat or other material vehicle. Among the means of expelling the evil spirits are the assaults with warlike weapons or sticks, the noise of musical instruments or of the human voice, the use of masks, the invocation of more powerful good spirits, &c.; both fire and water are used to drive them out, and the use of iron is a common means of holding them at bay.

The term exorcism is applied more especially to the freeing of an individual from a possessing or disease-causing spirit; the means adopted are frequently the same as those mentioned above; in the East Indies the sufferer sometimes dances round a small ship, into which the spirit passes and is then set adrift. The patient may be beaten or means may be employed whose efficiency depends largely on their suggestive nature. Among the Dakota Indians the medicine-man chants hi-le-li-lah at the bed of the sick man and accompanies his chant with the rattle; he then sucks at the affected part till the possessing spirit is supposed to come out and take its flight, when men fire guns at it from the door of the tent. The Zulus believe that they can get rid of the souls of the dead, which cause diseases, by sacrifices of cattle, or by expostulating with the spirits; so too the shaman or medicine-man in other parts of the world offers the possessing spirit objects or animals.

The professional exorcist was known among the Jews; in Greece the art was practised by women, and it is recorded that the mothers of Epicurus and Aeschesius belonged to this class; both were bitterly reproached, the one by the Stoics, the other by Demosthenes, with having taken part in the practices in question. The prominence of exorcism in the early ages of the Christian church appears from its frequent mention in the writings of the fathers, and by the 3rd century there was an order of exorcists (see EXORCIST). The ancient rite of exorcism in connexion with baptism is still retained in the Roman ritual, as is also a form of service for the exorcising of possessed persons. The exorcist signs the possessed person with the figure of the cross, desires him to kneel, and sprinkles him with holy water; after which the exorcist asks the devil his name, and accuses him by the holy mysteries of the Christian religion not to afflict the person possessed any more. Then, laying his right hand on the demoniac's head, he repeats the form of exorcism as follows: "I exorcise thee, unclean spirit, in the name of Jesus Christ; tremble, O Satan, thou enemy of the faith, thou foe of mankind, who hast brought death into the world, who hast deprived men of life, and hast rebelled against justice, thou seducer, thou root of evil, thou source of avarice, discord and envy." Houses and other places supposed to be haunted by unclean spirits are likewise to be exorcised with similar rites, and in general exorcism has a place in all the ceremonies for consecrating and blessing persons or things (see BENEDICTION).

W. Exorcismus; Waldseem, Autochronograph, p. 64; L. W. King, Bonaparte Magic; Murray, La Magie; R. Thompson, Devils and Evil Spirits of Babylonia.

EXORCIST (Lat. exorcista, Gr. ἔξοργάτης), in the Roman Catholic church, the third grade in the minor orders of the clergy, between those of acolyte and reader. The office, which involves the right of ceremonially exorcising devils (see EXORCISM), is actually no more than a preliminary stage of the priesthood. The earliest record of the special ordination of exorcists is the 24th canon of the Council of Carthage (A.D. 296). "When they are ordained," it runs, "they receive from the hand of the bishop a little book in which the exorcisms are written, receiving power to lay hands on the energumeni, whether baptized or catechumens." Whatever its present position, the office of exorcist was, until comparatively recent times, by no means considered a sinecure. "The exorcist a terror to demons" (Paulinus, Epist. 24) survived the Reformation among Protestants, with the belief, expressed by Firmilianus in his epistle to St. Cyprian, that through the exorcists, by the voice of man and the power of God, the devil may be whipped, and burnt and tortured.

EXOTIC (Gr. ξυπόξειος, of foreign, or belonging to another country). The term is now used in the restricted sense of something not indigenous or native, and is mostly applied to plants introduced from foreign countries, which have not become naturalized. Figuratively, "exotic" is used to convey the sense of something rare, delicate or extravagant.

EXPROLATION (from Late Lat. expatriare, to exile, and patria, native land), a term used in a general sense for the banishment of a person from his own country. In international law the term is applied to the renunciation or change of allegiance to one's native or adopted country. It may take place either by a voluntary act or by operation of law. Some countries, as France and England, disclaim their subjects if they become naturalized in another country, others, again, passively permit expatriation whether a new nationality has been acquired or not; others, as Germany, make expatriation the consequence of continued absence from their territory. (See ALIEN; ALLEGIANCE: NATURALIZATION.)

EXPERT (Lat. expertus, from experiri, to try), strictly, skilled, or one who has special knowledge; as used in law, an expert is a person who is expert in something, by profession, to a cause, to give his opinion on some point in issue with which he is peculiarly conversant. In Roman law questions of disputed handwriting were referred to experts; and in France, whenever the court considers that a report by experts is necessary, it is ordered by a judgment clearly setting forth the objects of the expertise (Code Proc. Civ. art. 302). Three experts are then to be appointed, unless the parties agree upon one only (art. 303). The experts are required to take an oath (art. 305), but in practice this requirement is frequently dispensed with. They may be challenged on the same grounds as witnesses (art. 310). The necessary documentary and other evidence is laid before them (art. 317), and they make a single report to the court, even if they express different opinions: in that case the grounds only of the different opinions are to be stated, and not the personal opinion of each of the experts (art. 318). If the court is not satisfied with the report, new experts may be appointed (art. 322); the judges are not bound to adopt the opinion of the experts (art. 323). "This procedure in regard to experts is common to both the civil and commercial courts, but it is much more frequently resorted to in the commercial court than in the civil court, and, in the former, it is usually conducted by special experts officially attached to each of these courts." (Bodington, French Law of Evidence, London, 1902, p. 102).
A similar system is to be found in force in many other European countries; see e.g. Codes of Civil Procedure of Holland, arts. 222 et seq.; Belgium, arts. 302 et seq.; Italy, arts. 252 et seq.; as well as in those colonies where French law has been followed (Codes of Civil Procedure of Quebec, arts. 392 et seq.; St Lucia, arts. 286 et seq.). In Mauritius the articles of the French law, summarized above, are still nominally in force; but in practice each side calls its own expert evidence, as in England.

There is some evidence that in England the courts were in early times in the habit of summoning to their assistance, apparently as assessors, persons specially trained to advise them in matters of scientific or technical question that required to be determined. Thus "in an appeal of malhemp (i.e. wounding) . . . the court did not know how to adjudge because the wound was new, and then the defendant took issue and prayed the court that the malhemp might be examined, on which a writ was sent to the sheriff to cause to come medicos chirurgios de melioribus London, ad informandum dominum regem et curiam de hae qua ex parte domini regis injungentur" (Year Book, 21 Hen. VII. pl. 30. p. 33). The practice of calling in expert assistance in judicial inquiries was not confined to medico-legal cases. "If mafacts are at issue,"人民法院 in Buckley v. Rice Thomas (1554, Plowden, 124 a), "which concern other faculties, we commonly apply for the aid of that science or faculty which it concerns." English procedure, however, being litigious, and not, like continental European procedure, inquisitorial, in its character, the expert soon became, and still is, simply a witness to speak to matters of opinion.

There is a considerable body of law in England as to expert evidence. Only a few points can be touched upon here. (1) An expert is permitted to refresh his memory in regard to any fact by referring to anything written by himself or under his direction at the time when the fact occurred or at a time when it was fresh in his memory. This is also law generally in the United States (see e.g. New York Civil Code, s. 1843). In Scotland, medical and other scientific reports are lodged in process before the trial, and the witness reads them as part of his evidence and is liable to be examined or cross-examined on their contents. (2) In strictness, an expert will not be allowed, in cases of alleged insanity, to say that a litigating or incriminated party is insane or the reverse, and so to usurp the prerogative of the court or jury. But he may be asked whether certain symptoms, as advanced in the cases, are typical of insanity. But in practice this rule is relaxed both in England and in Scotland, and (where it exists) to a still greater extent in America. (3) Foreign law can only be proved in English courts—and the same rule applies in Scotland—(a) by obtaining an opinion on the subject from a superior court of the country whose laws are in dispute under the Foreign Law Ascertaining Act 1861 or the British Law Ascertaining Act 1859, or (b) by the evidence of a lawyer of the country whose law is in question, or who has studied it in that country, or of an official whose position requires, and therefore possesses, a sufficient knowledge of that law. (4) The weight of authority both in England and in America supports the view that an expert is not bound to give evidence as to matters of opinion unless upon an undertaking by the party calling him to pay a reasonable remuneration for his evidence.

Statutory provision has been made in England for the summoning of expert assistance by the legal tribunals in various cases. In the county courts the judge may, if he thinks fit, on the application of either party, call in as assessor one or more persons of skill and experience as to the matters in dispute (County Courts Act 1888, s. 160), and special provision is made for calling in an assessor in employers' liability cases (act of 1856, s. 6) and admiralty matters (see County Courts Admiralty Jurisdiction Acts of 1868 and 1869). In the High Court and court of appeal one or more specially qualified assessors may be called in to assist in the hearing of any cause or matter except a criminal proceeding by the crown (Judicature Acts 1873, s. 59), and a like power is given to both these courts and the judicial committee of the privy council in patent cases (Patents, &c., Act 1883, s. 28). Maritime causes, whether original or on appeal from county courts, are usually taken in the presence of Elder Brethren of the Trinity House, who advise the judge without having any right to control or any responsibility for his decision (see the "Beryl," 1884, 9 P.D. 1), and on appeal in maritime causes nautical assessors are usually called in by the court of appeal, and may be called in by the House of Lords (Judicature Act 1873, s. 3); a like provision is made as to maritime causes in Scottish courts (Nautical Assessors [Scotland] Act 1894). The judicial committee of the privy council, besides its power to call in assessors in patent cases, is authorized to call them in for ecclesiastical causes (Appellate Jurisdiction Act 1876, s. 14).

In addition to the authorities cited in the text, see Taylor, Law of Evidence (9th ed., London, 1895); J. D. Lawson, Law of Expert and Opinion Evidence (1900).

EXPLOSIVES, a general term for substances which by certain treatment "explode," i.e. decompose or change in a violent manner so as to generate force. From the manner and degree of violence of the decomposition they are classified into "propellants" and "detonators," but this classification is not capable of sharp delimitation. In some cases the same substance may be employed for either purpose under altered external conditions; but there are some substances which, by certain reactions, proceed by the one method or the other. This is the only difference between propellant and detonator, or between explosive and non-explosive, as they are called.

The noise accompanying an explosion is due to an air wave, and is markedly different in the case of a detonator from a real propellant. Some cases of ordinary combustion can be accelerated into explosions by increasing the extent of contact between the combustible and the oxygen supplier, for instance, ordinary gas or dust explosions. Neither temperature nor quantity of heat energy necessarily gives an explosive action. Some metals, e.g. aluminium and magnesium, will, in oxidizing, produce a great thermal effect, but unless there be some explosive power present, it will not amount to an explosion.

Explosives may be mechanical mixtures of substances capable of chemical interaction with the production of large volumes of gases, or definite chemical compounds of a peculiar class known as "endothermic," the decomposition of which is also attended with the evolution of gases in large quantity.

All chemical compounds are either "endothermic" or "exo-
thermic." In endothermic compounds energy, in some form, has been taken up in the act of formation of the compound. Some of this energy has become potential, or rather the compound formed has been raised to a higher potential. This case occurs when two elements can be united only under some compulsion such as a very high temperature, by the aid of an electric current, or spark, or as a secondary product whilst, some other endothermic compounds combine only under the influence of an electric spark, and carbon and calcium in the electric furnace. The formation of chlorates by the action of chlorine on boiling potash is a good instance of a complex compound (potassium chlorate), being formed in small quantity as a secondary product whilst a large quantity of primary and simpler products (potassium chloride and water) is forming. In chlorate formation the greater part of the exothermic oxygen and nitrogen combine only under the influence of an endothermic substance. Another idea of the meaning of endothermic is obtained for acetylene. When 26 parts by weight of this substance is burnt, the heat produced will warm up 310,450 parts of water 1° C. Acetylene consists of 24 parts of carbon and 2 of hydrogen by weight. The 24 2 parts of carbon will, if in the form of pure charcoal, heat 202,000 parts of water 1°, and the 2 parts of hydrogen will heat 68,000 parts of water 1°; the total heat production being 260,000 heat units. Thus 26 grams of acetylene give an excess of 50,450 units over the amount given by the constituents. This excess of
heat energy is due to some form of potential energy in the compound which becomes actual heat energy at the moment of dissociation of the chemical union. The manner in which a substance is endothermic is of importance as regards the practical employment of explosives. Some particular endothermic state or form results from the mode of formation and the constituent internal structure of the molecule. Physical structure alone can be the cause of a relative endothermic state, as in the glass bulbs known as Rupert’s drops, &c., or even in chilled steel. Rupert’s drops fly in pieces on being scratched or cut to a certain depth. The cause is undoubtedly to be ascribed to the molecular state of the glass brought about by chilling from the melted state. The molecules have not had time to separate or arrange themselves in easy positions. In steel when melted the carbide of iron is no doubt dissolved throughout the liquid. When cooled slowly some carbide separates out more or less, and the steel is soft or annealed. When chilled the molecules of the solid steel of the same volume as the chilled glass or steel differs slightly from that in the annealed state. Superfused substances are probably in a similar state of physical potential or strain. Many metallic salts, and organic compounds especially, will exhibit this state when completely melted and then allowed to cool in a clean atmosphere. On touching with a little of the same substance in a solid state the liquids will begin to crystallize, at the same time becoming heated almost up to their melting-points. The molten gallium shows this excellently well, keeping liquid for years until touched with the solid metal, when there is a considerable rise of temperature as solidification takes place.

All carbon compounds, excepting carbon dioxide, and many if not all compounds of nitrogen, are endothermic. Most of the explosives in common use contain nitrogen in some form. Explosives are in every case the reverse of endothermic; they are relatively inert and react slowly or not at all, unless energy be expended upon them from outside. Water, carbon dioxide and most of the common minerals belong to this class.

The explosives actually employed at the present time include mixtures, such as gunpowders and some chlorate compositions, the ingredients of which separately may be non-explosive; compounds used singly, as guncotton, nitroglycerin (in the form of dynamite), picric acid (as lydiate or melinite), trinitroglycerine, nitroresols, mercury fulminate, &c.; combinations of some explosive compounds, such as cordite and the smokeless propellants in general use for military purposes; and, finally, blasting and detonating or igniting compositions, some of which contain inert diluting materials as well as one or more high explosives. Many igniting compositions are examples of the last type, consisting of a high explosive diluted with a neutral substance, and frequently containing in condition a composition which is inflamed by the explosion of the diluted high explosive, the flame in turn igniting the actual propellant.

Explosive Mixtures.—The explosive mixture longest known is undoubtedly gunpowder (q.v.) in some form—that is, a mixture of charcoal with sulphur and nitre, the last being the oxygen provider. Besides the nitrates of metals and ammonium nitrate, there is a limited number of other substances capable of serving in a sufficiently energetic manner as oxygen providers. A few chlorates, perchlorates, permanganates and chromates almost complete the list. Of these the sodium, potassium and barium chlorates are best known and have been actually tried, in admixture with some combustible substances, as practical explosives. Most other metallic chlorates are barred from practical employment owing to instability, deliquescent or other property.

Of the chlorates those of potassium and sodium are the most stable, and mixtures of either of these salts with sulphur or sulphides, phosphorus, charcoal, sugar, starch, finely-ground cellulose, coal or almost any kind of organic, i.e., carbon, compounds, give the most intense and most explosive mixture. In many cases these mixtures are not only fired or exploded with ease by heating to a certain temperature, but also by quite moderate friction or percussion. Consequently there is much danger in manufacture and storage, and however these mixtures have been made up, they are quite out of the question as propellants on account of their great tendency to explode in the manner of a detonator. In addition they are not smokeless, and leave a considerable residue which in a gun would produce serious fouling.

Mixtures of chlorates with aromatic compounds such as the nitro- or dinitro-benzenes or even naphthalene make very powerful blasting agents. The violent action of a chlorate mixture is due first to the rapid evolution of oxygen, and also to the fact that a chlorate can be detonated when alone. A tern of sulphuric acid will start the combustion of a chlorate mixture. In admixture with sulphur compounds and especially phosphorus, chlorates give extremely sensitive compositions, some of which form the basis of friction tube and firing mixtures.

Potassium and sodium perchlorates and permanganates make similar but slightly less sensitive explosive mixtures with the above-mentioned substances. Finely divided metals such as aluminium or magnesium give also with permanganates, chlorates or perchlorates sensitive and powerful explosives. Bichromates, although containing much available oxygen, form but feeble explosive mixtures, but some compounds of chromic acid with some acids and acetilides are extremely powerful as well as sensitive. Ammonium bichromate is the self-combustible after the type of ammonium nitrate, but scarcely an explosive.

Explosive Compounds.—Nearly all the explosive compounds in actual use either for blasting purposes or as propellants are nitrogen compounds, and are obtained more or less directly from nitric acid. Most of the propellants at present employed consist essentially of nitrates of some organic compound, and may be viewed theoretically as nitric acid, the hydrogen of which has been replaced by a carbon complex; such compounds are expressed by M-NO₃, where M indicates the carbon group which is in some manner united by means of oxygen to the nitram group. Guncotton and nitroglycerin are of this class. Another large class of explosives is formed by a more direct attachment of nitrogen to the carbon complex, as represented by M-N₂O₅. A number of explosives of the detonating type are of this class. They contain the same proportions of oxygen and nitrogen as nitrates, but are not nitrates. They have been termed nitro-derivatives for distinction. One of the simplest and longest-known members of this group is nitrobenzene, C₆H₅NO₂, which is an explosive, being one ingredient in rack-a-rock and other blasting compositions. The dinitrobenzenes, C₆H₄(NO₂)₂, made from it are solids which are somewhat extensively employed as constituents of some sporting powders, and in admixture with ammonium nitrate form a blasting powder of a “flameless” variety which is comparatively safe in dusty or “gassy” coal seams.

Picric acid or trinitrophenol, C₆H₅-OH(NO₂)₃, is employed as a high explosive for shell, &c. It requires, however, either to be enclosed and heated, or to be started by a powerful detonator to develop its full effect. Its compounds with metals, such as the potassium salt, C₂H₅OK(NO₂)₃, are then dry very easily detonated by friction or percussion and always on heating, whereas picric acid itself will burn very quietly when set fire to under ordinary conditions. Trinitrotoleune, C₆H₄-CH₃(NO₂)₃, is a high explosive resembling picric acid in the manner of its explosion (to which in fact it is a rival), but differs therefrom in not forming salts with metals. The nitronaphthols, C₆H₅-OH(NO₂)₃, and higher nitration products may be counted in the list. Their salts with metals behave much like the picrates.

All these nitro compounds can be reduced by the action of natural or synthetic substances called amines (q.v.), which are not always explosive in themselves, but can convert the nitrates of a self-combustible nature. Aminoacetic acid, for instance, will form a nitrate which burns rapidly but quietly, and might be employed as an explosive. By the action of nitrous acid at low temperatures on aromatic amines, e.g., aniline, C₆H₅NH₂, diazo compounds are produced. These are all highly explosive, and when in a dry state are for the most part also extremely sensitive to friction, percussion or heat. As many of these diazo compounds contain no oxygen their explosive nature must be ascribed to the peculiar state of union of the nitrogen. This state is attempted to be shown by the formulae such as, for

---

1 Not necessarily heat energy entirely. A number of substances —acetilides and some nitrogen compounds, such as nitrogen chloride —decompose with extreme violence, but little heat is produced.
instance, \(\text{C}_2\text{H}_5\text{N}_2\text{X}\), which may be some compound of diazo-
benzene. Probably the most vigorous high explosive at present
known is the substance called hydrazoic acid or azoimide (q.v.).
It forms salts with metals such as \(\text{AgN}_3\), which explode in a
peculiar manner. The ammonium compound, \(\text{NH}_4\text{N}_3\), may
become a practical explosive of great value.

Mercurlc fulminate, \(\text{HgC}_2\text{N}_3\text{O}_5\), is one of the most useful high
explosives known. It is formed by the action of a solution of
mercurous nitrate, containing some nitrous acid, on alcohol.
It is a white crystalline substance almost insoluble in cold water
and requiring 30 times its weight of boiling water for solution.
It may be heated to 180°C before exploding, and the explosion
so brought about is much milder than that produced by percus-
sion. It forms the principal ingredient in cap compositions,
in many fuses and in detonators. In many of these compositions
the fulminate is diluted by mixture with certain quantities of
inert powders so that its sensitiveness to friction or percussion
is just so much lowered, or slowed down, that it will fire another
mixture capable of burning with a hot flame. For detonating
dynamite, guncotton, &c., it is generally employed without
addition of any other explosive.

Smokeless Propellants.—Gunpowders and all other explosive
mixtures or compounds containing metallic salts must form
smoke on combustion. The solids produced by the resolution of
the compounds are in an extremely finely-divided state, and on
being ejected into the atmosphere become more or less attached
to water vapour, which is so precipitated, and consequently adds
to the smoke. The simplest examples of propellants of the smoke-
less class are compressed gases. Compressed air was the prop-
ellant for the Zalinski dynamite gun. Liquefied carbon dioxide
has also been proposed and used to a slight extent with the same
idea. It is scarcely practical, however, because when a quantity
of a gas liquefied by pressure passes back again into the gaseous
state, there is a great absorption of heat, and any remaining
liquid, and the containing vessel, are considerably cooled. Steam
guns were tried in the American Civil War in 1864; but a steam
gun is not smokeless, for the steam escaping from the long tube
or gun immediately condenses on expansion, forming white mist
or smoke.

At the earliest stage of the development of guncotton the
advantage of its smokeless combustion was fully appreciated
(see GUNCOTTONS). That it did not at once take its position as
the smokeless propellant, was simply due to its physical state—a fibrous porous mass—which burnt too quickly or even
detonated under the pressure required in fire-arms of any kind.
In the early eighties of the 19th century it was found that several
substances would partly dissolve or at least gelatinize guncotton,
and the moment when guncotton proper was obtained as a
colloid or jelly was the real start in the matter of smokeless
propellants.

Guncotton is converted into a gelatinous form by several
substances, such as esters, e.g. ethyl acetate or benzolate, acetone
and other ketones, and many benzene compounds, most of which
are volatile liquids. On contact with the guncotton a jelly is
formed which stiffens as the evaporation of the gelatinizing
agent proceeds, and finally hardens when the evaporation is
complete. Whilst in a stiff pasty state it may be cut, moulded
or pressed into any desired shape without any danger of ignition.
In fact guncotton in the colloid state may be hammered on an
anvil, and, as a rule, only the portion struck will detonate or fire.
Guncotton alone makes a very hard and somewhat brittle mass
after treatment with the gelatinizing agent and complete drying,
and small quantities of camphor, vaseline, castor oil and other
substances are incorporated with the gelatinous guncotton to
moderate this hard and brittle state.

All the smokeless powders, of which gelatinized guncotton
or nitratcd celluloses are the base, are moulded into some con-
vieniently shaped grain, e.g. tubes, cords, rods, disks or tablets,
so that the rate of burning may be controlled as desired. The
Vielle powder, invented in 1887 and adopted in France for a
magazine rifle, consisted of gelatinized guncotton with a little
picric acid. Later a mixture of two varieties of guncotton
gelatinized together was used. In addition to guncottons other
explosive or non-explosive substances are contained in some of
these powders. Guncotton alone in the colloid state burns very
slowly if in moderate-sized pieces, and when subdivided or made
into thin rods or strips it is still very mild as an explosive, partly
from a chemical reason, viz. there is not sufficient oxygen in it
to burn the carbon to dioxide. Many mixtures are consequently
in use, and many more have been proposed, which contain some
metallic salt capable of supplying oxygen, such as barium or
ammonium nitrate, &c., the idea being to accelerate the rate of
burning of the guncotton and if possible avoid the production of
smoke.

The discovery by A. Nobel that nitroglycerin could be incor-
porated with collodion cotton to form blasting gelatin (see
DYNAMITE) led more or less directly to the invention of ballistite,
which differs from blasting gelatin only in the relative amounts
of collodion, or soluble nitratcd cotton, and nitroglycerin. Ballis-
tite was adopted by the Italian government in 1890 as a military
powder. Very many substances and mixtures have been
proposed for smokeless powder, but the two substances, guncott
and nitroglycerin, have for the most part kept the field.

In the early part of this century, a considerable amount of nitro-
glycerin contains a slight excess of oxygen over that necessary
to convert the whole of the carbon into carbon dioxide; it burns
in a more energetic manner than guncotton; the two can be
incorporated together in any proportion whilst the guncotton
is in the gelatinous state; also all the liquids which gelatinize
the guncotton dissolve nitroglycerin, and, as these gelatinizing
liquids evaporate, the nitroglycerin is left entangled in the
guncotton jelly, and then shares more or less its colloidal character.
In burning the nitroglycerin is protected from detonation by the
gelatinous state of the guncotton but still adds to the rate of
burning and produces a higher temperature.

Desirable Qualities.—Smokelessness is one only of the desirable
properties of a propellant. All the present so-called smokeless
powders produce a little fume or haze, mainly due to the conden-
sation of the steam which forms one of the combustion products.
There is often also a little vapour from the substances, such as oil
mineral jelly, vaseline or other hydrocarbon added for lubrication or
to render the finished material pliable, &c. The gases produced
should neither be very poisonous nor exert a corrosive action on
metals, &c. The powder itself should have good keeping qualities,
that is, not be liable to chemical changes within ordinary ranges
of temperature or in different climates when stored for a few years.
In these powders slight chemical changes are generally followed
by slight changes in the physical state. All the smokeless powders
of the present day produce some oxide of nitrogen, traces of which hang
about the gun after firing and change rapidly into nitrous and nitric
acids, the former acids acting as oxides of nitrogen on the woods and
metals, as it acts as a carrier of oxygen. The fouling from modern
smokeless powders is a slight deposit of acid grease, and the remedy
consists in washing out the bore of the piece with an alkaline liquid.
The cappell, mingled with the smokeless powders, is often added to smokeless powders are supposed to act as lubricants to
some extent. They are not so effective in this respect as mineral
salts, and the rifling of both small-arms and ordnance using smokeless
powders is severely gripped by the metal of the projectile. The
alkaline fouling produced by the black and brown powders acted
as a preventive of rusting to some extent, as well as a lubricant in the
bore.

Danger in Manufacture.—In the case of the old gunpowders,
the most dangerous manufacturing operation was incorporation.
With the modern colloid propellants the most dangerous operations
are the physical preparation of the propellant by the process of
drying of guncotton, &c. After once the gelatinizing solvent has
been added, all the mechanical operations can be conducted, practi-
cally, with perfect safety. This statement appears to be correct for
the large and long nitrate and nitrocellulose, or gelatinized
glycerin or other substances. Should they become ignited, which
is possible by a rise of temperature (to say 180°) or contact with a
flame or fire, the detonation is so rapid that dangerous effects
are to be avoided.

As a rule naval and military smokeless powders are shaped into
flakes, tubes, cords or cylinders, with or without longitudinal perfor-
ations. All the modifications in shape and size are intended to regulate
the rate of burning. Sporting powders are often coloured for trade
distinction. Some powders are blackened by glazing with pure
graphite, as is done with black powders. One object of this glazing
is to prevent the grains or pieces becoming joined by the carbon
for rods or pieces of some smokeless powders might possibly unite
under considerable pressure, producing larger pieces and thus
altering the rate of burning. Most smokeless powders are fairly

insensitive to shock. All these gelatinized powders are a little less easily ignited than black powders. A slightly different cap composition is used in lieu of black powder, and cannot generally require a small primer or starter of powdered black gunpowder.

It is desired that a propellant shall produce the maximum velocity with the minimum pressure. The pressure should start gently so that the inertia of the projectile is overcome without any undue local strain on the breech near the powder chamber, and more especially that as more and more space is given to the gases by the movement of the projectile up the gun to the muzzle, gas should be produced with sufficient rapidity to keep the pressure nearly uniform or slightly increasing along the bore. The leading idea for improving the formulation of propellants is to obtain the greatest possible pressure regularly developed, and at the same time the lowest temperatures. (W. R. E. II.)

Law.—In 1860 an act was passed in England "to amend the law concerning the making, keeping and carriage of gunpowder and compositions of an explosive nature, and concerning the manufacture and use of fireworks" (23 & 24 Vict. c. 130), whereby previous acts on the same subject were repealed, and minute and stringent regulations introduced. Amending acts were passed in 1861 and 1862. In 1875 was passed the Explosives Act (38 & 39 Vict. c. 17), which repealed the former acts, and dealt with the whole subject in a more comprehensive manner. This act, containing 122 sections, and applying to Scotland and Ireland, as well as to England, constitutes, with various orders in council and home office orders, a complete code. The act of 1875 was based on the report of a committee of the House of Commons, public opinion having been greatly excited on the subject by a terrible explosion on the Regent's Canal in 1874. Explosives are thus defined: (1) Gunpowder, nitroglycerine, dynamite, gun-cotton, blasting powders, fulminate of mercury or of other metals, coloured fuses, and every other substance, whether similar to those above-mentioned or not, used or manufactured with a view to produce a practical effect by explosion or a pyrotechnic effect, and including (2) log-signals, fireworks, fuses, rockets, percussion caps, detonators, cartridges, ammunition of all descriptions, and every adaptation or preparation of an explosive as above defined. Part i. deals with gunpowder, providing that it shall be manufactured only at factories lawfully existing or licensed under the act; that it shall be kept (except for private use) only in existing or new magazines or stores, or in registered premises, licensed under the act. Private persons may not keep for their own use any quantities of more than thirty pounds. The act also prescribes rules for the proper keeping of gunpowder on registered premises. Part ii. deals with nitroglycerine and other explosives; part iii. with inspection, accidents, search, &c.; part iv. contains various supplementary provisions. By order in council the term "explosive" may be extended to any substance which appears to be specially dangerous to life or property by reason of its explosive properties, or to any process liable to explosion in the manufacture thereof, and the provisions of the act then extend to such substance just as if it were included in the term "explosive" in the act. The act lays down minute and stringent regulations for the sale of gunpowder, restricting the sale thereof in public thoroughfares or places, or to any child apparently under the age of thirteen; requiring the sale of gunpowder to be in closed packages labelled; it also lays down general rules for conveyance, &c. The act also gives power by order in council to define, from time to time, the composition, quality and character of any explosive, and to classify explosives, and such orders in council are frequently made including new substances; those in force will be found in the Statutory Rules and Orders, tit. "explosive substance." The Merchant Shipping Act 1864 imposes restrictions on the carriage of dangerous goods in a British or foreign vessel, "dangerous goods" meaning aquafortis, vitriol, naptha, benzine, gunpowder, lucifer matches, nitro-glycerine, petroleum and any explosive within the meaning of the Explosives Act 1875. The act is administered by the home office, and an annual report is published containing the proceedings of the inspectors of explosives and an account of the working of the act. Each annual report gives a list of explosives at the time authorized for manufacture or importation, and appendices containing information as to accidents, experiments, &c.

Practically every European country has legislated on the lines of the English act of 1875, Austria taking the lead, in 1877, with an explosives ordinance almost identical with the English act. The United States of America has also included in the new explosives acts regulating the manufacture, storage and importation of explosives. (See also PETROLEUM.)

W. Renant.

EXPRESS (through the French from the past participle of the Lat. exprimère, to press out, by transference used of representing objects in painting or sculpture, or of thoughts, &c. in words), a word signifying that which is clearly and definitely set forth or represented, explicit, and thus used of meaning, a law, a contract and the like, being specially contrasted with "implied." Thus in law, malice, for which there is actual evidence, as apart from that which may be inferred from the acts of the person charged, is known as "express." The word is most frequently used with the idea of something done with a definite purpose; the term "express train," now meaning one that travels at a high speed over long distances with few intermediate stoppages, was, in the early days of railways, applied to what is now usually called a "special," i.e. a train not running according to the ordinary time-tables of the railway company, but for some specific purpose, or engaged by a private person. About 1845 this term became used for a train running to a particular place without stopping. Similarly in the British postal service express delivery is a special and immediate delivery of a letter, parcel, &c., by an express messenger at a particular increased rate. The system was adopted in 1851.

In the United States of America, express companies for the rapid transmission of parcels and luggage generally perform the function of the post office or the railways in the United Kingdom and the continent of Europe. Not only do they deliver goods, but by the cash on delivery system (see Cash the express companies act as agents both for the purchaser and seller of goods. They also serve as a most efficient agency for the transmission of money, the express money order being much more easily convertible than the postal money orders, as the latter can only be redeemed at offices in large and important towns. The system dates back to 1839, when one William Frederick Harned (1813-1849), a Connecticut inventor and successful railway contractor, used his own account the carrying of small parcels and the performance of small commissions. Obliged to leave the company's service or abandon his enterprise, he started an "express" service between Boston and New York, carrying parcels, executing commissions and collecting drafts and bills. Alvin Adams followed in 1840, also between Boston and New York. From 1840 to 1845 the system was adopted by many others between the more important towns
EXPROPRIATION—EXTENSION

throughout the States. The attempt to carry letters also was stopped by the government as interfering with the post office. In 1854 began the amalgamation of many of the companies. Thus under the name of the Adams Express Company the services started by Harnden and Adams were consolidated. The lines connecting the west and east by Albany, Buffalo and the lakes were consolidated in the American Express Company, under the direction of William G. Fargo (q.c.), Henry Wells and Johnston Livingston, while another company, Wells, Fargo & Co., operated on the Pacific coast. The celebrated "Pony Express" was started in 1860 between San Francisco and St. Joseph, Missouri, the time scheduled being eight days. The service was carried on by relays of horses, with stations 25 m. apart. The charge made for the service was $2.50 per ¼ oz. The completion of the Pacific Telegraph Company line in 1861 was followed by the discontinuance of the regular service.

The name "express" is applied to a rifle having high velocity, flat trajectory and long fixed-sight ranges; and an "express-bullet" is a light bullet with a heavy charge of powder used in such a rifle (see Rifle).

EXPROPRIATION, the taking away or depriving of property (Late Lat. expropriare, to take away, proprium, i.e. that which is one's own). The term is particularly applied to the compulsory acquisition of private property by the state or other public authority.

EXPULSION (Lat. expulsio, from expellere), the act of driving out, or of removing a person from the membership of a body or the holding of an office, or of depriving him of the right of attending a meeting, &c. In the United Kingdom the House of Commons can by resolution expel a member. Such resolution cannot be questioned by any court of law. But expulsion is only resorted to in cases where members are guilty of offences rendering them unfit for a seat in the House, such as being in open rebellion, being guilty of forgery, perjury, fraud or breach of trust, misappropriation of public money, corruption, conduct unbecoming the character of an officer and a gentleman, &c. It is customary to order the member, if absent, to attend in his place, before an order is made for his expulsion (see May, Parliamentary Practice, 1896, p. 56 seq.). Municipal corporations or other local government bodies have no express power to expel a member; but in such cases where the law declares the member to have vacated his seat, or where power is given by statute to declare the member's seat vacant. In the cases of officers and servants of the crown, tenure varies with the nature of the office. Some officials hold their offices ad vitam aut culpam, or dum bene se gesserunt, others can be dismissed at any time and without reason assigned and without compensation. In the case of membership of a voluntary association (club, &c.) the right of expulsion depends upon the rules, and must be exercised in good faith. Courts of justice have jurisdiction to prevent the improper expulsion of the member of a voluntary association where that member has a right of property in the association.

In the case of meetings, where the meeting is one of a public body, any person not a member of the body is entitled to be present only on sufferance, and may be expelled on a resolution of the body. In the case of ordinary public meetings those who convene the meeting stand in the position of licensors to those attending and may revoke the licence and expel any person who creates disorder or makes himself otherwise objectionable.

Expropriation of Aliens.—Under the Naturalization Act of 1879, the Expropriation Act 1879 established the conditions affecting aliens in England where the property was removed. The political difference was that it only applied to electoral rights. In the very exceptional cases in which it was retained in the statute book, expulsion was considered to have fallen into desuetude, but it has been revived by the Alien Act of 1905 (5 Edw. VII. c. 13). Under this act powers are given to the secretary of state to make an order requiring an alien to leave the United Kingdom within a time fixed by the order and thereafter to remain outside the United Kingdom, subject to certain conditions, provided it is certified to him that the alien has been convicted of any felony or misdemeanour or other offence for which the court has power to impose imprisonment without the option of a fine, &c., or that he has been sentenced in a foreign country with which there is an extradition treaty, for a crime not being an offence of a political character. There are also provisions applicable within one year after the alien has entered the United Kingdom in the case of pauper aliens. Precautions are taken to prevent, as far as possible, any abuse of the power of expulsion. Under the French law of expulsion (December 3, 1849) there are no such precautions, the minister of the interior having an absolute discretion to order any foreigner as a measure of public policy to leave French territory and in fact to have him taken immediately to the frontier.

EXTENSION (Lat. ex, out; tendere, to stretch), in general, the action of straining or stretching out. It is usually employed metaphorically (cf. the phrase an "extension of time," a period allowed in excess of what has been agreed upon). It is used as a technical term in logic to describe the total number of objects to which a given term may be applied; thus the meaning of the term "King" in "extension" means the kings of England, Italy, Spain, &c. (cf. Denotation), while in "intension" it means the attributes which taken together make up the idea of kinghood (see Connotation). In psychology the literal sense of extension is retained, i.e. "spread-outness." The perception of space by the senses of sight and touch, as opposed to semispatial perceptions by smell and hearing, is that of "continuous expanse composed of positions separated and connected by distances" (Stout); to this the term "extension" is applied. The perception of separate objects involves position and distance, but these taken together are not extension, which necessarily implies continuity. To move one's finger along the keys of a piano gives both the position and the distance of the keys; to move it along the frame gives the idea of extension. By expanding this idea we obtain the conception of all space as an extended whole. To this perception are necessary both form and material. It should be observed the actual quality of a stimulus (rough, smooth, dry, &c.) has nothing to do with the spatial perception as such, which is concerned purely with what is known as "local signature." The elementary undifferentiated sensation excited by the stimuli exerted by a continuous whole is designated its "extensive quantity," or "extensity." That term has to do not with the kind of object which excites the sensation, but simply with the vague massiveness of the latter. As such it is distinguishable in thought from extension, though it is not easy to say whether and if so how far the quantitative aspect of space can exist apart from spatial order. Extensity as an element in the complex of extension must be carefully distinguished from intensity. Mere increase of pressure implies increase of intensity of sensation; to increase the extensity the area, so to speak, of the exciting stimulus must be increased. Thus the extensity (also called "voluminosity," or "massiveness") of the sensation produced by a roll of thunder is greater than that produced by a whistle or the bark of a dog. It should be observed that this application of the idea of extensity to sensation in general, rather than to the matter which is the exciting stimulus, is only an analogy, an attempt to explain a common psychic phenomenon by terminology which is intrinsically suitable to the physical. As a natural consequence the term represents different shades of meaning in different treatises, verging sometimes towards the physical, sometimes towards the psychic, meaning.

In connection with extension elaborate psycho-physical experiments have been carried out, with the power of perception. Unhappily, e.g. with the object of comparing the accuracy of actual and visual perception and discovering what are the least differences which each can observe. At a distance two lights appear as one, just as two stars distinguishable through a telescope are one to the naked eye (see Vision); again if the points of a compass are brought close together and pressed lightly on the skin the sensation, though vague and diffused, is a single one. See Psychology and works there quoted; also Space and Time.
EXTERRITORIALITY, a term of international law, used to denominate certain immunities from the application of the rule that every person is subject for all acts done within the boundaries of a state to its local laws. It is also employed to describe the quasi-extraterritorial position of subjects of the dwelling-place of an accredited diplomatic agent, and of the public ships of one state while in the waters of another. Latterly its sense has been extended to all cases in which states refrain from enforcing their laws within their territorial jurisdiction. The cases recognized by the law of nations relate to: (1) the persons and belongings of foreign sovereigns, whether incognito or not; (2) the persons and belongings of ambassadors, ministers, plenipotentiary, and other accredited diplomatic agents and their suites (but not consuls, except in some non-Christian countries, in which they sometimes have a diplomatic character); (3) public ships in foreign waters. Exterritoriality has also been granted by treaty to the subjects and citizens of contracting Christian states resident within the territory of certain non-Christian states. Lastly, it is held that when armies or regiments are allowed by a foreign state to cross its territory, they necessarily have exterritorial rights. "The ground upon which the immunity of sovereign rulers from process in our courts," said Mr Justice Wills in the case of *Miguel v. Sultan of Johore*, 1894, "is recognized by our law, is that they would be absolutely inconsistent with the status of an independent sovereign that he should be subject to the process of a foreign tribunal," unless he deliberately submits to its jurisdiction. It has, however, been held where the foreign sovereign was also a British subject (Duke of Brunswick v. King of Hanover, 1844), that he is amenable to the jurisdiction of the English Courts in respect of transactions done by him in his capacity as a subject. A "foreign sovereign" may be taken to include the president of a republic, and even a potentate whose independence is not complete. Thus in the case, cited above, of *Miguel v. Sultan of Johore*, the sultan was ascertained to have abandoned all right to contract with foreign states, and to have placed his territory under British protection. The court held that he was, nevertheless, a foreign sovereign in so far as immunity from British jurisdiction was concerned. The immunity of a foreign diplomatic agent, as the direct representative of a foreign sovereign (or state), is based on the same grounds as that of the sovereign authority itself. The international practice in the case of Great Britain was confirmed by an act of parliament of the reign of Queen Anne, which is still in force. The preamble to this act states that "the Court of Great Britain has not recognized the persons of any foreign sovereign or person in a most outrageous manner had insulted the person of the then ambassador of his Czarish Majesty, emperor of Great Russia," by arresting and detaining him in custody for several hours, "in contempt to the protection granted by Her Majesty, contrary to the law of nations, and in prejudice of the rights and privileges which ambassadors and other public ministers, authorized and received as such, have at all times been thereby possessed of, and ought to be kept sacred and inviolable." This preamble has been repeatedly held by our courts to be declaratory of the English common law. The act provides, "The British sovereign, his heirs and successors, or which he may be represented, may, by letters, commissions, warrants, or other writing of whatsoever kind, to all his servants, agents, or other persons accredited by him, for the purposes of their duty, in any foreign place, execute all his acts, do and perform all acts, which he may lawfully and properly do in and about any such foreign place and country, as if they were done in and about the British dominions; and all persons in any such foreign place, or countries, or any of them, are hereby required to obey, and pay obedience to, and may peaceably and quietly execute the same, and all orders and proceedings for the same, as if they were done in and about the British dominions, which is hereby declared to be no infringement of any foreign laws, customs, or other acts, or any agreements or treaties between the United Kingdom and any foreign prince, nation, or state."

Writers frequently describe the extraterritoriality of both embassies and ships as absolute. There is, however, this difference, that the extraterritoriality of the latter not being, like that of embassies, a derived one, there seems to be no ground for its destruction. It was, nevertheless, laid down by the arbitrators in the "Alabama" case (Cockburn dissenting), that the privilege of extraterritoriality accorded to vessels had not been admitted into the law of nations as an absolute right, but solely as a proceeding founded on the principle of courtesy and mutual deference between different nations, and that it could therefore "never be appealed to for the protection of acts done in violation of neutrality."

The extraterritorial settlements in the Far East, the privileges of Christians under the arrangements made with the Ottoman Porte, and other exceptions from local jurisdictions, are subject to the conditions laid down in the treaties by which they have been created. There are also cases in which British communities have grown up in barbarous countries without the consent of any local authority. All these are regulated by orders in council, issued now in virtue of the Foreign Jurisdiction Act 1890, an act enabling the crown to exercise any jurisdiction it may have "within a foreign country" in as ample a manner
as if it had been acquired "by cession or conquest of territory." A very exceptional case of extritoriality is that granted to the pope under a special Italian enactment. (T. BA)

EXTORTION (Lat. extorso, from extorquere, to twist out, to take away by force), in English law the term applied to the extortion by public officers of money or money's worth not due at all, or in excess of what is due, or before it is due. Such extortion, unless made in good faith (i.e. in honest mistake as to the sum properly payable), is a misdemeanour by the common law and is punishable by fine and (or) imprisonment. Besides, the punishment above stated, an action for twice the value of the thing extorted lies against officers of the king (1725, 3 Edw. I. c. 26). There are numerous provisions for the punishment of particular officers who make illegal exactions or take illegal fees: e.g. sheriffs and their officers (Sheriffs Act 1887), county court bailiffs (County Courts Act 1888), clerks of courts of justice, and gaolers who exact fees from prisoners. A gaoler is also punishable for detaining the corpse of a prisoner as security for debt. The term "public officer" is not limited to officers under the crown; and there are old precedents of criminal punishments for extortion against churchwardens, and against millers and ferrymen who demand tolls in excess of what is customary under their franchise.

The term extortion is also applied to the extraction of money or money's worth by menace of personal violence or by threats to accuse of crime or to publish defamatory matter about another person. These offences fall partly under the head of robbery and partly under blackmail, or what in French is termed chantage.

EXTRACT (from Lat. extrahere, to draw out), in pharmacy, the name given to preparations formed by evaporating or concentrating solutions of active principles; tinctures are solutions which have not been subjected to any evaporation. "Liquid extracts" are those of a syrupy consistency, and are generally prepared by treating the drug with the solvent (water, alcohol, &c.) and concentrating the solution until it attains the desired consistency. "Ordinary extracts" are thick, tenacious and sometimes even dry preparations; they are obtained by evaporating solutions as obtained above, or the juices expressed from the plants.

Extracts, in chemical technology, is a process for separating one substance from another by taking advantage of the varying solubility of the components in some chosen solvent. The term "lixiation" is used when water is the solvent. In laboratory practice all the common solvents are employed. With small quantities it may suffice to shake the substance with the solvent, the mixture being heated if necessary, filtered and disil or otherwise remove the solvent from the distillate. For larger quantities continuous extraction is advisable. This may be carried out in many forms of apparatus; one of the most convenient is the Soxhlet extractor, in which the extract siphons into the flask containing the solvent, and so maintains the quantity of available solvent practically constant. Continuous extraction is generally the practice in technology. One of the most important applications is in the fat and gelatine industries.

EXTRADITION (Lat. ex, out, and traditio, handing over), the surrender of an alleged criminal for trial by a foreign state where he has taken refuge, to the state against which the alleged offence has been committed. When a person who has committed an offence in one country escapes to another, what is the duty of the latter with regard to him? Should the country of refuge try him in its own courts according to its own laws, or deliver him up to the country whose laws he has broken? To the general question international law gives no certain answer. Some jurists, Grotius among them, incline to hold that a state is bound to give up fugitive criminals, but the majority appear to deny the obligation as a matter of right, and prefer to put it on the ground of comity. And the universal practice of nations is to surrender criminals only in consequence of some special treaty with the country which demands them.

There are two practical difficulties about extradition which have probably prevented the growth of any uniform rule on the subject. One is the variation in the definitions of crime adopted by different countries. The second is the possibility of the process of extradition being employed to get hold of a person who is wanted by his country, not really for a criminal, but for a political offence. In modern states, and more particularly in England, offences of a political character have always been carefully excluded from the operation of the law of extradition.

i. UNITED KINGDOM.—The Extradition Acts 1870-1873 (34 & 35 Vict. c. 62, and 36 & 37 Vict. c. 60) and the Fugitive Offenders Act 1881 (44 & 45 Vict. c. 69) deal with different branches of the same subject, the recovery and surrender of fugitive criminals. The Extradition Acts apply in the case of countries with which Great Britain has extradition treaties. The Fugitive Offenders Act applies—(1) as between the United Kingdom and any British possession, (2) as between any two British possessions, and (3) as between the United Kingdom or a British possession and certain foreign countries, such as Turkey and China, in which the crown exercises foreign jurisdiction.

Conditions of Surrender.—In spite of some earlier authorities it has long been settled that in English law there is no power to surrender fugitive criminals to a foreign country without express statutory authority. Such authority is now given by the Extradition Acts 1870-1873, but only in the case of the offences therein specified, and with regard to countries with which an arrangement has been entered into, and to which the acts have been applied by order in council. The acts are further to be applied, subject to such "conditions, exceptions and qualifications as may be deemed expedient" (s. 2); and these conditions, &c., are invariably to be found in the extradition treaty which is the subject of the order in council applying the Extradition Acts to a particular country. To support a demand for extradition from Great Britain it is therefore necessary to show that the offence is one of those enumerated in the Extradition Acts, and also in the particular treaty, and that the acts charged amount to the offence according to the laws both of Great Britain and of the state demanding the surrender.

Surrender of Subjects.—A further question arises where a state is called on to surrender one of its own subjects. Some of the treaties, such as those with France and Germany, stipulate that neither contracting party shall surrender its own subjects, and in such cases a British subject cannot be surrendered by his own country. The treaties with Spain, Switzerland and Luxemburg provide for the surrender by Great Britain of her own subjects, but there is no reciprocity. Other treaties, such as those with Austria, Belgium, Russia and the Netherlands, give each party the option of surrendering or refusing to surrender its own subjects in each particular case. Under such treaties British subjects are surrendered unless the secretary of state intervenes to forbid it. Lastly, some treaties, such as that with the United States, contain no restriction of this kind, and the subjects of each other are freely surrendered to the other. Surrender by Great Britain is also subject to the following restrictions contained in s. 3 of the Extradition Act 1870—

(1) that the offence is not of a political character, and the requisition has not been made with a view to try and punish for an offence of a political character; (2) that the prisoner shall not be liable to be tried for any but the specified extradition offences; (3) that he shall not be surrendered until he has been tried and served his sentence for offences committed in Great Britain; and (4) that he shall not be actually given up until fifteen days after his committal for extradition, so as to allow of an application to the courts.

Political Offences.—The question as to what constitutes a political offence is one of some nicety. It was discussed in In re Costanti (1890, 1 Q.B. 149), where it was held, following the opinion of Mr Justice Stephen in his History of the Criminal Law, that to give an offence a political character it must be "incidental to and form part of political disturbances." Extradition was accordingly refused for homicide committed in the course of an armed rising against the constituted authorities. In the more
EXTRADITION

The United Kingdom has extradition treaties with practically all civilized foreign countries; and though it is not practicable to state which of the statutory extradition offences are included in each, it may be said generally that crimes 1 to 17 inclusive are covered in all, though Rumania has reserved the right to refuse, and Portugal does refuse, to surrender for a crime punishable with death.

The act of 1873 provides for the surrender of accessories before and after the fact to extradition crimes, and most of the treaties contain a clause by which extradition is to be granted for participation in any of the crimes specified in the treaty, provided that such participation is punishable by the laws of both countries. Several of the treaties also contain clauses providing for optional surrender in respect of any crime not expressly mentioned for which extradition can be granted by the laws of both countries.

It is further to be noted that the restrictions on surrender in the Extradition Acts apply only to surrenderers by Great Britain. Foreign countries may surrender fugitives to Great Britain without any treaty, if they are willing to do so and their law allows of it, and such surrenderers have not infrequently been made. But when surrendered for an extradition crime, the prisoner cannot be tried in England for any other crime committed before such surrender, unless he has been arrested, or has had an opportunity of returning, to the foreign state from which he was extradited.

Procedure.—To obtain from a foreign country the extradition of a fugitive from the United Kingdom, it is necessary to procure a warrant for his arrest, and to send it, or a certified copy, to the home secretary together with such further evidence as is required by the treaty with the country in question. In most cases an information or deposition containing evidence which would justify a committal for trial in Great Britain will be required. The home secretary will then communicate through the foreign secretary and the proper diplomatic channels to the authorities in the foreign state, and in case of urgency will ask them by telegraph for a provisional arrest. For the arrest in the United Kingdom of fugitive criminals whose extradition is requested by a foreign state, two procedures are provided in ss. 7 and 8 of the act of 1870:—(1) On a diplomatic requisition supported by the warrant of arrest and documentary evidence, the home secretary, if he thinks the crime is not of a political character, will order the chief magistrate at Bow Street to proceed; and such magistrate will then issue a warrant of arrest on such evidence as would be required if the offence had been committed in the United Kingdom; (2) More usually, any magistrate or justice of the peace may issue a provisional warrant of arrest on evidence which would support such a warrant if the crime had been committed within his jurisdiction. In practice a sworn information is required, but this may be based on a telegram from the foreign authorities. The magistrate or justice must then report the issue of the warrant to the home secretary, who may cancel it and discharge the prisoner. When arrested on the provisional warrant, the prisoner will be brought up before a magistrate and remanded to Bow Street, and will then be further remanded, as occasion requires, at Bow Street. The magistrate at Bow Street will notify the home secretary when a formal requisition for surrender has been made; and unless such requisition is made in reasonable time the prisoner is entitled to be discharged. The examination of the prisoner prior to his committal for extradition ordinarily takes place at Bow Street. The magistrate is required to hear evidence that the alleged offence is of a political character or is not an extradition crime. If satisfied in these respects, and if the foreign warrant of arrest is duly authenticated, and evidence is given which according to English law would justify a committal for trial, if the prisoner has not yet been tried, or would prove a conviction if he has already been convicted, the magistrate will commit him for extradition. Under the Extradition Act 1893 the home secretary, if of opinion that removal to Bow Street would be dangerous to the prisoner's life, or prejudicial to his health, may order the case to be taken by a magistrate at the place where the prisoner was apprehended, or then is, and the magistrate may order the

recent case of *In re Meunier* (1894, 2 Q.B. 415), an Anarchist was charged with causing two explosions in Paris—one at the Café Véry resulting in the death of two persons, and the other at certain barracks. It was not contended that the outrage at the café was a political crime, but it was argued that the explosion at the barracks came within the description. The court, however, held that to constitute a political offence there must be two or more parties in the state, each seeking to impose a government of its own choice on the other, which was not the case with regard to Anarchist crimes. The party of anarchy was the enemy of all governments, and its effects were directed primarily against the general body of citizens. The test applied in the earlier case is perhaps the more satisfactory of the two.

With regard to the provision that surrender shall not be granted if the requisition has in fact been made with a view to try and punish for an offence of a political character, it was decided in the case of *Arton* (1896, 1 Q.B. 108) that a mere suggestion, that after his surrender for a non-political crime, the prisoner would be interrogated on political matters (his alleged complicity in the Panama scandal), and punished for his refusal to answer, was not enough to bring him within the provision. The court also held that it had no jurisdiction to entertain a suggestion that the request of the French government for his extradition was not made in good faith and in the interests of justice.

Extradition Offences.—The following is a list of crimes in respect of which extradition may be provided for under the Extradition Acts 1870-1873, and the Slave Trade Act 1873.

**Extradition Act 1870:** (1) Murder; (2) Attempt to murder; (3) Conspiracy to murder; (4) Manslaughter; (5) Counterfeiting and altering money, uttering counterfeit or altered money; (6) Forgery, counterfeiting, and altering and uttering what is forged or counterfeited or altered; (7) Embezzlement and larceny; (8) Obtaining money or goods by false pretences; (9) Crimes by bankrupts against bankruptcy law; (10) Fraud by a bailiff, banker, agent, factor, trustee or director, or member or public officer of any company made criminal by any law for the time being in force; (11) Rape; (12) Abduction; (13) Child-stealing; (14) Burglary and house-breaking; (15) Arson; (16) Robbery with violence; (17) Threats by letter or otherwise with intent to extort; (18) Crimes committed at sea:—(a) Piracy by the law of nations; (b) Sinking or destroying a vessel at sea, or attempting or conspiring to do so; (c) Assault on a ship on the high seas, with intent to destroy life or to do grievous bodily harm; (d) Revolt, or conspiring to revolt, by two or more persons on board a ship on the high seas against the authority in command; (19) Bribery. **Extradition Act 1873:**—(20) Kidnapping and false imprisonment; (21) Perjury and subornation of perjury. This act also extends to indictable offences under 24 & 25 Vict. c. 96, 97, 98, 99, 100, and amending and substituting acts. Among such offences included in various extradition treaties are the following:—(22) Obtaining valuable securities by false pretences; (23) Receiving any money, valuable security or other property, knowing the same to have been stolen or unlawfully obtained; (24) Falsification of accounts (see *In re Arton*). 1867, 1 Q.B. 415. Malicious injury or death to a person, with intent to procure his death, under 6 & 7 Vic. c. 2. 25. False pretences, with intent to procure a person's conviction for a criminal offence be indictable; (26) Knowingly making, with or without lawful authority, any instrument, tool or engine adapted and intended for the counterfeiting of coin of the realm; (27) Abandoning children; exposing or unlawfully detaining them; (28) Any malicious act done with intent to endanger the safety of any person in a railway train; (29) Wounding or inflicting grievous bodily harm; (30) Assault occasioning actual bodily harm; (31) Assaulting a magistrate or peace or public officer; (32) Indecent assault; (33) Unlawful carnal knowledge, or any attempt to have unlawful carnal knowledge, of a girl under age; (34) Bigamy; (35) Administering drugs or using instruments with intent to procure the miscarriage of women; (36) Any indictable offence under the laws for the time being in force in relation to bankruptcy. **Slave Trade Act 1873** (36 & 37 Vict. c. 88, s. 27):—(37) Dealing in slaves in such manner as to constitute a criminal offence against the laws of both states.
EXTRADOS—EXTREME UNCTION

prisoner to be detained in such place. After committal for extrac- 
dition, every prisoner has fifteen days in which to apply for 
habeebs corpus, and after such period, or at the close of the habeebs 
corpus proceedings if they are unsuccessful, the home secretary 
issues his warrant for surrender, and the prisoner is handed over 
to the officers of the foreign government.

The Extradition Acts apply to the British colonies, the 
government having substituted for its secretary of state. Their 
operation may, however, be suspended by order in council, as 
the case in Canada, where the colony has passed an Extradition 
Act of its own (see Statutory Rules and Orders).

Fugitive Offenders Act.—There are no extradition treaties 
certain in countries in which the crown exercises foreign jurisdic- 
tion, such as Cyprus, Turkey, Egypt, China, Japan, Corea, 
Zanzibar, Morocco, Siam, Persia, Somali, &c. In these countries 
the Fugitive Offenders Act 1881 (44 & 45 Vict. c. 69) has been 
appointed, pursuant to s. 36 of that statute, and the measures for 
receiving surrender of a fugitive criminal are the same as in a 
British colony. The act, however, applies to persons over 
whom the crown has jurisdiction in these territories, and generally 
is expressly restricted to British subjects.

Under this act a fugitive from one part of the king's dominions 
to another, or to a country where the crown exercises foreign jurisdic- 
tion, may be brought back by a procedure analogous to 
extradition, but applicable only to treason, piracy and offences 
punishable with twelve months' imprisonment with hard labour 
or more. The original warrant of arrest must be endorsed by one 
of several authorities where the offenders happen to be,—in 
practice by the home secretary in the United Kingdom. If any 
happens to be an offender, the crown having the original 
provisional arrest may be made, as under the Ex- 
tradition Acts. The fugitive must then be brought up for 
arrangement before a local magistrate, who, if the endorsed 
warrant is duly authenticated, and evidence is produced "which, 
according to the law administered by the magistrate, raises a 
strong or probable presumption that the offender committed the 
offence, and that the act applies to it," may commit him for 
return. An interval of fifteen days is allowed for habeebs corpus 
proceedings, and (s. 10) the court has a large discretion to discharging 
the prisoner, or impose costs on the prisoner. The prisoner 

in this case of fugitive offenders from one part of the United 
Kingdom to another, it is enough to get the warrant of arrest 
backed by a magistrate having jurisdiction in that part of 
the United Kingdom where the offender happens to be. 
A warrant issued by a metropolitan police magistrate may be 
executed, without backing, by a metropolitan police officer any- 
where, and there are certain other exceptions, but as a rule 
a warrant cannot be executed without being backed by a local 
magistrate.

2. UNITED STATES.—Foreign extradition is purely an affair of 
the United States, and not for the individual states themselves. 
Upon a demand upon the United States for extradition, there is 
a preliminary examination before a commissioner or judge before 
the court which issued the extradition (Revised Statutes, Title LXVI.; 
22 Statutes at Large, 215). It is enough to show probable guilt (Ornelas v. Ruiz, 161 United States 
Reports, 502). An extradition treaty covers crimes previously 
committed. If a Power, with which the United States have 
such a treaty, surrenders a fugitive charged with a crime not 
included in the treaty, he may be tried in the United States for 
such crime. Inter-state extradition is regulated by act of 
Congress under the Constitution of the United States (Article IV. s. 
2: United States Revised Statutes, s. 5278). A surrender may 
be demanded of one properly charged with an act which cons- 
itutes a crime under the laws of the demanding state, although 
it be no crime in the other state. A party improperly surrendered 
may be released by writ of habeebs corpus, either from a state 
or United States court (Robb v. Connolly, 117 U.S. Reports, 624). 
On his return to the state from which he fled, he is subject to prosecu- 
tion for any crime, though on a foreign extradition the law is other- 
wise (Luscelles v. Georgia, 148 U.S. Reports, 537). (S. E. B. C.)

EXTREME UNCTION, a sacrament of the Roman Catholic Church. 
In James v. 14 it is ordained that, if any believer is 
sick, he shall call for the elders of the church; and they shall 
pray over him, anointing him with oil in the name of the Lord; 
and the prayer of faith shall save him that is sick, and the Lord 
shall raise him up; and if he have committed sins, it shall be 
forgiven him.

Origien republished medical art on the ground that the pre- 
scription here cited is enough; modern faith-healers and Peculiar 
People have followed in his wake. The Catholic Church has more 
wisely left physicians in possession, and elevated the anointing 
of the sick into a sacrament to be used only in cases of mortal 
sickness, and even then not to the exclusion of the healing art. 
It has been general since the 9th century. The council of 
Florenc 1859, 1439 has defined it—

"The fifth sacrament is extreme unction. In matter it is olive 

oil. In form, by a bishop, it shall not be given except to a sick person 

whose death is apprehended. He shall be anointed in the following 

places: the eyes, ears, nostrils, mouth, hands, feet, reins. The 

form of the sacrament is this: Through this anointing of thee and 

through its most pious mercy, be forgiven all thy sins of sight, &c. 

and so in respect of the other organs. A priest can administer 

this sacrament. But its effect is to make whole the mind, and, 

so far as it expedit, the body as well."

This sacrament supplements that of penance (viz. remission of 
post-baptismal sin) in the sense that any guilt unconfessed or 
left over after normal penances imposed by confessors is purged 
thereby. It was discussed in the 12th century whether this 
sacrament is indelible like baptism, or whether it can be repeated; 
and the latter view, that of Peter Lombard, prevailed.

It was a popular opinion in the middle ages that extreme 
unction extinguishes all ties and links with this world, so that he 
who has received it must, if he recovers, renounce the eating of 
food and matrimonial relations. A few peasants of Lombardy 
still believe that one who has received extreme unction ought to be 
left to starve, and the sick person may be starved to death 
through the withholding of food on superstitious grounds. Such 
opinions, combated by bishops and councils, were due to the 
fluence of the consolamentum of the Cathars (q.v.). In both 
sacraments the death-bed baptism of an earlier age seems to 
survive, and they both fulfil a deep-seated need of the human 
spirit.

Some Gnostics sprinkled the heads of the dying with oil 
and water to render them invisible to the powers of darkness; but in 
the East generally, where the need to compete with the Cathar 
sacrament of Consolatio was less acutely felt, extreme unction 
is unknown. The Latinizing Armenians adopted it from Rome 
in the crusading epoch. At an earlier date, however, it was usual 
to anoint the dead."

In the Roman Church the bishop blesses the oil of the sick 
used in extreme unctions on Holy Thursday at the Chrismal 
Mass, using the following prayer of the sacramentaries of 
Gelasius and Hadrian:

"Send forth, we pray Thee, O Lord, Thy holy spirit, the Paracle- 
ate from Huen, into this fatness of oil, which Thou hast 
designated to produce from the greatest need for refreshment of mind and body; 
and through Thy holy benediction may it be for all that anoint, taste, 
touch, a protection of mind and body, of soul and spirit, unto the 
easement of all pain, all weakness, all sickness of mind and body; 
wherefore Thou hast anointed priest, kings and prophets and martyrs 
with that chrism, perfected by Thee, O Lord, blessed and abiding 
in our bowels in the name of our Lord Jesus Christ." 

See L. Duchesne, Origines du Culte Chrétien (Paris, 1898). 

(5.C. C.)

1 The oil left over from the year before is burnt.
EYBESCHÜTZ, JONATHAN (1660–1754), German rabbi, was from 1750 rabbi in Altona. He was a man of erudition, but he owed his fame chiefly to his personality. Few men of the period so profoundly impressed their mark on Jewish life. He became specially notorious because of a curious controversy that arose concerning the amulets which Eynebenschutz was suspected of issuing. These amulets recognized the Messianic claims of Sabbatai Sebi (q.v.), and a famous rabbinic contemporary of Eyneschutz, Jacob Emden, boldly accused him of being a sibyl. Though Eyneschutz was a zealous preacher in Jewish life of the period, and though there is insufficient evidence against Eyebenschitz, Emden may be credited with having crushed the lingering belief in Sabbatai current even in some orthodox circles. (L.A.)

EYCK, VAN, the name of a family of Flemish painters in whose works the rise and mature development of art in western Flanders are represented. Though bred in the valley of the Meuse, they finally established their professional domicile in Ghent and in Bruges; and there, by skill and inventive genius, they changed the traditional habits of the Flemish school, introduced the principle of Flemish design, and introduced a complete revolution into the technical methods of execution familiar to their countrymen.

1. HUBERT (Huybrecht) van Eyck (? 1366–1420) was the oldest and most remarkable of this race of artists. The date of his birth and the records of his progress are lost amidst the ruins of the earlier civilization of the valley of the Meuse. He was born about 1366, at Maeseck, under the shelter or protection of a Benedictine convent, in which art and letters had been cultivated from the beginning of the 8th century. But after a long series of wars, when the country became insecure, and the schools which had flourished in the towns decayed—he wandered to Flanders, and there for the first time gained a name. As court painter to the hereditary prince of Burgundy, and as client to one of the richest of the Ghent patricians, Hubert is celebrated. Here, in middle age, between 1410 and 1420, he signalized himself as the inventor of a new method of painting. Here he lived in the pay of Philip of Charolais till 1421. Here he painted pictures for the corporation, whose chief magistrates honoured him with a state visit in 1424. His principal masterpiece, the "Worship of the Lamb," commissioned by Jodocinck Vijdts, lord of Pamele, is the noblest creation of the Flemish school, a piece of which we possess all the parts dispersed from St Bavon in Ghent to the galleries of Brussels and Berlin,—one upon which Hubert laboured till he died, leaving it to be completed by his brother. Almost unique as an illustration of contemporary feeling for Christian art, this great composition can only be matched by the "Fount of Salvation," in the museum of Madrid. It represents, on numerous panels, Christ on the judgment seat, with the Virgin and St John the Baptist at his sides, hearing the songs of the angels, and contemplated by Adam and Eve, and, beneath him,—the Lamb shedding his blood in the presence of angels, apostles, prophets, martyrs, knights and hermits. On the outer sides of the panels are the Virgin and the angel anunciate, the sibyls and prophets who foretold the coming of the Lord, and the donors in prayer at the feet of the Baptist and Evangelist.

After this great work was finished it was placed, in 1432, on an altar in St Bavon of Ghent, with an inscription on the framework describing Hubert as "maior quo nemo repertus," and setting forth, in colours as imperishable as the picture itself, that Hubert began and John afterwards brought it to a finish. Van Eyck certainly wished to guard against an error which ill-informed posterity showed itself but too prone to foster, the error that he alone had composed and carried out an altarpiece executed jointly by Hubert and himself. His contemporaries may be credited with full knowledge of the truth in this respect, and the facts were equally well known to the duke of Burgundy or the chiefs of the corporation of Bruges, who visited the painter's house in state in 1432, and the members of the chamber of rhetoric at Ghent, who reproduced the Agnus Dei as a tableau vivant in 1436. Yet a later generation of Flemings forgot the claims of Hubert, and gave the honours that were his due to his brother John exclusively.

The solemn grandeur of church art in the 15th century never found, out of Italy, a nobler exponent than Hubert van Eyck. His representation of Christ as the judge, between the Virgin and St John, affords a fine display of realistic truth, combined with pure drawing and gorgeous colour, and a happy union of earnestness and simplicity with the deepest religious feeling. In contrast with earlier productions of the Flemish school, it shows a singular depth of tone and great richness of detail. Finished with surprising skill, it is executed with the new oil medium, of which Hubert shared the invention with his brother, but of which no rival artists at the time possessed the secret,—a medium which consists of subtle mixtures of oil and varnish applied to the moistening of pigments after a fashion, only kept secret for a time from goldsmiths of neighbouring cities, but unrevealed to the Italians till near the close of the 15th century. When Hubert died on the 18th of September 1426 he was buried in the chapel on the altar of which his masterpiece was placed. According to tradition, he was then 60 years old. His arm was preserved as a relic in a casket above the portal of St Bavon of Ghent. During a life of much apparent activity and surprising successes he taught the elements of his art to his brother John, who survived him.

2. JOHN (Jan) van Eyck (? 1385–1440). The date of his birth is not much more accurately known than that of his elder brother, but he was born much later than Hubert, who took charge of him and made him his "disciple." Under this tuition John learnt to draw and paint, and mastered the properties of colours from Pliny. Later on, Hubert admitted him into partnership, and both were made court painters to Philip of Charolais. After the breaking up of the prince's household in 1421, John became his own master, left the workshop of Hubert, and took an engageament as painter to John of Bavaria, at that time resident at the Hague as count of Holland. From the Hague he returned in 1424 to take service with Philip, now duke of Burgundy, at a salary of 100 livres per annum, and from that time till his death John van Eyck remained the faithful servant of his prince, who never treated him otherwise than graciously. He was frequently employed in missions of trust; and following the fortunes of a chief who was always in the saddle, he appears for a time to have been in ceaseless motion, receiving secret service at Leiden, drawing his salary at Bruges, yet settled in a fixed abode at Lille. In 1428 he joined the embassy sent by Philip the Good to Lisbon to beg the hand of Isabella of Portugal. His portrait of the bride fixed the duke's choice. After his return he settled finally at Bruges, where he married, and his wife bore him a daughter, known in after years as a nun in the convent of Maaeck. At the christening of this child the duke was sponsor, and this was but one of many distinctions by which Philip the Good rewarded his painter's merits. Numerous altarpieces and portraits now give proof of van Eyck's extensive practice. As finished works of art and models of conscientious labour they are all worthy of the name they bear, though not of equal excellence, none being better than those which were completed about 1432. Of an earlier period, a "Consecration of Thomas à Becket" has been preserved, and may now be seen at Chatsworth, bearing the date of 1421; no doubt this picture would give a fair representation of van Eyck's talents at the moment when he started as an independent master, but that time and accidents of omission and commission have altered its state so much as to such an extent that no conclusive opinion can be formed respecting it. The panels of the "Worship of the Lamb" were completed nine years later. They show that John van Eyck was quite able to work in the spirit of his brother. He had not only the lines of Hubert's compositions to guide him, he had also those parts to look at and to study which Hubert had finished. He continued the work with almost as much vigour as his master. His own experience had been increased by travel, and he had seen the finest varieties of landscape in Portugal and the Spanish provinces. This enabled him to transfer to his pictures the charming scenery of lands.
EYE

91

to Burston, 12 m. from Eye. From the discovery of numerous bones and Roman urns and coins it has been thought that the place was once the cemetery of a Roman camp. William I. gave the lordship of Eye to Robert Malet, a Norman, who built a castle and a Benedictine monastery which was at first subordinate to the abbey of Bernay in Normandy. Eye is a borough by prescription. In 1205 King John granted to the townsmen a charter freeing them from various tolls and customs and from the jurisdiction of the shire and hundred courts. Later charters were granted by Elizabeth in 1558 and 1574, by James I. in 1604, and by William III. in 1697. In 1574 the borough was newly incorporated under two bailiffs, ten chief and twenty-four inferior burgesses, and an annual fair on Whit-Monday and a market on Saturday were granted. Two members were returned to each parliament from 1571 till 1832, when the Reform Act reduced the membership to one. By the Redistribution Act of 1885 the representation was merged in the Eye division of the county. The making of pillow-lace was formerly carried on extensively, but practically ceased with the introduction of machinery.

EYE (O. Eng. edge, Ger. Auge; derived from an Indo-European root also seen in Lat. oc-ulus, the organ of vision q.v.).

Anatomy.—The eye consists of the eyeball, which is the true organ of sight, as well as of certain muscles which move it, and of the lachrymal apparatus which keeps the front of it in a moist condition. The eyeball is contained in the front of the orbit and is a sphere of about an inch (24 mm.) in diameter. From the front of this a segment of a lesser sphere projects slightly and forms the cornea (fig. 1, c). There are three coats

The cornea is quite continuous with the sclerotic but has a greater convexity. Under the microscope it is seen to consist of five layers. Most anteriorly there is a layer of stratified epithelium, then an anterior elastic layer, then the substantia propria of the cornea which is fibrous with spaces in which the stellate corneal corpuscles lie, while behind this is the posterior elastic layer and then a delicate layer of endothelium. The transparency of the cornea is due to the fact that all these structures have a refractive index close to that of water.

The middle or vascular coat of the eye consists of the choroid, the ciliary processes and the iris. The choroid (fig. 1, c, ch) does not come quite as far forward as the corneo-scleral junction; it is composed of numerous blood-vessels and pigment cells bound together by connective tissue and, superficially, is lined by a delicate layer of pigmented connective tissue called the *lamina suprachoroidea* in contact with the already-mentioned periciliary lymph space. On the deep surface of the choroid is a structureless basal lamina.

The ciliary processes are some seventy triangular ridges, radially arranged, with their apices pointing backward (fig. 1, pc), while their bases are level with the corneo-scleral junction. They are as vascular as the rest of the choroid, and contain in their interior the ciliary muscle, which consists of radiating and circular fibres. The radiating fibres (fig. 1, mc) rise, close to the canal of Schlemm, from the margin of the posterior elastic lamina of the cornea, and pass backward and outward into the ciliary processes and anterior part of the choroid, which they pull forward when they contract. The circular fibres lie just internal to these and are for ever wanting in short-sighted people.

The iris (fig. 1, I) is the colored diaphragm of the eye, the centre of which is pierced to form the pupil; it is composed of a connective tissue stroma containing blood-vessels, pigment cells and muscle fibres. In front of it is a reflection of the same layer of endothelium which lines the back of the cornea, while behind both it and the ciliary processes is a double layer of epithelium, deeply pigmented, which really belongs to the retina. The pigment in the substance of the iris is variously coloured in different individuals, and is often deposited after birth, so that, in newly-born European children, the colour of the eyes is often slate-blue owing to the black pigment at the back of the iris showing through. White, yellow or reddish-brown pigment is deposited later in the substance of the iris, causing the appearance, with the black pigment behind, of grey, hazel or brown eyes. In blue-eyed people very little interstitial pigment is formed, while in Albino the posterior pigment is also absent and the blood-vessels give the pink coloration. The muscle fibres of the iris are described as circular and radiating, though it is still uncertain whether the latter are really muscular rather than elastic. On to the front of the iris, at its margin, the posterior layer of the posterior elastic lamina is continued as a series of ridges called the *ligamentum pectinatum iridis*, while between these ridges are depressions known as the spaces of Fontana.

The inner or sensory layer of the wall of the eyeball is the retina; it is a delicate transparent membrane which becomes thinner as the front of the eye is approached. A short distance behind the ciliary processes the nervous part of it stops and forms a scalloped border called the ora serrata, but the pigmented layer is continued on behind the ciliary processes and iris, as has been mentioned, and is known as the *pars ciliaris retinae* and *pars iridica retinae*. Under the microscope the posterior part of the retina consists of two layers. The inner layer, that is, the layer visible from the lens and vitreous, is composed of two layers in the following order:—(1) Layer of nerve fibres; (2) Layer of ganglion cells; (3) Inner nuclear layer; (4) Inner nuclear layer; (5) Outer nuclear layer; (6) Outer nuclear layer; (7) Layer of rods and cones; (8) Pigmented layer.

The layer of nerve fibres (fig. 2, 4) is composed of the axis-cylinders only of the fibres of the optic nerve which pierce the sclerotic, choroid and all the succeeding layers of the retina to radiate over its surface.

The ganglionic layer (fig. 2, 2) consists of a single stratum of large ganglion cells, each of which is continuous with a fibre of the preceding layer which forms its axon. Each also gives off a number of finer processes (dendrites) which arborize in the next layer.

The inner molecular layer (fig. 2, 4) is formed by the interlacement of the dendrites of the last layer with those of the cells of the inner nuclear layer, which is called the lamina proreos. The outer nuclear layer (fig. 2, 5) contains three different kinds of cells, but the most important and numerous are large bipolar cells, which send one process into the inner molecular layer, as has just been mentioned, and the other into the outer molecular layer, where they arborize with the ends of the rod and cone fibres.

The outer molecular layer (fig. 2, 6) is very narrow and is formed by the arborizations just described. The outer nuclear layer (fig. 2, 5) consists of oval cells, which are of two kinds. The rod granules are transversely striped, and are connected externally with the rods; while internally processes pass into the outer molecular layer to end in a knob around which the arborizations of the inner nuclear cells lie. The cone granules are situated more externally, and are in close contact with the cones; internally their processes form a foot-plate in the outer molecular layer from which arborizations extend.

The layer of rods and cones (fig. 2, 9) contains these structures, the rods being more numerous than the cones. The rods are spindle-shaped bodies, of which the inner segment is thicker than the outer. The cones are thicker and shorter than the rods, and resemble Indian clubs, the handles of which are directed outward and are transversely striped. In the outer part of the rods the visual purple or rhodopsin is found.

The pigmented layer consists of a single layer of hexagonal cells containing pigment, which is capable of moving towards the rods and cones when the eye is exposed to light and away from them in the dark.

Supporting the delicate nervous structures of the retina are a series of connective tissue rods known as the fibres of Müller (fig. 2, Ci); these run through the thickness of the retina at right angles to its surface, and are joined together on the inner side of the layer of nerve fibres to form the *inner limiting membrane*. More externally, at the bases of the rods and cones, they unite again to form the outer limiting membrane.

When the retina is looked at with the naked eye from in front two small marks are seen on it. One of these is an oval depression about 3 mm. across, which, owing to the presence of pigment, is of a yellow colour and is known as the yellow spot (*macula lutea*); it is situated directly in the antero-posterior axis of the eyeball, and at its margin the nerve fibre layer is thinned and the ganglionic layer thickened. At its centre, however, both these layers are wanting, and in the layer of rods and cones only the cones are present. This central part is called the *fovea centralis* and is the point of acutest vision. The second mark is situated a little below and to the inner side of the yellow spot; it is a circular disk with raised margins and a depressed centre and is called the optic disk; in structure it is a complete contrast to the yellow spot, for all the layers except that of the nerve fibres are wanting, and consequently, as light cannot be appreciated here, it is known as the "blind spot." It marks the point of entry of the optic nerve, and at its centre the retinae artery appears and divides into branches. An appreciation of the condition of the optic disk is one of the chief objects of the ophthalmoscope.

The crystalline lens (fig. 1, L) with its ligament separates the aqueous from the vitreous chamber of the eye; it is a biconvex lens the posterior surface of which is more curved than the anterior. Radiating from the anterior and posterior poles are three faint lines forming a Y, the posterior Y being erect and the anterior inverted. Running from these figures are a series of lamellae, like the layers of an onion, each of which is made up of a number of fibrils called the lens fibres. On the anterior surface of the lens is a layer of epithelial cells, which, towards the margin or equator, gradually elongate into lens fibres. The whole lens is enclosed in an elastic structureless membrane, and, like the...
The orbit contains seven muscles, six of which rise close to the optic foramen. The levator palpebrae superioris is the highest, and passes forward to the superior tarsal plate and fornix of the conjunctiva. The superior and inferior recti are inserted into the upper and lower surfaces of the eyeball respectively; they make the eye look inward as well as up or down. The external and internal oblique are inserted into the sides of the eyeball and make it look outward or inward. The superior oblique runs forward to a pulley in the inner and front part of the roof of the orbit, round which it turns to be inserted into the outer and back part of the 1, Orbicular muscle. 2, Lachrymal sac. 3, Eyeball. It turns the 2, Lachrymal canal. 4, Lachrymal duct. 5, Glance downward and 3, Punctum. 6, Angular artery. 7, Inferior 4, Caruncula.

The lachrymal oblique rises from the inner and front part of the floor of the orbit, and is also inserted into the outer and back part of the eyeball. It directs the glance upward and outward. Of all these muscles the superior oblique is supplied by the fourth cranial nerve, the external rectus by the sixth and the rest by the third.

The posterior part of the eyeball and the anterior parts of the muscles are enclosed in a lymph space, known as the capsule of Tenon, which assists their movements.

**Emberyology**—As is pointed out in the article Brain, the optic vesicle grow out from the fore-brain, and the part nearest the brain becomes constricted and elongated to form the optic stalk (see figs. 4 and 5, β). At the same time the ectoderm covering the side of the head thickens and becomes invaginated to form the lens vesicle (see figs. 4 and 5, δ), which later loses its connection with the surface and approaches the optic vesicle, causing that structure to become cupped for its reception, so that what was the optic vesicle becomes the optic cup and consists of an external and an internal layer of cells (fig. 6 β and δ). Of these the outer cells become the retinal pigment, while the inner form the other layers of the retina. The invagination of the optic cup extends, as the choroidal fissure (not shown in the diagrams), along the lower and back part of the optic stalk, and into this slit sinks some of the surrounding mesoderm to form the vitreous body and the hyaloid arteries, one of which persists. When this has happened the fissure closes up. The anterior epithelium of the lens vesicle remains, but from the posterior the lens fibres are developed and these gradually fill up the cavity. The superficial layer of head ectoderm, from which the lens has been invaginated and separated, becomes the anterior...
epithelium of the cornea (fig. 6, e), and between it and the lens the mesoderm sinks in to form the cornea, iris and anterior chamber of the eye, while surrounding the optic cup the mesoderm forms the sclerotic and choroid coats (fig. 7, 9 and f). Up to the seventh month the pupil is closed by the *membrana pupillaris*, derived from the capsule of the lens which is part of the mesodermal ingrowth through the choroidal fissure already mentioned. The hyaloid artery remains, as a prolongation of the retinal artery to the lens, until just before birth, but after that its sheath forms the canal of Stilling. Most of the fibres of the optic nerve are centripetal and begin as the axons of the ganglion cells of the retina; a few, however, are centrifugal and come from the nerve cells in the brain.

The eyelids are developed as ectodermal folds, which blend with one another about the third month and separate again before birth in Man (fig. 7, k). The lachrymal sac and duct are formed from solid ectodermal thickenings which later become canalized.

It will thus be seen that the optic nerve and retina are formed from the brain ectoderm; the lens, anterior epidermis of the cornea, skin of the eyelids, conjunctiva and lachrymal apparatus from the superficial ectoderm; while the sclerotic, choroid, viterrine and aqueous humours as well as the iris and cornea are derived from the mesoderm.

Comparative Anatomy.—The Acrania, as represented by Amphioxus (the lancelet), have a patch of pigment in the fore part of the brain which is regarded as the remains of a degenerated eye. In the Cyclostomata the hog (Myxine) and larval lamprey (Ammocoetes) have well-developed eyes lying beneath the skin and devoid of lens, iris, cornea and sclerotic as well as eye muscles. In the adult lamprey (Petromyzon) these structures are developed at the metamorphosis, and the skin becomes transparent, rendering sight possible. Vascular muscles are developed, but, unlike most vertebrates, the inferior rectus is supplied by the sixth nerve while all the others are supplied by the third. In all vertebrates the retina consists of a layer of senso-neural cells, the rods and cones, separated from the light by the other layers which together represent the optic ganglia of the invertebrates; in the latter animals, however, the senso-neural cells are nearer the light than the ganglia.

In fishes the eyeball is flattened in front, but the flat cornea is compensated by a spherical lens, which, unlike that of other vertebrates, is adapted for near vision when at rest. The iris in some bony fishes (Teleostei) is not contractile. In the Teleostei, too, there is a process of the choroid which projects into the vitreous chamber and runs forward to the lens; it is known as the *processus falciformis*, and, besides nourishing the lens, is concerned in accommodation. This specialized group of fishes is also remarkable for the possession of a so-called choroid gland, which is really a rete mirabile (see *Arteriae*) between the choroid and sclerotic. The sclerotic in fishes is usually chondrified and sometimes calcified or ossified. In the retina the rods and cones are about equal in number, and the cones are very large. In the cartilaginous fishes (Elasmobranchs) there is a silvery layer, called the tapetum lucidum, on the retinal surface of the choroid.

In the Amphibia the cornea is more convex than in the fish, but the lens is circular and the sclerotic often chondrified. There is no processus falciformis or tapetum lucidum, but the class is interesting in that it shows the first rudiments of the ciliary muscle, although accommodation is brought about by shifting the lens. In the retina the rods outnumber the cones and these latter are smaller in Amphibia than in Man. In some Amphibia coloured oil globules are found in connexion with the cones, and sometimes two cones are joined, forming double or twin cones.

In Reptilia the eye is spherical and its anterior part is often protected by bony plates in the sclerotic (Lacertilia and Chelonia). The ciliary muscle is striated, and in most reptiles accommodation is effected by relaxing the ciliary ligament as in higher vertebrates, though in the snakes (Ophidia) the lens is shifted as it is in the lower forms. Many lizards have a vascular projection of the choroid into the vitreous, foreshadowing the pecten of birds and homologous with the papilla of fishes. In the retina the rods are scarce or absent.

In birds the eye is tubular, especially in nocturnal and raptorial forms: this is due to a lengthening of the ciliary region, which is always protected by bony plates in the sclerotic. The pecten, already mentioned in lizards, is a pleated vascular projection from the optic disk towards the lens which in some cases it reaches. In Apteryx this structure disappears. In the retina the cones outnumber the rods, but are not as numerous as in the reptiles. The ciliary muscle is of the striped variety.

In the Mammalia the eye is largely protected in the orbit, and bony plates in the sclerotic are only found in the monotremes. The cornea is convex except in aquatic mammals, in which it is flattened. The lens is biconvex in diurnal mammals, but in nocturnal and aquatic it is spherical. There is no pecten, but the numerous hyaloid arteries which are found in the embryo represent it. The iris usually has a circular pupil, but in some ungulates and kangaroos it is a transverse slit. In the Cetacea this transverse opening is kidney-shaped, the hilum of the kidney being above. In many carnivores, especially nocturnal ones, the slit is vertical, and this form of opening seems adapted to a feeble light, for it is found in the owl, among birds. The tapetum lucidum is found in Ungulata, Cetacea and Carnivora. The ciliary muscle is unstriped. In the retina the rods are more numerous than the cones, while the macula lutea only appears in the Primates in connexion with binocular vision.

Among the accessory structures of the eye the retractor bulbi muscle is found in amphibians, reptiles, birds and many mammals; its nerve supply shows that it is probably a derivative of the external or posterior rectus. The nictitating membrane or third eyelid is well-developed in amphibians, reptiles, birds and some few sharks; it is less marked in mammals, and in Man is only represented by the little *plica semilunaris*. When functional it is drawn across the eye by special muscles derived from the retractor bulbi, called the *bursalis* and *pyramidalis*. In connexion with the nictitating membrane the Harderian gland is developed, while the lachrymal gland secretes fluid for the other eyelids to spread over the conjunctiva. These two glands are specialized parts of a row of glands which in the Urodela (tailed amphibians) are situated along the lower eyelid; the outer or posterior part of this row becomes the lachrymal gland, which in higher vertebrates shifts from the lower to the upper eyelid, while the inner or anterior part becomes the Harderian gland. Below the amphibians glands are not necessary, as the water keeps the eye moist.

The lachrymal duct first appears in the tailed amphibians; in snakes and gekko lizards, however, it opens into the mouth.

For literature up to 1900 see R. Wiedersheim’s *Vergleichende Anatomie der Wirbeltiere* (Jena, 1902). Later literature is noticed in the catalogue of the Physiological Series of the R. College of Surgeons of England Museum, vol. iii. (London, 1896). (F. C. P.)

Eye Diseases.—The specially important diseases of the eye are those which temporarily or permanently interfere with
sight. In considering the pathology of the eye it may be remembered that (1) it is a double organ, while (2) either eye may have its own trouble.

1. The two eyes act together, under normal conditions, for all practical purposes exactly as if there were but one eye placed in the middle of the face. All impressions made upon one retina, to the one side of a vertical line through the centre, the *fovea centralis*, before giving rise to conscious perception cause a stimulation of the same area in the brain. Impressions formed simultaneously, for instance, on the right side of the right retina and on corresponding areas of the right side of the left retina, are conveyed to the same spots in the right occipital lobe of the brain. Pathological processes, therefore, which are localized in the right or left occipital lobes, or along any part of the course of the fibres which pass from the right or left optic tracts to the visual cortex, affect both eyes by conveying a stimulation of function of the right or left halves of the two retinae. *Hemianopia*, or half-blindness, arising from these pathological changes, is of very varying degrees of severity, according to the nature and extent of the particular lesion. The blind areas in the two fields of vision, corresponding to the outward projection of the paralyzed retinal areas, are always symmetrical both in shape and degree. The central lesion may for instance be very small, but at the same time destructive to the nerve tissue. This will be revealed as a sector-shaped or insular symmetrical complete blindness in the fields of vision to the opposite side. Or a large central area, or an area comprising many or all of the nerve fibres which pass to the visual centre on one side, may be involved in a lesion which causes impairment of function, but no actual destruction of the nerve tissue. There is thus caused a symmetrical weakening of vision (*amblyopia*) in the opposite fields. In such cases the colour vision is so much more evidently affected than the sense of form that the condition has been called *hemiacromatopsia* or half-colour blindness. Hemianopia may be caused by haemorrhage, by embolism, by tumour growth which either directly involves the visual nerve elements or affects them by compression and by inflammation. Transitory hemianopia is rare and is no doubt most frequently of toxic origin.

The two eyes also act as if they were one in accommodating. It is impossible for the two eyes to accommodate simultaneously to different extents, so that where there is, as occasionally happens, a difference in focus between them, this difference remains the same for all distances for which they are adapted. In such cases, therefore, both eyes cannot ever be accurately adapted at the same time, though either may be alone. It often happens as a consequence that the one eye is used to receive the sharpest images of distant, and the other of near objects. Any pathological change which leads to an interference in the accommodation of one eye will cause the images of objects to be blurred. Such a lesion is usually one of the third nerve itself. Consequently, a unilateral accommodation paresis is almost invariably associated with pareses of some of the oculo-motor muscles. A bilateral accommodation paresis is not uncommon. It is due to a nuclear or more central cerebral disturbance. Unlike a hemianopia, which is mostly permanent, a double accommodation paresis is frequently transitory. It is often a post-diphtheritic condition, appearing alone or associated with other pareses.

Both eyes are also normally intimately associated in their movements. They move in response to a stimulus or a combination of stimuli, emanating from different centres of the brain, but one which is always equally distributed to the corresponding muscles in both eyes, so that the two lines of fixation meet at the succession of points on which attention is directed. The movements are thus associated in the same direction, to the right or left, upwards or downwards, &c. In addition, owing to the space which separates the two eyes, convergent movements, caused by stimuli equally distributed between the two inferior recti, are required for the fixation of nearer and nearer lying objects. These movements would not be necessary in the case of a single eye. It would merely have to accommodate.

The converging movements of the double eye occur in association with accommodation, and thus a close connexion becomes established between the stimuli to accommodation and convergence. All combinations of convergent and associated movements are constantly taking place normally, just as if a single centrally-placed eye were moved in all directions and altered its accommodation according to the distance, in any direction, of the object which is fixed.

Associated and convergent movements may be interfered with pathologically in different ways. Cerebral lesions may lead to their impairment or complete abolition, or they may give rise to involuntary spasmodic action, as the result of paralysing or irritating the centres from which the various co-ordinated impulses are controlled or emanate. Lesions which do not involve the centres may prevent the response to associated impulses in one eye alone by interfering with the functional activity of one or more of the nerves along which the stimuli are conveyed. Paralysis of oculo-motor nerves is thus a common cause of defects of association in the movements of the double eye. The great advantage of simultaneous binocular vision—viz. the appreciation of depth, or stereoscopic vision—is thus lost for some, or it may be all directions of fixation. Instead of seeing singly with two eyes, there is then double-vision (*diplopia*). This persists so long as the defect of association continues, or so long as the habit of mentally suppressing the image of the faultily-directed eye is not acquired.

In the absence of any nerve lesions, central or other, interfering with these associated movements, the eyes continue throughout life to respond equally to the stimuli which cause these movements, even when, owing to a visual defect of the one eye, binocular vision has become impossible. It is otherwise, however, with the proper co-ordination of convergent movements. These are primarily regulated by the unconscious desire for binocular vision, and more or less firmly associated with accommodation. When one eye becomes blind, or when binocular vision for other reasons is lost, the impulse is gradually, as it were, unlearnt. This is the cause of *divergent concomitant squint*. Under some acute or chronic form of convergent which is in excess of the requirements of fixation, may be acquired from different causes. This gives rise to *convergent concomitant squint*.

For Astigmatism, &c., see the article Vision.

2. Taking each eye as a single organ, we find it to be subject to many diseases. In some cases both eyes may be affected in the same way, e.g. where the local disease is a manifestation of some general disturbance. Apart from the fibrous coat of the eye, the sclera, which is little prone to disease, and the external muscles and other adnexa, the eye may be looked upon as divided into two parts: (a) the dioptric media, and (b) the parts more or less directly concerned with the reception of pathological conditions affecting either of these elements may interfere with sight.

The dioptric media, or the transparent portions which are concerned in the transmission of light to, and the formation of images upon, the retina, are the following: the cornea, the *aqueous humour*, the *crystalline lens* and the *vitreous humour*. Loss of transparency in any of these media leads to blurring of the retinal images of external objects. In addition to loss of transparency the cornea may have its curvature altered by pathological processes. This necessarily causes imperfect of sight. The crystalline lens, on the other hand, may be dislocated, and thus cause image distortion.

The Cornea.—The transparency of the cornea is mainly lost by inflammation (*keratitis*), which causes either an infiltration of its tissues with leucocytes, or a more focal, more destructive ulcerative process.

Inflammation of the cornea may be primary or secondary, i.e. the inflammatory changes met with in the corneal tissue may be directly connected with one or more foci of inflammation in the cornea itself or the focus or foci may be in some other part of the eye. Only the very superficial forms of primary keratitis, those confined to the epithelial layer, leave no permanent change.
there is otherwise always a loss of tissue resulting from the inflammation and this loss is made up for by more or less densely intraparenchymal connective tissue (nuclea, leucoma). These according to their site and extent cause greater or less visual disturbance. In superficial, diffuse or circumscribed, circumscribed, or non-circumscribed, it may be complicated by deeper inflammations of the eye such as iritis and cyclitis. In some cases the anterior chamber is invaded by pus (hypopyon). The healing of a corneal ulcer is characterized by the disappearance of pain where this has been a symptom and by the rounding off of its sharp margins as epithelium spreads over them from the surrounding healthy parts. Ulcers tend to extend either in depth or superficially, rarely in both manners at the same time. A deep ulcer leads to perforation with more or less serious consequences according to the extent of the perforation. Often an eye bears permanent traces of a perforation in adhesion of the iris to the back of a corneal scar or in changes in the lens capsule (capsular cataract). In other cases the ulcerated cornea may yield to pressure from within, which causes it to bulge forwards (staphyloma).

The principal causes of primary keratitis are trauma and infection from the conjunctiva. Traumata are most serious when the body causing the wound is not aseptic or when microorganisms, for example, cocci may be introduced. When the conjunctiva is affected, effect a lodgment before healing of the wound has sufficiently advanced. In infected cases a complication with iritis is not uncommon owing to the penetration of toxins into the anterior chamber.

Inflammations of the cornea are the most important diseases of the eye, because they are among the most frequent, because of the value of the cornea to vision and because much good can often be done by judicious treatment and much harm result from wrong interference and neglect. The treatment of primary keratitis must vary according to the cause. Generally speaking, the use of antiseptics is indicated, and the conjunctiva, in most uncomplicated, the latter deeper and complicated corneal inflammation, irido-cyclitis and anterior choroiditis. Superficial scleritis or, as it is often called, episcleritis, is a long-continued disease which is associated with very varying degrees of discomfort. The chronic nature of the affection depends mainly upon the tendency that the inflammation has to recur in successive patches at different parts of the sclera. Often only one eye at a time is affected. Each patch lasts for a month or two and is succeeded by another after an interval of varying duration. Months or years may elapse between the attacks. The cataractous and senile types are the most frequent. When the inflammation causes a firm swelling, often sensitive to touch, over which the conjunctiva is freely movable. The overlying conjunctiva is always injected. The infiltration itself at the height of the process is densely vascularized. Seen through the conjunctiva its vessels have a darker, more purplish hue than the superficial ones. The swelling caused by the infiltration gradually subsides, leaving a cicatrix in which the overlying conjunctiva becomes adherent. The cicatrix has a slaty porcellaneous-looking colour. Superficial scleritis occurs in both sexes, particularly in women. The frequency of occurrence varies with the age of the patient. The name of this condition is known. The treatment on the whole is unsatisfactory. Burning down the nodules with the actual cautery, and subsequently a visit to such baths as Harrogate, Buxton, Homburg and Wiesbaden, may be recommended.

Deep scleritis with its attendant complications is altogether a more serious disease. Etio logically it is equally obscure. Both eyes are almost always attacked. It more generally occurs in young people, mostly in young women. Deep scleritis is more persistent and less subject to periods of intermission than episcleritis. The deeper and more widespread inflammatory infiltrations of the sclera lead eventually to weakening of that coat, and cause it to yield to the intra-ocular pressure. Vision suffers from extension of the infiltration to the cornea, or from iritis with its attendant synchiae, or from anterior choroiditis, and sometimes also from secondary glaucoma. The treatment is on the whole unsatisfactory. Iridectomy, especially if done early in the process, may be of use.

The Aqueous Humour.—Intransparency of the aqueous humour is always due to some exudation. This comes either from the round or the ciliary processes, and may be blood, pus or fibrin. An exudation in this situation tends naturally to gravitate to the most dependent part, and, in the case of blood or pus, is known as hyphaema or hypopyon.

The Crystalline Lens Cataract.—Intransparency of the crystalline lens is technically known as cataract. Cataract may be idiopathic and uncomplicated, or traumatic, or secondary to
EYE

DISEASES

disease in the deeper parts of the eye. The modified epithelial structure of which the lens is composed is always being added to throughout life. The older portions of the lens are consequently the more central. They are harder and less elastic. This arrangement seems to predispose to difficulties of nutrition. In many people, in the absence altogether of general or local disease, the transparency of the lens is lost owing to degeneration of the incompletely-nourished fibres. This idiopathic cataract mostly occurs in old people; hence the term senile cataract. So-called senile cataract is not, however, necessarily associated with any general senile changes. An idiopathic unaccompanied cataract is also met with as a congenital defect due to faulty development of the crystalline lens. A particular and not uncommon form of this kind of cataract, which may also develop during infancy, is lamellar or zonular cataract. This is a partial and stationary form of cataract in which, while the greater part of the lens retains its transparency, some of the lamellae are intrasplantar. Traumatic cataract occurs in two ways: by laceration or rupture of the lens capsule, or by nutritional changes consequent upon injuries to the deeper structures of the eye. The transparency of the lens is dependent upon the integrity of its capsule. Penetrating wounds of the eye involving the capsule, or rupture of the capsule from severe blows on the eye without perforation of its coats, are followed by rapidly developing cataract. Severe non-penetrating injuries, which do not cause rupture of the capsule, are sometimes followed, after a time, by slowly-progressing cataract. Secondary cataract is due to abnormalities in the nutrient matter supplied to the lens owing to disease of the ciliary body, choroid or retina. In some diseases, as diabetes, the altered general nutrition tells in the same way on the crystalline lens. Cataract is then rapidly formed. Cases of cataract in diabetes are not, however, necessarily true diabetic cataracts in the above sense. Dislocations of the lens are traumatic or congenital. In old-standing disease of the eye the suspensory ligament may yield in part, and thus lead to lens dislocation. The lens is practically always cataractous before this takes place.

The Vitreous Humour.—The vitreous humour loses its transparency owing to exudation from the inflamed ciliary body or choroid. The exudation may be fibrinous or purulent; the latter only as a result of injuries by which foreign bodies or sepsis have gained access to the eye. The transparency of the lens is dependent upon the integrity of its capsule. Penetrating wounds of the eye involving the capsule, or rupture of the capsule from severe blows on the eye without perforation of its coats, are followed by rapidly developing cataract. Severe non-penetrating injuries, which do not cause rupture of the capsule, are sometimes followed, after a time, by slowly-progressing cataract. Secondary cataract is due to abnormalities in the nutrient matter supplied to the lens owing to disease of the ciliary body, choroid or retina. In some diseases, as diabetes, the altered general nutrition tells in the same way on the crystalline lens. Cataract is then rapidly formed. Cases of cataract in diabetes are not, however, necessarily true diabetic cataracts in the above sense. Dislocations of the lens are traumatic or congenital. In old-standing disease of the eye the suspensory ligament may yield in part, and thus lead to lens dislocation. The lens is practically always cataractous before this takes place.

Diseases of the Iris and Ciliary Body.—Inflammation of the iris, iritis, arises from different causes. The various idiopathic forms have relations to constitutional disturbances such as rheumatism, gout, albuminuria, tuberculosis, fevers, syphilis, gonorrhoea and others, or they may come from cold alone. Traumatic and infected cases are attributable to accidents, the presence of foreign bodies, operations, &c. In addition, iritis may be secondary to keratitis, scleritis or choroiditis. The beginning of an attack of inflammation of the iris is characterized by alterations in its colour due to hyperaemia and by circumcorneal injection. Later on, exudation takes place into the substance of the iris, causing thickening and also a loss of gloss of its surface. According to the nature and severity of the exudation there may be deposits formed on the back of the cornea, attachments between the iris and lens capsule (synchiae), or even gelatinous-looking coagulations or pus in the anterior chamber.

The subjective symptoms to which the inflammation may give rise are dread of light (photophobia), pain, generally most severe at night and often very great, also more or less impairment of sight. Along with the pain and photophobia there is lacrimation. An acute attack of iritis usually lasts about six weeks. Some cases become chronic and last much longer. Others are chronic from the first, and in one clinical type of iritis, in which the ciliary body is also at the same time affected, viz. iritis serosa, there is usually comparatively little injection of the eye or pain, so that the patient’s attention may only be directed to the eye owing to the gradual impairment of sight which results. In some cases, and more particularly in men, there is a tendency to the recurrence at longer or shorter intervals of attacks of iritis (recurrent iritis). In these cases, as well as in all cases of plastic iritis which have not been properly treated, serious consequences to sight are apt to follow from the binding down of the iris to the lens capsule and the occlusion of the pupil by exudation.

Inflammation of the ciliary body, cyclitis, is frequently associated with iritis. This association is probable in all cases where there are deposits on the posterior surface of the cornea. It is certain where there are changes in the intra-ocular tension. Often in cyclitis there is a very marked diminution in tension. Cyclitis is also present when the degree of visual disturbance is greater than can be accounted for by the visible changes in the pupil and anterior chamber. The exudation may, as in cases of iritis, plastic iritis, be remembered the two free surfaces of the ciliary body into the posterior aqueous, and into the vitreous, chambers. This produces, what is a constant sign of cyclitis, more or less intransparency of the vitreous humour. Where there has been excessive exudation into the vitreous, subsequent shrinking and liquefaction take place, leading to detachment of the retina and consequent blindness.

The treatment of iritis necessarily differs to some extent according to the cause. The general treatment applicable to all cases need only be here considered. What should be aimed at, at the time of the inflammation, is to put the eye as far as possible at rest, to prevent the formation of synchiae and alleviate the pain. An attempt should be made to get the pupil thoroughly dilated with atropine. The dilatation should be kept up as long as any circumcorneal injection lasts. If a case of iritis he left to itself or treated without the use of a mydriatic, posterior synchiae almost invariably form. Some fibrinous exudation may even organize into a membrane stretching across, and more or less completely occluding, the pupil. Synchiae, though not of themselves causing impairment of vision, increase the risk that the eye runs from subsequent attacks of iritis, and should however be remembered that as the main call for a mydriatic is to prevent synchiae, the formula d’être for its use no longer exists when, having been begun too late, the pupil cannot properly be dilated by it. Under these conditions it may even do harm. The eyes should also be kept shaded from the light by the use of a shade or neutral-tinted glasses. During an attack any use of the eyes for reading or sewing or work of any kind calling for accommodation must be prohibited. This applies equally to the case of inflammation in one eye alone and in both.

Iritis is best relieved by hot fomentations, cocain, and in many cases the internal use of salicylic or phenacetin. The treatment sometimes required for cases of old iritis is iridectomy. The operation is called for in two different classes of cases. In the former, to improve vision where the pupil is small, and to a great extent occluded, though the condition has not so far led to serious nutritive changes; and in the second place, with the object as well of preventing the complete destruction of vision which either the existing condition or the danger of recurrence of the inflammation has threatened. Iridectomy for iritis should be performed when the inflammation has entirely subsided. The portion of iris excised should be readily recognizable. The operation is urgently called for where the condition of iritis bombans exists.

Iritis tumours, either simple or malignant, are of rare occurrence. A frequent result of a severe blow on the eye is a separation of a portion of the iris from its peripheral attachment (irididysis). Of congenital anomalies the most commonly met with are coloboma and more or less persistence of the foetal pupillary membrane. The most serious form of irido-cyclitis is that which may follow penetrating wounds of the eye. Under certain
conditions this leads to a similar inflammation in the other eye. This so-called sympathetic ophthalmitis is of a malignant type, causing destruction of the sympathizing eye.

The Retina.—Choroidal inflammations are generally patchy, various foci of inflammation being scattered over the choroid. These patches may in course of time become more or less confluent. The effect upon vision depends upon the extent to which the external or periperticular elements of the retina become involved. It is especially serious when the more central portions of the retina are thus affected (choroidal-reinitis centralis).

A peculiar and grave pathological condition of the eye is what is known as glaucoma. A characteristic of this condition is an increase in intra-ocular pressure, or more truly, a deformation of the optic nerve end and its ramifications in the retina. The cause of the rise of tension is partly congestive, partly mechanical. The effect of glaucoma, when untreated, is to cause ever-increasing loss of sight, although the time occupied by the process before it leads to complete blindness varies within such extraordinary wide limits as from a few hours to many years. The uveal tract may be the site of sarcoma.

The retina is subject to inflammation, to detachment from the choroid, to haemorrhages from the blood-vessels and to tumour. Retinal inflammation may primarily affect either the nerve elements or the connective tissue framework. The former is usually associated with some general disease such as albuminuria or diabetes and is bilateral. The tissue changes are oedema, the formation of exudative patches, and haemorrhage. Where the connective tissue elements are primarily affected, the condition is a slow one, similar to sclerosis of the central nervous system. The gradual blindness which this causes is due to compression of the retinal nerve elements by the connective tissue hyperplasia, which is always associated with characteristic changes in the disposition of the retinal pigment. This retinal sclerosis is consequently generally known as retinitis pigmentosa, a disease to which there is a hereditary predisposition. Besides occurring during inflammation, haemorrhages into the retina are met with in phlebitis of the central retinal vein, which is almost invariably unilateral, and in certain conditions of the blood, as pernicious anaemia, when they are always bilateral.

The optic nerve is subject to inflammation (optic neuritis) and atrophy. Double optic neuritis, affecting, however, only the intra-ocular ends of the nerves, is an almost constant accompaniment of brain tumour. Unilateral neuritis has a different causation, depending upon an inflammation, mainly perineuritic, of the connective tissue framework. It is analogous to peripheral inflammation of other nerves, such as the third, fourth, sixth and seventh cranial nerves.

Diseases of the Conjunctiva.—These are the most frequent diseases of the eye with which the surgeon has to deal. They generally lead to more or less interference with the functional activity of the eye and often indeed to great impairment of vision owing to the tendency which there is for the cornea to become implicated.

Many different micro-organisms are of pathogenetic importance in connection with the conjunctiva. Many exist in the normal conjunctival sac. These are mostly bacilli, which are usually not found at any rate a small proportion of others which are known to be pyogenic. This fact is of great importance in connexion both with problems of etiology and the practical question of operations on the eye.

Hyperaemia.—When the conjunctiva becomes hyperaemic its colour is heightened and its transparency lessened. Sometimes too it becomes thickened and its surface altered in appearance. The often marked heightening of colour is due to the very superficial position of the dilated vessels. This is specially the case with that part of the membrane which forms the transition fold between the palpebral and the ocular conjunctiva. Consequently it is there that the redness is most marked, while it is seen to diminish towards the cornea. An important diagnostic mark is thus furnished by purely conjunctival hyperaemia and what is called circumcorneal congestion, which is always an indication of more deep-seated vascular dilatation. It also differs materially from a scleral injection, in which there is a visible dilatation of the superficial scleral vessels.

When a conjunctival hyperaemia has existed for some time the papillae become swollen, and small blebs form on the surface of the membrane: sometimes too, lymph follicles begin to show. The enlargement and compression of adjacent papillae give rise to a velvety appearance of the surface.

Hyperaemia of the conjunctiva where not followed by inflammation causes more or less lacrimation but no alteration in the character of its secretion. The hyperaemia may be acute and transitory or chronic. Much depends upon the cause as well as upon the persistence of the irritation which sets it up.

Purulent conjunctivitis, the presence of foreign bodies in the conjunctival sac, or the irritations of an epidermal chalkey infarcts in the Meibomian ducts, cause more or less severe transitory congestion. Continued subjection to irritating particles such as flour, dust, &c., causes a more continued hyperaemia which is often circumscribed and less pronounced. Bad air in schools, barracks, workhouses, &c., also causes a chronic hyperaemia in which it is common to find a follicular hyperplasia. Long exposure to intense light, astigmatism and other ocular defects which cause ashenopia lead also to chronic hyperaemia. Anaemic individuals are often subject to discomfort from hyperaemia of this nature.

The treatment of conjunctival hyperaemia consists first in the removal of the cause when it can be discovered. Often this is difficult. In addition the application of hot sterilized water is useful and soothing.

Conjunctivitis.—When the conjunctiva is actually inflamed the congested membrane is brought into a condition of heightened secreting action. The secretions become more copious and more or less altered in character. A sufficiently practical though by no means sharply defined clinical division of cases of conjunctivitis is arrived at by taking into consideration the character of the secretion from the inflamed membrane and the visible tissue alterations which the membrane undergoes. Common varieties of conjunctivitis which may thus be distinguished are the following: (a) Catarrhal conjunctivitis, (b) Purulent conjunctivitis, (γ) Phlyctenular conjunctivitis, (δ) Granular conjunctivitis and (ε) Diphtheritic conjunctivitis.

However desirable a truly etiological classification might appear to be, it is doubtful whether such could satisfactorily be made. So much is certain at all events, that not only can identically the same clinical appearance result from the actions of quite different pathogenic organisms, but that various concomitant circumstances may lead to very different clinical signs being set up by one and the same microbe. As regards contagion there is no doubt that the secretion in the case of a true conjunctivitis (i.e. not merely a hyperaemia) is always more or less contagious. The degree of virulence varies not only in different cases, but the effect of contagion from the same source may be different in different individuals. Healthy conjunctivae may thus react differently, not only as regards the degree of severity, but even according to different clinical types, when infected by secretion from the same source. There are no doubt different reasons for this, such as the stage at which the inflammation arrives, the presence of any exudate from which the secretion is derived, differences in the surroundings and in the susceptibility of the infected individuals, the presence of dormant microbes of a virulent type in the healthy conjunctiva which has been infected, &c. Many points in this connexion are very difficult to investigate and much remains to be elucidated. Contagion usually takes place directly and not through the air. Often in this way one eye is first affected and may in some cases, when sufficient care is afterwards taken, be the only one to suffer.

The treatment in all severer forms of conjunctivitis should be undertaken with the primary object in view of preventing any impairment of the cornea.

Catarrhal conjunctivitis, which is characterized by an increased mucoid secretion accompanying the hyperaemia, is usually bilateral and may be either acute or chronic. Acute conjunctivitis lasts as a rule only for a week or two: the chronic type may persist, with or without occasional exacerbations, for
years. The subjective symptoms vary in intensity with the severity of the inflammation. There is always more or less troublesome "burning" in the eyes with a tired heavy feeling in the lids. This is aggravated by reading, which is most distressing in a close or smoky atmosphere and by artificial light. In acute cases, indeed, reading is altogether impossible. In all cases of catarrhal conjunctivitis the symptoms are also more marked if the eyes have been tied up, even though this may produce a temporary relief.

A curious variety of acute catarrhal conjunctivitis, in which the hyperaemia and lacrymation are the predominant features, is the so-called hay-fever. In this condition the mucous membrane of the nose and throat are similarly affected, and there is at the same time more or less constitutional disturbance. Hay-fever is due to irritation from the pollen of many plants, but principally from that of the different grasses. Some people are so susceptible to it that they invariably suffer every year during the early summer months. Here it is difficult to remove the cause, but many cases can be cured and almost all are alleviated by means of a special antitoxin applied locally.

Other exogenous causes of catarrhal conjunctivitis which have been studied are mostly microbial. Of these the most common are the Morax-Axenfeld and the Koch-Weeks conjunctivitis.

The Morax-Axenfeld bacillus sets up a conjunctivitis which affects individuals of all ages and conditions and which is contagious. The inflammation is usually chronic, at most subacute. It is often sufficiently characteristic to be recognized without a microscopical examination of the secretions. In typical cases the lid margin, palpebral conjunctiva, and it may be a patch of ocular conjunctiva at the outer or inner angle are alone hyperemic: the secretion is not copious and is mostly found as a greyish coagulum lying at the inner lid-margin. The subjective symptoms are usually slight. Complications with other varieties of catarrhal conjunctivitis are not uncommon. This mild form of conjunctivitis generally lasts for many months, subject to more or less complete disappearance followed by recurrences. It can be rapidly cured by the use of an oxide of zinc ointment, which should be continued for some time after the appearances have altogether passed off.

The conjunctivitis caused by the Koch-Weeks microbe is still more common. It is a more acute type, affects mostly children, and is very contagious and often epidemic. Here the hyperaemia involves both the ocular and the palpebral conjunctiva, and usually there is considerable swelling of the lids and a copious secretion. Both eyes are always affected. Occasionally the engorged conjunctival vessels give way, causing numerous small extravasations (echymoses). Complications with phlyctenulae (side infra) are common in children. The acute symptoms last for a week or ten days, after which the course is more chronic. Treatment with nitrate of silver in solution is generally satisfactory. Other less frequent microscopic causes of catarrhal conjunctivitis yield to the same treatment.

A form of epidemic mucous-purulent conjunctivitis is not uncommon, in which the swelling of the conjunctival folds and lids is much more marked and the secretions copious. It is less amenable to treatment and also apt to be complicated by corneal ulceration. The microbe which gives rise to this condition has not been definitely established. This inflammation is also known as school ophthalmia. This is extremely contagious, so that isolation of cases becomes necessary. The treatment with antiseptics and local application of 5% iodine and 15% bichloride of mercury is not sufficient, so that new cases are introduced. Special instruments should be used, and the hands should be properly cleansed by a solution of potassium permanganate.

Purulent Conjunctivitis.—Some of the severer forms of catarrhal conjunctivitis are accompanied not only by a good deal of swelling of both conjunctiva and lids but also by a decidedly muco-purulent secretion. Nevertheless there is a sufficiently sharply-defined clinical difference between the catarrhal and purulent types of inflammation. In purulent conjunctivitis the oedema of the lids is always marked, often excessive, the hyperaemia of the whole conjunctiva is intense: the membrane is also infiltrated and swollen (chemosis), the papillae enlarged and the secretion almost wholly purulent. Although this variety of conjunctivitis is principally due to infection by gonococci, other microbes, which more frequently set up a catarrhal type, may lead to the purulent form.

All forms are contagious, and transmission of the secretion to other eyes usually sets up the same type of severe inflammation. The way in which infection mostly takes place is by direct transference by means of the hands, towels, &c., of secretions containing gonococci either from the eye or from some other mucous membrane. The poison may also sometimes be carried by flies. The dried secretion loses its virulence.

In new-born children (ophthalmitis neonatorum) infection takes place from the maternal passages during birth. Notwithstanding the great changes which occur during the progress of a purulent conjunctivitis, there is on recovery a complete restitutio ad integrum so far as the conjunctiva is concerned. Owing to the tendency to severe ulceration of the cornea, more or less serious destruction of that membrane, and consequently more or less interference with sight, may result before the inflammation has passed off. This is a special danger in the case of adults. For this reason when only one eye is affected the first point to be attended to in the treatment is to secure the second eye from contagion by efficient occlusion. The appliance known as Buller's shield, a watch-glass strapped down by plaster, is the best for this purpose. It not only admits of the patient seeing with the sound eye, but allows the other to remain under direct observation. The treatment otherwise consists in frequent removal of the secretions from the affected eye and the use of nitrate of silver solution as a bactericide applied directly to the conjunctival surface; sometimes it is necessary to cut away the chemic conjunctiva immediately surrounding the cornea. When the cornea has become affected efforts may be made with the thermo-cautery or otherwise to limit the area of destruction and thus admit of something being done to improve the vision after all inflammation has subsided. The greatest cleanliness as well as proper antiseptic precautions should of course be observed by every one in any way connected with the treatment of such cases.

Purulent conjunctivitis is an acute inflammation of the ocular conjunctiva, in which small blebs or phlyctenules form, more particularly in the vicinity of the corneal margin, as well as on the epithelial continuation of the conjunctiva which covers the cornea. The inflammation is characterized by being distributed in little circumscribed foci and not diffused as in all other forms of conjunctivitis. In it the conjunctival secretion is not altered, unless there should exist at the same time a complication with some other form of conjunctivitis. This condition is most frequent in children, particularly such as are ill-nourished or are recovering from some illness, e.g. measles. The susceptibility occurs in fact mainly where there exists what used to be called a "strumous" diathesis. In many cases, therefore, there is some kind of tubercular basis for the manifestations. This basis has to do with the susceptibility only, at all events to begin with. The local changes are not tuberculous; their exact origin has not been clearly established. They are in all probability produced by staphylococci.

Many children suffering from phlyctenular conjunctivitis get after a short time an eczematous excoriation of the skin of the nostrils. This excoriated, scabby area contains crowds of staphylococci and bacilli which, when the copious teardrop flow down the nostrils has excoriated and irritated the skin. Lacrymation is indeed a very common concomitant of phlyctenular conjunctivitis. Another frequently distressing symptom is a pronounced dread of light (photophobia), which often leads to convulsive and very persistent closing of the lids (blepharon spasms). Indeed the relief of the photophobia is often the most important point to be considered in the treatment of phlyctenular conjunctivitis. The photophobia may be very severe when the local changes are slight. The eyes should be shaded but not bandaged. Cocain may be freely used. The best
local application is the yellow oxide of mercury used as an ointment.

Phlyctenular conjunctivitis, and the corneal complications with which it is so often associated, constitute a large proportion (from $\frac{1}{2}$ to $\frac{3}{4}$) of all eye affections with which the surgeon has to deal.

Granular Conjunctivitis.—This disease, which also goes by the name of trachoma, is characterized by an inflammatory infiltration of the adenoid tissue of the conjunctiva. The inflammation is accompanied by the formation of so-called granules, and at the same time by a hyperplasia of the papillae. The changes further lead in the course of time to cicatricial transformations, so that a gradual and progressive atrophy of the conjunctival results. The disease takes its origin most frequently in the conjunctival fold of the upper lid, but eventually as a rule involves the cornea and the deeper tissues of the lid, particularly the tarsus.

The etiology of trachoma is unknown. Though a perfectly distinctive affection when fully established, the differential diagnosis from other forms of conjunctivitis, particularly those associated with much follicular enlargement or which have begun as purulent inflammation, may be difficult. Trachoma is mostly chronic. When occurring in an acute form it is more amenable to treatment and less likely to end in cicatricial changes. Fully half the cases of trachoma which occur are complicated by pannus, which is the name given to the affection when it has spread to the cornea. Pannus is a superficial vascularized infiltration of the cornea. The veiling which it produces causes more or less defect of sight.

Various methods of treatment are in use for trachoma. Expression by means of roller-forces or repeated gratting are amongst the more effective means of surgical treatment, while local applications of copper sulphate or of alum are certainly useful in suitable cases.

Diphtheritic conjunctivitis is characterized by an infiltration into the conjunctival tissues which, owing to great coagulability, rapidly interferes with the nutrition of the invaded area and thus leads to necrosis of the diphtheritic membrane. Conjunctival diphtheria may or may not be associated with diphtheria of the throat. It is essentially a disease of early childhood, not more than $10\%$ of all cases occurring after the age of four. The cornea is exposed to great risk, more particularly during the first few days, and may be lost by necrosis. So frequent ulceration is not uncommon, but may often be arrested before complete destruction has taken place.

The disease is generally confined to one eye, and complicated by swelling of the preauricular glands of that side. It may prove fatal. In true conjunctival diphtheria the exciting cause is the Klebs-Löffler bacillus. The inflammation occurs in very varying degrees of severity. The secretion is at first thin and scant, afterwards purulent and more copious. In severe cases there is great chemosis with much tense swelling of the lids, which are often of an ashy-grey colour. A streptococcus infection produces somewhat similar and often quite as disastrous results.

Local applications of tincture of borax, boric acid, antitoxin and local with antiseptics. Of rarer forms of conjunctivitis may be mentioned Parinaud's conjunctivitis and the so-called spring catarrh.

Non-inflammatorv Conjunctival Afections.—These are of less importance than conjunctivitis, either on account of their comparative infrequency or because of their harmlessness. The following conditions may be shortly referred to.

Amyloid degeneration, in which waxy-looking masses grow from the palpebral conjunctiva of both lids, often attaining very considerable dimensions. The condition is not uncommon in China and elsewhere in the East.

Essential Shrinking of the Conjunctiva.—This is the result of pemphigus, in which the disease has attacked the conjunctiva and led to its atrophy.

Pterygium is a hypertrophic thickening of the conjunctiva of triangular shape firmly attached by its apex to the superficial layers of the cornea. It is a common condition in warm climates owing to exposure to sun and dust, and often calls for operative interference.

Tumours of the Conjunctiva.—These may be malignant or benign, also syphilitic and tubercular. (G. A. Biz.)

EYEMOUTH, a police burgh of Berwickshire, Scotland. Pop. (1901) 2436. It is situated at the mouth of the Eye, 71 m. N.N.W. of Berwick-on-Tweed by the North British railway via Burnmouth. Its public buildings are the town hall, library and masonic hall. The main industry is the fishing and allied trades. The harbour was enlarged in 1887, and the bay is easily accessible and affords good anchorage. Owing to the rugged situation, barges are used for landing coal, and the inner road to the town is often obstructed by high seas. The whole district was once infested with smugglers. The promontory of St Abb's Head is 3 m. to the N.W.

EYLAU (Preussisch-Eylau), a town of Germany, in east Prussia, on the Pasmar, 23 m. S. by E. of Königsberg by rail on the line Pillau-Prostken. It has an Evangelical church, a teachers' seminary, a hospital, fountains and saw mills. Pop. 3200. Eylau was founded in 1336 by Arnolf von Ellenstein, a knight of the Teutonic Order. It is famous as the scene of a battle between the army of Napoleon and the Russians and Prussians commanded by General Bennigsen, fought on the 8th of February 1807.

The battle was preceded by a severe general engagement on the 7th. The head of Napoleon's column (cavalry and infantry), advancing from the south-west, found itself opposed at the outlet of the Grünhöfchen defile by a strong Russian rearguard which held the (frozen) lakes on either side of the Eylau road, and attacked at once, dislodging the enemy after a sharp conflict. The French turned both wings of the enemy, and Bagration, who commanded the Russian rearguard, retired through Eylau to the main army, which was now arrayed for battle east of Eylau. Barclay de Tolly made a strenuous resistance in Eylau itself, and in the churchyard, and these local engagements changed hands several times before remaining finally in possession of the French. It is very doubtful whether Napoleon actually ordered this attack upon Eylau, and it is suggested that the French soldiers were encouraged to a premature assault by the hope of obtaining quarters in the village. There is, however, no reason to suppose that this attack was prejudicial to Napoleon's chance of success, for his own army was intended to pin the enemy in front, while the outlying "masses of manoeuvre" closed upon his flanks and rear (see NAPOLEONIC CAMPAIGNS). In this case the vigour of the "general advance guard" was superfluous, for Bennigsen stood to fight of his own free will.

The foremost line of the French bivouacs extended from Rothenen to Freibiert, but a large proportion of the army spent the night in quarters farther back. The Russian army on the other hand spent the night bivouacked in order of battle, the right at Schloditten and the left at Serpallen. The cold was extreme, 2° F. being registered in the early morning, and food was scarce in both armies. The ground was covered at the time of battle with deep snow, and all the lakes and marshes were frozen, so that troops of all arms could pass everywhere, so far as were the Russian troops. Napoleon's corps (Davout and Ney) were still absent, and Ney did not receive his orders until the morning of the 8th. His task was to descend upon the Russian right, and also to prevent a Prussian corps under Lestocq from coming on to the battlefield. Davout's corps advancing from the south-east on Mollwitten was destined for the attack of Bennigsen's left wing about Serpallen and Klein Sausgarten. In the meantime Napoleon with his forces at and about Eylau made the preparations for the frontal attack. His infantry extended from the windmill, through Eylau, to Rothenen, and the artillery was deployed along the whole front; behind each infantry corps and on the wings stood the cavalry. The Guard was in second line south of Eylau, and an army reserve stood near the Waschkeiten lake. Bennigsen's army was drawn up in line from Schloditten to Klein Sausgarten, the front likewise covered by guns, in which arm he was numerically much superior. A detachment occupied Serpallen.

The battle opened in a dense snowstorm. About 8 A.M.
Bennigsen's guns opened fire on Eylau, and after a fierce but undecided artillery fight the French delivered an infantry attack from Eylau. This was repulsed with heavy losses, and the Russians advanced towards the windmill in force. Thereupon Napoleon ordered his centre, the VII. corps of Augéreau, to move forward from the church against the Russian front, the division of St Hilaire on Augéreau's right participating in the attack.

If we conceive of this first stage of the battle as the action of the 'general advanced guard,' Augéreau must be held to have overdone his part. The VII. corps advanced in dense masses, but in the fierce snowstorm lost its direction. St Hilaire attacked directly and unsuported; Augéreau's corps was still less fortunate. Crossing obliquely the front of the Russian line, as if making for Schloßitten, it came under a feu d'enfer and was practically annihilated. In the confusion the Russian cavalry charged with the utmost fury downhill and with the wind behind them. Three thousand men only out of about fourteen thousand appeared at the evening parade of the corps. The rest were killed, wounded, prisoners or dispersed. The marshal and every senior officer was amongst the killed and wounded, and one regiment, the 14th of the Line, cut off in the midst of the Russians and refusing to surrender, fell almost to a man. The Russian counterstroke penetrated into Eylau itself and Napoleon himself was in serious danger. With the utmost coolness, however, he judged the pace of the Russian advance and ordered up a battalion of the Guard at the exact moment required. In the streets of Eylau the Guard had the Russians at their mercy, and few escaped. Still the situation for the French was desperate, and the battle had to be maintained at all costs. Napoleon now sent forward the cavalry along the whole line. In the centre the charge was led by Murat and Bessières, and the Russian horsemen were swept off the field. The Cuirassiers under D'Hautpoul charged through the Russian guns, broke through the first line of infantry and then through the second, penetrating to the woods of Anklappen.

The shock of a second wave of cavalry broke the lines again, and though in the final retirement the exhausted troops lost their direction, they had achieved their object. The wreck of Augéreau's and other divisions had been reformed, the Guard brought up into first line, and, above all, Davout's leading troops had occupied Serpallen. Thence, with his left in touch with Napoleon's right (St Hilaire), and his right extending gradually towards Klein Sausgarten, the marshal pressed steadily upon the Russian left, rolling it up before him, until his right had reached Kutschitten and his centre Anklappen. By that time the troops under Napoleon's immediate command, pivoting their left on Eylau church, had wheeled gradually inward until the general line extended from the church to Kutschitten. The Russian army was being driven westward, when the advance of Lestocq gave them fresh steadiness. The Russian corps had been fighting a continuous flank-guard action against Marshal Ney to the north-west of Althof, and Lestocq had finally succeeded in disengaging his main body, Ney being held up at Althof by a small rearguard, while the Prussians, gathering as they went the fugitives of the Russian army, hastened to oppose Davout. The impetus of these fresh troops led by Lestocq and his staff officers and the breakthrough was such as to enable even the famous divisions of Davout's corps which had won the battle of Auerstädt single-handed. The French were now gradually forced back until their right was again at Sausgarten and their centre on the Kreege Berg.

Both sides were now utterly exhausted, for the French also had been marching and fighting all day against Ney. The battle died away at nightfall, Ney's corps being unable effectually to intervene owing to the steadiness of the Russian detachment left to oppose him, and the extreme difficulty of the roads. A severe conflict between the Russian extreme right and Ney's corps occurred at last but appeared on the field at Schloßitten ended the battle. Bennigsen retreated during the night through Schmolitten, Lestocq through Kutschitten. The numbers engaged in the first stage of the battle may be taken as—Napoleon, 50,000, Bennigsen, 57,000, to which later were added on the one side Ney and Davout, 20,000, on the other Lestocq, 7000. The losses were roughly, 15,000 men to the French, 18,000 to the Allies, or 21 and 27% respectively of the troops actually engaged. The French lost 5 eagles and 7 other colours, the Russians 16 colours and 2 guns.

**EYRA (Felix eyra), a South American wild cat, of weasel-like build, and uniform coloration, varying in different individuals from reddish-yellow to chestnut. It is found in Brazil, Guiana and Paraguay, and extends its range to the Rio del Norte, but is rare north of the isthmus of Panama. Little is known of its habits in a wild state, beyond the fact that it is a forest-dweller, active in movement and fierce in disposition. Several have been exhibited in the London Zoological Gardens, and some have grown gentle in captivity. Don Felix de Araza wrote of one which he kept on a chain that it was "as gentle and playful as any kitten could be." The name is sometimes applied to the jaguarundi.**

**EYRE, EDWARD JOHN (1815–1901), British colonial governor, the son of a Yorkshire clergyman, was born on the 5th of August 1815. He was intended for the army, but delays having arisen in producing a commission, he went out to New South Wales, where he engaged in the difficult but very necessary undertaking of transporting stock westward to the new colony of South Australia, then in great distress, and where he became magistrate and protector of the aborigines, whose interests he warmly advocated. Already experienced as an Australian traveller, he undertook the most extensive and difficult journeys in the desert country north and west of Adelaide, and after encountering the greatest hardships, proved the possibility of land communication between South and West Australia. In 1845 he returned to England and published the narrative of his travels. In 1846 he was appointed lieutenant-governor of New Zealand, where he served under Sir George Grey. After successively governing St Vincent and Antigua, he was in 1862 appointed acting-governor of Jamaica and in 1864 governor. In October 1865 a negro insurrection broke out and was repressed with laudable vigour, but the unquestionable severity and alleged illegality of Eyre's subsequent proceedings raised a storm at home which induced the government to suspend him and to despatch a special commission of investigation, the effect of whose inquiries, declared by his successor, Sir John Peter Grant, to have been "admirably conducted," was that he should not be reinstated in his office. The government, nevertheless, saw nothing in Eyre's conduct to justify legal proceedings; indictments preferred by amateur prosecutors at home against him and military officers who had acted under his direction, resulted in failure, and he retired upon the pension of a colonial governor. As an
EYRE, SIR J. [EZEKIEL]

explorer Eyre must be classed in the highest rank, but opinions are always likely to differ as to his action in the Jamaica rebellion. He died on the 30th of November 1801.

EYRE, SIR JAMES (1734-1790), English judge, was the son of the Rev. Thomas Eyre, of Wells, Somerset. He was educated at Winchester College and at St John's College, Oxford, which, however, he left without taking a degree. He was called to the bar at Gray's Inn in 1755, and commenced practice in the lord mayor's and sheriffs' courts, having become by purchase one of the fourteen counsel to the corporation of London. He was appointed recorder of London in 1753. He was counsel for the plaintiff in the case of Wilkes v. Wood, and made a brilliant speech in condemnation of the execution of general search warrants. His refusal to voice the remonstrances of the corporation against the exclusion of Wilkes from parliament earned him the recognition of the ministry, and he was appointed a judge of the exchequer in 1772. From June 1792 to January 1793 he was chief commissioner of the great seal. In 1793 he was made chief justice of the common pleas, and presided over the trials of Horne Tooke, Thomas Crosfield and others, with great ability and impartiality. He died on the 1st of July 1799 and was buried at Ruscombe, Berkshire.

EYRIE, the alternative English form of the words Aerie or Aery, the lofty nest of a bird of prey, especially of an eagle, hence any lofty place of abode; the term is also used of the brood of the bird. The word derives from the Fr. aere, of the same meaning, which comes from the Lat. area, an open space, but was early connected with abrius, high in the air, airy, a confusion that has affected the spelling of the word. The forms "eairy" or "eeyr" date from the 17th century attempt to derive the word from the Teutonic eot, an egg.

EZEKIEL (עֵץֵקֵיאֵל, "God strengthens" or "God is strong"); Sept. [에זkład], Vulg. Ezechiel, son of Buzi, one of the most vigorous and impressive of the older Israelite thinkers. He was a priest of the Jerusalem temple, probably a member of the dominant house of Zadok, and doubtless had the literary training of the cultivated priesthood of the time, including acquaintance with the national historical, legal and ritual traditions and with the contemporary history and customs of neighbouring peoples. In the year 597 (being then, probably, not far from thirty years of age) he was carried off to Babylonia by Nebuchadrezzar with King Jehoiachin and a large body of nobles, military men and artisans, and there, it would seem, he spent the rest of his life. His prophecies are dated from this year ("our captivity," xl. 1), except in i. 1, where the meaning of the date "thirtieth year" is obscure; it cannot refer to his age (which would be otherwise expressed in Hebrew), or to the reform of Josiah, 621 (which is not elsewhere employed as an epoch); possibly the reference is to the era of Nabopolassar (626 according to the Canon of Ptolemy), if chronological inexactness be supposed (10th or 11th century instead of 39), a supposition not at all improbable. That the word "thirtieth" is old, appears from the fact that a scribe has added a gloss (vv. 2, 3) to bring this statement into accord with the usual way of reckoning in the book: the "thirtieth" year, he explains, is the fifth year of the captivity of Jehoiachin. The exiles dwelt at Tell-abib ("Hill of the flood"), one of the mounds or ruins made by the great floods that devastated the country,1 near the "river" Chebar (Kharb), probably a large canal not far south of the city of Babylon. Here they had their own lands, and some form of local government by elders, and appear to have been prosperous and contented; probably the only demand made on them by the Babylonian government was the payment of taxes.

Ezekiel was married (xxiv. 18), had his own house, and comported himself quietly as a Babylonian subject. But he was a profoundly interested observer of affairs at home and among the exiles; as patriot and ethical teacher he deplored alike the political blindness of the Jerusalem government (King Zedekiah revolted in 588) and the immorality and religious superficiality and apathy of the people. He, like Jeremiah, was friendly to Nebuchadrezzar, regarding him as Yahweh's instrument for the chastisement of the nation. Convinced that opposition to Babylonian rule was suicidal, and interpreting historical events, in the manner of the times, as indications of the temper of the deity, he held that the imminent political destruction of the nation proved of Yahweh's anger with the people on account of their moral and religious depravity; Jerusalem was hopeless corrupt and must be destroyed (xxiv.). On the other hand, he was equally convinced that, as his predecessors had taught (Hos. xi. 8; Isa. viii. 3 al.), Yahweh's love for his people would not suffer them to perish utterly—a remnant would be saved, and this remnant he naturally found in the exiles in Babylonia, a little band plucked from the burning and kept safe in a foreign land till the wrath should have passed (xi. 14 ff.). This conception of the exiles as the kernel of the restored nation he further set forth in the great vision of ch. i., in which Yahweh is represented as coming to Jerusalem and coming to take up his abode among them in Babylonia for a time, intending, however, to return to his own city (xliii. 7).

This, then, was Ezekiel's political creed—destruction of Jerusalem and its inhabitants, restoration of the exiles, and meantime submission to Babylon. His arraignment of the Judeans is violent, almost malignant. vi. xvi. al.). Thewell-meaning but weak king Zedekiah he denounces with bitter scorn as a perfurred traitor (xxvii.). He does not discuss the possibility of successful resistance to the Chaldeans; he simply assumes that the attempt is foolish and wicked, and, like other prophets, he identifies his political programme with the will of God. Probably his judgment of the situation was correct; yet, in view of Sennacherib's failure at Jerusalem in 701 and of the admitted strength of the city, the hope of the Jewish nobles could not be considered wholly unfounded, and in any case their patriotism (like that of the national party in the Roman siege) was not unworthy of admiration. The prophet's predictions of disaster continued, according to the record, up to the investment of the city by the Chaldean army in 588 (i. xxiv.); after the fall of the city (586) his tone changed to one of consolation (xxiii.-xxix. the destruction of the wicked has been accomplished, having turned to the task of reconstruction. He describes the safe and ample city of his own land, and gives a sketch of a new constitution, of which the main point is the absolute control of public religion by the priesthood (xl.-xlvi.).

The discourses of the first period (i.-xxiv.) do not confine themselves to political affairs, but contain much interesting ethical and religious material. The picture given of Jerusalemite morals is an appalling one. Society is described as honeycombed with crimes and vices; prophets, priests, princes and the people generally are said to practise unblushingly extortion, oppression, murder, falsehood, adultery (xxii.). This description is doubtless exaggerated. It may be assumed that the social corruption in Jerusalem was such as is usually found in wealthy communities, made bolder in this case, perhaps, by the political unrest and the weakness of the royal government under Zedekiah. No such charges are brought by the prophet against the exiles, in whose simple life, indeed, there was little or no opportunity for flagrant violation of law. Ezekiel's own moral code is that of the prophets, which insists on the practice of the fundamental civic virtues. He puts ritual offences, however, in the same category with offences against the moral law, and he does not distinguish between immorality and practices that are survivals of old recognized customs: in ch. xxii. he mentions "eating with the blood" along with murder, and failure to observe ritual regulations along with oppression of the fatherless and the widow; the old customary law permitted marriage with a half-sister (father's daughter), with a daughter-in-law, and with a father's wife (Gen. xx. 12, xxxviii. 26; 2 Sam. xvi. 21, 22), but the more refined

1 The Assyrian term abušu is used of the great primeval deluge (in the Gilgamesh epic), and also of the local floods common in the country.

2 So we must read (as Robertson Smith has pointed out) in xxii. 9 and xviii. 6, instead of "eating on the mountains."
feeling of the later time frowned on the custom, and Ezekiel treats it as adultery.\(^1\) However, notwithstanding the insistence on ritual, natural in a priest, his moral standard is high; following the prescription of Ex. xxii. 21 (20) he regards oppression of resident aliens (a class that had not then received full civil rights) as a crime (xxii. 2), and in his new constitution (xvii. 22, 23) gives them equal rights with the homeborn. His strongest denunciation is directed against the religious practices of the time in Judaea—the worship of the Canaanite local deities (the Baals), the Phoenician Tammuz, and the sun and other Babylonian and Assyrian gods (vi., viii., xvi., xxiii.); he maintained vigorously the prophetic struggle for the sole worship of Yahweh. Probably he believed in the existence of other gods, though he does not express himself clearly on this point; in any case he held that the worship of other deities was destructive to Israel. His conception of Yahweh shows a mingling of the high and the low. On the one hand, he regards him as supreme in power, controlling the destinies of Babylonia and Egypt as well as those of Israel, and as inflexibly just in dealing with ordinary affairs against morality. But he conceives of him, on the other hand, as limited locally and morally—as having his special abode in the Jerusalem temple, or elsewhere in the midst of the Israelite people, and as dealing with other nations solely in the interests of Israel. The bitter invectives against Ammon, Moab, Edom, Philistia, Tyre, Sidon and Egypt, put into Yahweh’s mouth, are based wholly on the fact that these peoples are regarded as hostile and hurtful to Israel; Babylonia, though nowise superior to Egypt morally, is favoured and applauded because it is believed to be the instrument for securing ultimately the prosperity of Yahweh’s people. The administration of the affairs of the world by the God of Israel is represented, in a word, as determined not by ethical considerations but by personal preferences. There is no hint in Ezekiel’s writings of the grandiose conception of Isa. xi.-lv., that Israel’s mission is to give the knowledge of religious truth to the other nations of the world; he goes so far as to say that Yahweh’s object in restoring the fortunes of Israel is to establish his reputation among the nations as a powerful deity (xxxvi. 20-23, xxxvii. 28, xxxix. 23). The prophet regards Yahweh’s administrative control as immediate: he intercedes no angels or other subordinate agents—the cherubs and the “men” of ix. 2 and x. 3 are merely imaginative symbols or representations of divine activity. His high conception of God’s transcendence, it may be supposed, led him to ignore intermediary agencies, which are common in the popular literature, and later, under the influence of this same conception of transcendence, are freely employed.

The relations between the writings of Ezekiel and those of Jeremiah is not clear. They have so much in common that they must have drawn from the same current bodies of thought, or there must have been borrowing in one direction or the other. In one point, however,—the attitude toward the ritual—the two men differ radically. The finer mind of the nation, represented mainly by the prophets from Amos onward, had denounced unswervingly the superficial non-moral popular cult. The struggle between ethical religion and the current worship became acute toward the end of the 7th century. There were two possible solutions of the difficulty. The ritual books of our Pentateuch were not then in existence, and the sacrificial cult might be treated with contempt as not authoritative. This is the course taken by Jeremiah, who says boldly that God requires only obedience (Jer. vii. 21 ff.). On the other hand, the better party among the priests, believing the ritual to be necessary, might undertake to moralize it; of such a movement, begun by Deuteronomy, Ezekiel is the most eminent representative. Priest and prophet, he sought to unify the national religious consciousness by preserving the sacrificial cult, discarding its abuses and vitalizing it ethically. The event showed that he judged the situation rightly—the religious scheme announced by him, though not accepted in all its details, became the dominant policy of the later time, and he has been justly called “the father of Judaism.” He speaks as a legislator, citing no authority; but he formulates, doubtless, the ideas, and perhaps the practices of the Jerusalem priesthood. His ritual code (xiii.-xlii.), which in elaborateness stands midway between that of Deuteronomy and that of the middle books of the Pentateuch (resembling most nearly the code of Lev. xvii.-xxvi.) shows good judgment. Its most noteworthy features are two. Certain priests of idolatrous Jewish shrines (distinguished by him as “Levites”) he deprives of priestly functions, degrading them to the rank of temple menials; and he takes from the civil ruler all authority over public religion, permitting him merely to furnish material for sacrifices. He is, however, much more than a ritual reformer. He is the first to express clearly the conception of a sacred nation, isolated by its religion from all others, the guardian of divine law and the abode of divine majesty. This kingdom of God he conceives of as moral: Yahweh is to put his own spirit into the people,\(^2\) creating in them a disposition to obey his commandments, which are moral as well as ritual (xxxvi. 26, 27). The conception of a sacred nation controlled the whole succeeding Jewish development; if it was narrow in its exclusive regard for Israel, its intensity saved the Jewish religion to the world.

**Text and Authorship.**—The Hebrew text of the book of Ezekiel is not in good condition—it is full of scribal inaccuracies and additions. Many of the errors may be corrected with the aid of the Septuagint (e.g. the 430—390-40 of iv. 5, 6 is to be changed to 190), and none of them affect the general thought. The substantial genuineness of the discourses is now accepted by almost all scholars; and it is not probable that the prophet’s “paras” is our “Persia.” Havet’s contention (in *La Modernité des prophètes*) that Gog represents the Parthians (40 n.c.) has little or nothing in its support. There are additions made *post eventum*, as in the case mentioned above and in xxix. 17-20, and the description of the commerce of Tyre (xxvii. 9b-25a), which interrupts the comparison of the city to a ship, looks like an insertion whether by the prophet or by some other; but there is no good reason to doubt that the book is substantially the work of Ezekiel. Ezekiel’s style is generally impetuous and vigorous, somewhat smoother in the consolations and promises (xxxvi., xxxvi., xxxvii., xxxviii.); he produces a great effect by the cumulation of details, and is a master of invective; he is fond of symbolic pictures, proverbs and allegories; his “visions” are elaborate literary productions, his prophecies show less spontaneity than those of any preceding prophet (he receives his revelations in the form of a book, ii. 9), and in their present shape were hardly pronounced in public—a fact that seems to be hinted at in the statement that he was “dumb” till the fall of Jerusalem (iii. 26, xxxiii. 22); in private interviews the people did not take him seriously (xxxiii. 30-33). His book was accepted early as part of the sacred literature. Ben-Sira (c. 180 B.C.) mentions it along with Isaiah and Jeremiah (Eccles. xlix. 8); he is not quoted directly in the New Testament, but his imagery is employed largely in the Apocalypse and elsewhere. His divergences from the Pentateuchal code gave rise to serious doubts, but, after prolonged study, the discrepancies were explained, and the book was finally canonized (Shab. 130). According to 2 Yahweh’s spirit, thought of as Yahweh’s vital principle, as man’s spirit is man’s vital principle, is to be breathed into them, as, for instance, when Yahweh breathes life into the likeness of Adam. The spirit in the Old Testament is a refined material thing that may come or be poured out on men.\(^3\) The “Great Synagogue” is semi-mythical.

---

\(^1\) The stricter marriage law is formulated in Lev. xviii. 8-15, xx. 11 ff.

\(^2\) Yahweh’s spirit, thought of as Yahweh’s vital principle, as man’s spirit is man’s vital principle, is to be breathed into them, as, for instance, when Yahweh breathes life into the likeness of Adam. The spirit in the Old Testament is a refined material thing that may come or be poured out on men.

\(^3\) The "Great Synagogue" is semi-mythical.
The book divides itself naturally into three parts: the arrangement of Jerusalem (i–xxiv.); denunciation of foreign enemies (xxv–xxxii.); consolatory construction of the future (xxxiii.–xxxviii.). The opening "vision" (i.), an elaborate symbolic picture, is of the nation's future, and of the prophet's death, which is probably symbolized, as a sapphire throne (cf. Ex. xxiv. 10), and on the throne a man-like form (Yahweh) surrounded by a rainbow brightness. The wheels symbolize divine omniscience and control, and the whole vision represents the coming of Yahweh to take up his abode among his exiles. The prophet then receives his call (ii., iii.) in the shape of a roll of a book, which he is required to eat (an indication of the literal form now taken by prophecy). He is informed that the people are wandering and self-seeking; that he will interpret his opinion of the people, and gives the keynote of the following discourses; he is appointed watchman to warn men when they sin, and is to be held responsible for the consequences of his watchfulness. These words, the connexion of a preacher's function, the prophet was faithful throughout his career. Next follow minatory discourses (iv.–vii.) predicting the siege and capture of Jerusalem—perhaps resulting from a similar event, and giving a vivid picture of the siege. One of these (iv. 4 ff.) gives the duration of the national punishment in loose chronological reckoning: 40 years (a round number) for Judah, and 150 more (according to the context) for Israel, with the addition of the year 722, the date of the capture of Samaria; the procedure described in vi. 8 is not to be understood literally. In vi. the idolatry of the nation is pictured in darkest colours. Next follows (viii.–x.) a denunciation of the desolation in the form of a vision; the earth which within the temple-area elders and others are worshipping beast-forms, Tammuz and the sun (probably actual cults of the time); men worshiping the temple as a city (lx.). In ch. x. the imagery of ch. i. reappears, and the Creatures are identified with the cherubs of Solomon's temple. This appears to be an independent form of the vision, which has been brought into connexion with that of i. by a harmonizing editor. There follow a symbolic prediction of the exile (xii.) and a denunciation of non-moral prophets and prophetesses (xiii.);—though Yahweh delivers a prophet, he yet and those who consult him will be punished; and a denunciation of all that is debased and distasteful to God in his good men will not save it (xiv.). After a comparison of Israel to a worthless wild vine (xv.) come two allegories, one portraying idolatry as the uprooting of the vine, the other describing the fate of Zedekiah (xvii.). The fine insistence on individual moral responsibility in xvii. (cf. Dout. xxiv. 16, Jer. xxxi. 29 f.), while it is a protest against a superficial current view, is impressed with ethical force, which may have determined a descent into death. This latter question had not presented itself to the prophet's mind; his object was simply to correct the opinion of the people that their present misfortunes were due not to their own faults but to those of their predecessors. A more sympathetic attitude appears in two elegies (xxi.), one on the kings Jehoahaz and Jehoiachin, the other on the nation. These are followed by a scathing sketch of Israel's religious institutions (xx. 12–25), contrary to the view of earlier prophets, it is declared that the nation had always been disobedient. From this point to the xxviii. there is a mingling of threat and promise. The allegory of the vine (xxiv. 1–27) is the main theme of xvii. in the latter part of the chapter, which is relatively treated with favour, while in the former it is involved in the same condemnation as that of Jerusalem. At this point is introduced (xxv.–xxvi.) the series of discourses directed against the vicinity. The description of the temple (xxvi. 11–19) as dwelling in Eden, the garden of God, the sacred mountain, under the protection of the cherub, bears a curious resemblance to the narrative in Gen. ii., ii., of which, however, it seems to be dependent, using different Babylonian material; the text is corrupt. The section dealing with Egypt is one of remarkable imaginative power and rhetorical vigour: the king of Egypt is compared to a magnifying glass; the second man is "the great sea* (in Lebanon) and to the dragon of the Nile, and the picture of his

1 In vii. 17 the unintelligible expression "they put the branch to their nose" is the rendering of a corrupt Hebrew text; a probable emendation is: "they are sending a stitch to my nostrils.

2 For a reconstruction of the poem in xxvi. 10, 11, see the English Ezekiel in Hawk's Sacred Books.

3 Described by Daniel (xii. 14) is later taken by the author of the book of Daniel as his hero.

4 Ezekiel is spoken of by many critics as a "Sphinian" of the apocalyptic books, but as a whole the book is not a "Book of the Cultus," as it is often termed. The word "apocalyptic" is used here in a wide sense, indicating an intense and mysterious effort to describe the future, as it is believed, and to find a possible justification for the present suffering of the Jews. The book is divided into two main parts: the first part, consisting of the visions and prophecies, deals with the destruction of Jerusalem and the fall of Babylon, and the second part, consisting of the ethical and moral teachings, deals with the restoration and the future of the Jews. The book is characterized by a vivid and imaginative language, and by a strong emphasis on the divine nature of the prophet and the divine nature of the nation. The book is also notable for its use of the language and literature of the time, and for its use of the language and literature of the future.
onwards designate this book as 1 Esdras, the canonical books Ezra and Nehemiah being 2 Esdras in the Greek. In the Vulgate, however, our author was, through the action of Jerome, degraded into the third place and called 3 Esdras, whereas the canonical books Ezra and Nehemiah (see Ezra and Nehemiah, Books of, below) were called 1 and 2 Esdras, and the Apocalypse of Ezra 4 Esdras. Thus the nomenclature of our book follows, and possibly wrongly, the usage of the Vulgate. 1 In the Ethiopic version a different usage prevails. The Apocalypse is called 1 Esdras, our author 2 Esdras, and Ezra and Nehemiah 3 Esdras, or 3 and 4 Esdras. Throughout this article we shall use the best available designation of this book, i.e. 1 Esdras.

Contents.—With the exception of one original section, namely, that of Darius and the three young men, our author contains essentially the same materials as the canonical Ezra and some sections of 2 Chronicles and Nehemiah. To the various explanations of this phenomenon we shall recur later. The book may be divided as follows (the verse division is that of the Cambridge LXX):—

Chap. i. = 2 Chron. xxxv. 1-xxxvi. 21.—Great passover of Josiah: his taking of Megiddo. His successes down to the destruction of Jerusalem and the Captivity. (Verses i. 21-22 are not found elsewhere, though the LXX of 2 Chron. xxxv. 20 exhibits a very distant parallel.)

Chap. ii. = Ezra i.—The edict of Cyrus. Restoration of the sacred vessels through Sanballat to Jerusalem.

Chap. iii. 15-25 = Ezra iv. 6-24.—First attempt to rebuild the Temple: opposition of the Samaritans: Decree of Artaxerxes: work abandoned the second year of Darius.

Chap. iii. 1-v. 6.—This section is peculiar to our author. The contest between the three pages waiting at the court of Darius and the victory of the Jewish youth "Zerubbabel," to whom as a reward Darius decrees the return of the Jews and the restoration of the Temple and worship. Partial list of those who returned with "Joachim, son of Zerubbabel."

Chap. iv. 5—List of exiles who returned with Zerubbabel. Work on the Temple begun. Offer of the Samaritans' co-operation rejected. Suspension of the work through their intervention till the reign of Darius.

Chap. v. 1-vi. 18.—Work resumed in the second year of Darius. Correspondence between Sisinnius and Darius with reference to the building of the Temple. Darius' favourable decree. Completion of the work by Zerubbabel.

Chap. vii. 10-15 = Ezra vi. 19-22.—Celebration of the completion of the Temple.

Chap. viii. 1-ix. 36 = Ezra vii.—Return of the exiles under Ezra. Mixture of the old and new version forbidden.

Thus, apart from iii. 1-v. 3, which gives an account of the pages' contest, the contents of the book are doublets of the canonical Ezra and portions of 2 Chronicles and Nehemiah. The beginning of the book seems imperfect, with its abrupt opening "And Josiah held the passover": its conclusion is mutilated, as it breaks off in the middle of a sentence. As Thackery suggests, it probably continued the history of the feast of Tabernacles described in Neh. viii.—a view that is supported by Joseph. Ant. xi. 5. 5, "who describes that feast using an Esdras word τραπανθος and having hitherto followed Esdras as his authority passes on to the Book of Nehemiah."

Claims to Canonicity.—It would seem that even greater value was attached to 1 Esdras than to the Hebrew Ezra. (1) For in the best MSS. (BA) it stands before 2 Esdras—the verbal translation of the Hebrew Ezra and Nehemiah. (2) It is used by Josephus, who in fact does not seem aware of the existence of 2 Esdras. (3) 1 Esdras is frequently quoted by the Greek fathers—Clem. Alex., Origen, Eusebius, and by the Latin—Theodoret, Cyprian, Augustine. The adverse judgment of the church is due to Jerome, who, from his firm attachment to the Hebrew Old Testament, declined to translate the "dreams" of 3 and 4 Esdras. This judgment influenced alike the Council of Trent and the Lutheran church in Germany; for Luther also refused to translate Esdras and the Apocalypse of Ezra.

Origin and Relation to the Canonical Ezra.—Various theories have been given as to the relation of the book and the canonical Ezra.

1. Some scholars, as Keil, Bissell and formerly Schürer, regarded 1 Esdras as a free compilation from the Greek of 2 Esdras (2 Chron. and Ezra-Nehemiah). This theory has now given place to others more accordant with the facts of the case.

2. Others, as Ewald, Hist. of Isr. v. 126-128, and Thackery in Hastings' Bible Dictionary, assume a lost Greek version of Chronicles, Ezra and Nehemiah, from which were derived 1 Esdras—a free redaction of the former and 2 Esdras. Thackery claims that we have "a satisfactory explanation of the coincidences in translation and deviation from the Hebrew in 1 Esdras and 2 Esdras, if we suppose both are to some extent dependent on a lost Greek original." But later in the same article Thackery is compelled to modify this view and admit that 1 Esdras is not a mere redaction of a no longer extant version of the canonical books, but shows not only an independent knowledge of the Hebrew text but also of a Hebrew text superior to that which has been used in our Massoretic text, where 2 Esdras gives either an inaccurate version or a version reproducing the secondary Massoretic text.

3. Others like Michaelis, Trendelenburg, Pohllmann, Herzfeld, Fritzsche hold it to be a direct and independent translation of the Hebrew. There is much to be said in favour of this view. It presupposes in reality two independent recensions of the Hebrew text, such as we cannot reasonably doubt existed at one time of the Book of Daniel. Against this it has been urged that the story of the three pages was written originally in Greek (Ewald, Schürer, Thackery). The only grounds for this theory are the decidedness of the Greek style and the paronomasia in iv. 62 δευκαν καὶ θεουλ σαφατ. But the former is no real objection, and the latter may be purely accidental. On the other hand there are several undoubted Semiticisms. Thus we have two instances of the split relative οὐ... αὐτρι αὐτῷ iv. 63 and the phrase pointed out by Fritzsche ῥα δευκαν τε μπεν ἄφρον. It must, however, be admitted that there are fewer Hebrewisms in this section of the book than in the rest.

4. Sir H. H. Howorth in the treatises referred to at the close of this article has shown cogent grounds for regarding 1 Esdras as the original and genuine Esdras, with 2 Esdras as an abridgment, probably of that of Thodotion. For this view he adduces among others the following grounds: (i.) Its use by Josephus, who apparently was not acquainted with 2 Esdras. (ii.) Its precedence of 2 Esdras in the great uncials. (iii.) Its origin at a time when Chronicles, Ezra and Nehemiah formed a single work. (iv.) Its preservation of a better Hebrew text in many instances than 2 Esdras. (v.) The fact that 1 Esdras and the Septuagint of Daniel go back to one and the same translator, as Dr Gwynn (Dict. Christ. Bio. iv. 977) has pointed out (cf. 1 Esdr. vi. 31, and Dan. vii. 5).

This contention of Howorth has been accepted by Nestle, Cheyne, Bertholet, Ginsburg and other scholars, though they regard the question of an Aramaic original of chapters iii. 1-v. 6 as doubtful. Howorth's further claim that he has established the historical credibility of the book as a whole and its chronological accuracy as against the canonical Ezra has not as yet met with acceptance; but his arguments have not been fairly met and answered.

5. Volz (Enecyc. Bibl. ii. 1490) thinks that the solution of the problem is to be found in a different direction. The text is of unequal value, and the inequalities are so great as to exclude the supposition that the Greek version was produced aus einem Guss. iii. 1-v. 3 is an independent narrative written originally in Greek and itself a composite narrative, the praise of truth being an addition. vi. 1-vii. 15, ii. 15-25 is a fragment of an Aramaic narrative. Some in Josephus (Ant. xi. 4. 9) an account of Samaritan intrigues is introduced immediately after 1 Esdras vii. 15. It is natural to infer that something of the same kind...
has fallen out between vi. and ii. 15-25. The Aramaic text behind 1 Esdras here is better than that behind the canonical Ezra. Next, vii.-ix. is from the Ezræ document (= Ezræ vii.-x.; Neh. vii. 73, viii. 1 sqq.)., though implying a different Hebrew text. i. 15-17; vii. 7-23; vii. 24-6 15 After the Chronicles: likewise i. 16-17. v. 2 Chron. xxiv.-xxvi., 2 Esdras being at the same time the text.

Date.—The book must be placed between 300 B.C. and A.D. 100, when it was used by Josephus. It is idle to attempt any nearer limits until definite conclusions have been arrived at on the chief problems of the book.

 MSS. and Versions.—The book is found in B and A. The latter seems to have preserved the more ancient form of the text, as it is generally that followed by Josephus. The Old Latin in two recensions is published by Sabatier, Biblioth. saeculorum Latino versions antiquae, iii. Another Latin translation is given in Lagarde (Sept. Studien, ii. 1862). In Syriac the text is found only in the Syro-Hexaplar of Paul of Tella (A.D. 616). See Walton's Polyglott. There is also an Ethiopic version edited by Dillmann (Bibl. Vetus. Aeth. v., 1849) and an Armenian.

Ezra, Fourth Book (or Apocalypse) of. This is the most profound and touching of the Jewish Apocalypses. It stands the relation of the Apocalypse of Baruch, but though the relation is so close, they have many points of divergence. Thus, whereas the former represents the ordinary Judaism of the 1st century of the Christian era, the teaching of 4 Ezra on the Law, Works, Justification, Original Sin and Free Will approximates to the school of Shammai and serves to explain the Pauline doctrines on those subjects; but to this subject we shall return.

Original Language and Versions.—In the Latin version our book consists of sixteen chapters, of which, however, only iii.-xiv. are found in the other versions. To iii.-xii., accordingly, the present notice is confined. The Apocryphal version of the Latin MSS. we designate the book 4 Ezra (see Benlys-James, Fourth Book of Ezra, pp. xxiv.-xxvii.). In the First Arabic and Ethiopic versions it is called 4 Ezra; in some Latin MSS. and in the English Authorized Version it is 2 Ezra, and in the Armenian 3 Ezra. Chapters i.-ii. are sometimes called 3 Ezra, and xv.-xvi. 5 Ezra. All the versions go back to a Greek text. This is shown by the late Greek apocryphal of Ezra (Tischendorf, Apocalypses Apocryphae, 1866, pp. 24-33), the author of which was acquainted with the Greek of 4 Ezra; also by quotations from it in Barn. iv. 42; 11=4 Ezra xii. 10 sqq.; v. 5; Clem. Alex. Strom. iii. 16 (before expressly cited) = 4 Ezra v. 35, &c. (see Benlys-James, op. cit. pp. xxvi.-xxviii.). The derivation of the Latin version from the Greek is obvious when we consider its very numerous Graecisms. Thus the genitive is found after the comparative (v. 13) horum majora; xi. 29 duorum capitum majus, even the genitive absolute as in x. 0, the double negative, de et ex with the genitive. Peculiar genders can only be accounted for by the influence of the original forms in Greek, as x. 25 signaculum (φηραύξ) . . . traditae est: xi. 4 caput (σφαλλη) . . . sed et ipsa. In vi. 25 we have the Greek attraction of the relative—omnia isis quibus praebet isti. In his Messias Judaeorum (1868), pp. 36-119, Hilgenfeld has given a reconstruction of the Greek text. Till 1860 only Ewald believed that 4 Ezra was written originally in Hebrew. In that year Wellhausen (Gött. phil. Anz. pp. 12-13) and Charles (Apol. Bar. lxxiii.) pointed out that a Hebrew original must be assumed on various grounds; and this view the former established in his Skizzen u. Vorarbeiten, vi. 234-240 (1890). Of the numerous grounds for this assumption it will be necessary only to adduce such constructions as de quo est, or quia per quem, or qui per se semper ipsum liberabit (= wēpēw) = "through whom it will be done" or to point to such a mistranslation as v. 33, "longanimitas congregabit," where for "congregabitur" (= wēpēw) we require "i evanescevit," which is another and the actual meaning of the Hebrew verb in this passage. The same mistranslation is found in the Vulgate in Hosea iv. 3. Gunkel has adopted this view in his German translation of the book in Kautzsch’s Apok. und Pseud. der A. Testaments, ii. 332-333, and brought forward in confirmation the following remarkable instance in vii. 23, where though the Latin, Syriac, Ethiopic, Arabic and Armenian Versions read festificatur, the Second Arabic version and the Apostolische Constellations have μην έλε γω [αλω, which are to be explained as translations of (τά) καινάνναον. Another interesting case is found in xiv. 3, where the Latin and all other versions but Arabic read super rubrum and the Arabic in monte Sinai. Here there is a corruption of το ττήμου "burn" into το ττήμου." Latin Version.—All the older editions of this version, as those of Fabricius, Sabatier, Vollmar, Hilgenfeld, Fritzsche, as well as in the older editions of the Bible, are based ultimately on only one MS., the Codex Sangernanensis (written A.D. 822), as Gildersleeve proved conclusively in his study of v. 4. This version is followed by all the translations up to verses 36 and 37 in chapter vii., which is omitted in all the above editions, originated through the excision of a leaf in this MS. A splendid edition of this version based on MSS. containing the missing fragment which has never been published has been discovered by Bensly-James, op. cit. This edition has taken account of all the important MSS. known, save one at Leon in Spain. Ethiopic Version.—This version, found in the Ambrosian Library in Milan, was translated into Latin by Ceriani, Monumenta sacra et profana, II. ii. pp. 99-124 (1866). Two years later this scholar edited the Syriac text, op. cit. v. i. pp. 411-1, and in 1885 reproduced the MS. by photo-lithography (Translatio Syra Peshito V.T. v. ii. iv. pp. 553-572). Hilgenfeld incorporated Ceriani’s Latin translation in his Messias Judaorum. This translation needs revision and improvement.

Ethiopic Version.—First edited and translated by Laurence, Primi Ezae libri verso Ethiopiche (1820). Laurence’s Latin translation was corrected by Praetorius and reprinted in Hilgenfeld’s Messias Judaorum. In 1894 Dillmann’s text based on ten MSS. was published—V. T. Aeth. libri apocryphi, v. 153-193.

Georgian Version.—According to F. C. Conybere an accurate Georgian version made from the Greek exists in an 11th-century MS. at Jerusalem.

Relation of the Above Versions.—These versions stand in the order of worth as follows: Latin, Syriac, Ethiopic. The remaining versions are paraphrastic and less accurate, and are guilty of additions and omissions. All the versions, save the Second Arabic one, go back to the same Greek version. The Second Arabic version presupposes a second Greek version.

Editions, etc.—The different versions are now antiquated, except those in the Variorum Apocrypha and the Revised Version of the Apocrypha, and even these are far from satisfactory. Similarly, all the German versions are behindhand, except the excellent edition in Apok. u. Pseud. 252-401, which, however, needs occasional correction.

Contents.—The book (iii.-xiv.) consists of seven visions or parts, like the apocalypse of Baruch. They are: (1) i. 1-19; (2) v. 20-21; 34; (3) vi. 35-ix. 25; (4) ix. 26-x. 65; (5) xi-xii. 51; (6) xiii-xiv. (7) xv. 1-36. These visions are inserted between speculations and (2) eschatological questions. The first three are devoted to the discussion of religious problems affecting in the main the individual. The presuppositions underlying these are in many cases the same as those in the Pauline Epistles. The next three visions are principally concerned with eschatological problems which relate to the nation. The seventh vision
Thus the chief champion of the unity of the book makes so many concessions as to its dependence on previously existing sources that, to the student of eschatology, there is little to choose between his view and that of Kabisch. In fact, if the true meaning of the borrowed materials is to be discovered, the text must be disentangled. Hence the need of some such analysis as that of Kabisch (Das vierte Buch Ezra, 1880): S = an Apocalypse of Salathiel, c. A.D. 100, preserved in a fragmentary condition, i.-i. 31, iv. 1-51, v. 136-190, vii. 25, vii. 45-88, viii. 62, ix. 13-57, xiii. 40-48, xiv. 28-35. E = an Ezra Apocalypse, c. 31 B.C., iv. 52-134, v. 13-28, vii. 26-44, viii. 63-ix. 12. A = an Eagle Vision, c. A.D. 90, x. 60-xii. 35. M = a Son-of-Man Vision, xiii. E = an Ezra fragment, c. A.D. 100, xiv. 1-17a, 18-21, 36-47. All these, according to Kabisch, were edited by a Zealot, c. 120, who supplied the connecting links and made many small additions. In the main this analysis is excellent. If we assume that the editor was also the author of S, and that such a vigorous stylist, as he shows himself to be, recasts to some extent the materials he borrowed, there remains but slight difference between the views of Kabisch and Gunkel. Neither view, however, is quite satisfactory, and the problem still awaits solution. Other attempts, such as Ewald's (Gesch. d. Volkes Israel, vi. 69-83) and De Faye's (Apocalypses juives, 155-165), make no contribution.

School of the Author.—The author or final redactor of the book was a pessimist, and herein his book stands in strong contrast with the Apocalypses of Baruch. Thus to the question proposed by Kabisch, "Are there few that be saved?" he has no hesitation in answering, "There be many created, but few that he saved" (viii. 3). "An evil heart hath grown up in us which hath led us astray... and that not a few only but wellnigh all that have been created" (vii. 48). In the Apocalypse of Baruch on the other hand it is definitely maintained that not a few shall be saved (xii. 11). Moreover, the sufferings of the wicked are so great in the next world it be better, according to 4 Ezra (as also to the school of Shammai), that man had not been born. It is much better (for the sake of the field) than for us; for the expect not a judgment and know not of torments" (vii. 66): yet "it would have been best not to have given a body to Adam, or that being done, to have restrained him from sin; for what profit is there that man should in the present life live in heaviness and after death look for punishment" (vii. 116, 117). In xiv. 12 the nexus of life, sin and suffering just referred to, is put still more strongly: "It were better we had not been at all that we should be born and sin and suffer." The different attitude of these two writers towards this question springs from their respective views on the question of the Fall of Man. The author of Baruch declares (iv. 15, 19): "For though Adam sinned and brought upon himself and all, yet of those who were born from him each one of them prepared for his own soul torment to come, and again each one of them has chosen himself glories to come... each one of us has been the Adam of his own soul." Though the writer of 4 Ezra would admit the possibility of a few Israelites attaining to salvation through the most strenuous endeavour, yet he holds that man is all but doomed through his original evil disposition or through the fall of Adam (vii. 118). "O Adam, what hast thou done: for though it was thou that sinned, the evil is not fallen on thee alone, but upon all of us that come of thee." Another contrast between the two books is that while Baruch shows some mercy to the Gentiles (lxii. 4-6) in the Messianic period, none according to 4 Ezra and the Shammaites (Joseph. Sanh. xiii. 2) will be extended to them. iii. 30, ix. 22 sq., xii. 34, xiii. 37 sq.).

On the above grounds it is not unreasonable to conclude that whereas the Apocalypse of Baruch owes its leading characteristics to a pupil of Hillel's school, 4 Ezra shows just as clearly its derivation from that of Shamai. Kohler (Jewish Encyc.) pointed out that "he who was in the New, both of the Book, and of the dying born has died." But here death is said to be preferable to witnessing the present woes of Jerusalem.
v. 221) points out that the view of 4 Ezra that the Ten Tribes will return was held by the Shammaites, whereas it was denied by Agiba. The Apocalypse of Baruch is silent on this point.

Time and Place.—The work was written towards the close of the 1st century (iii, 1, 39), and somewhere in the east.

Literature.—In addition to the authorities mentioned above, see Dillmann, Herzog’s Real-Enzyklopädie, xii. 353 sqq.; Schürer, Gesch. des Judentums, iii. 246 sqq.; and the articles on 4 Esdras in Hastings’s Bible Dictionary and the Encyclopædia Biblica by Thackernay and James respectively.

Ezra and Nehemiah, Books of, in the Old Testament.

The two canonical books entitled Ezra and Nehemiah in the English Bible correspond to the 1 and 2 Esdras of the Vulgate, to the 2 Esdras of the Septuagint, and to the Esdras and Nehemiah of the Masoretic (Hebrew) text. Though for many centuries they have been thus treated as separate compositions, we have abundant evidence that they were actually regarded as forming but one book, and a careful examination proves that together with the book of Chronicles they constitute one single work. The two books may therefore be conveniently treated together.

1. Position and Date.—Origen (Euseb., H. E. vi. 253) expressly enumerating the twenty-two books of the old covenant as acknowledged by the Jews and accepted by the Christian church, names “the First and Second Ezra in one book.” Melito of Sardis (Euseb. H. E. vii. 27) in his letter mentions the book of Ezra only. So also the Talmud (in Bâd bâthrá, 14, 2), nor can it be dismissed that Josephus in his enumeration (c. Ap. i. 8) reckoned Nehemiah as apart from Ezra. That the Jews themselves recognized no real separation is shown by the fact that no Masoretic notes are found after Ezra x., but at the end of Nehemiah the contents of both are reckoned together, and it is stated that Neh. iii. 22 is the middle verse of the book. Their position in the Hebrew Bible before the book of Chronicles is, however, illogical. The introductory verses of Ezra i. are identical with the conclusion of 2 Chron. xxxvi., whilst in the version of 1 Esdras no less than two chapters (2 Chron. xxxvi. 1 sqq.) overlap. The cause of the separation is probably to be found in the late reception of Chronicles into the Jewish canon. Further proof of the unity of the three is to be found in the general similarity of style and treatment. The same linguistic criteria recur, and the interest in lists and genealogies, in priests and Levites, and in the temple service point unmistakably to the presence of the same hand (the so-called “chronicler”) in Chronicles—Ezra-Nehemiah. See Bible (sect. Canon); Chronicles.

The period of history covered by the books of Ezra and Nehemiah extends from the return of the exiles under Zerubbabel in 537-536 B.C. to Nehemiah’s departure with Tamar and his wife to Jerusalem in 432 B.C. In their present form, however, the books are considerably later, and allusions to Nehemiah in the past (Neh. xii. 26, 47), to the days of Jaddua (the grandson of Nehemiah’s contemporary Joiada; ib. xi. 11), to Darius (Nothus 423 B.C. or rather Codomannus 336 B.C., ib. v. 22), and the use of the term “king of Persia,” as a distinctive title after the fall of that empire (332 B.C.), are enough to show that, as a whole, they belong to the same age as the book of Chronicles.

2. Contents.—Their contents may be divided into four parts:—

(a) The events preceding the mission of Ezra (i. vi.).—In the first year of his reign Cyrus was inspired to grant a decree permitting the Jews to return to build the temple in Jerusalem (i.); a list of families is given (i. i.). The altar of burnt-offering was set up, and in the second year of the return the foundations of the new temple were laid with great solemnity (iii.). The “adversaries of Judah and Benjamin” offered to assist but were repulsed, and they raised such opposition to the progress of the work that it ceased until the second year of Darius (521-520 B.C.). Aroused by the prophets Haggai and Zechariah the building was then resumed, and despite fresh attempts to hinder the work it was completed, consecrated and dedicated in the sixth year of that king (vi.). The event was solemnized by the celebration of the Passover (cf. 2 Chron. xxx. Hezekiah; xxxv. Josiah).

(b) An interval of fifty-eight years is passed over in silence, and the rest of the book of Ezra comprises his account of his mission to Jerusalem (vii. x.). Ezra, a scribe of repute, well versed in the laws of Moses, returns with a band of exiles in order to organize the religious community. A few months after his arrival (seventh year of Artaxerxes, 458 B.C.) he instituted a great religious reform, viz. the prohibition of intermarriage with the heathen of the land (cf. already vi. 21). In spite of some opposition (x. 15 obscurely worded) the reform was accepted, and the foundations of a new community were laid.

(c) Twelve years elapse before the return of Nehemiah, whose description of his work is one of the most interesting pieces of Old Testament narrative (Neh. i.-vi.). In the twentieth year of Artaxerxes (445 B.C.), Nehemiah the royal cup-bearer at Shushan (Susa) was visited by friends from Judah and was overcome with grief at the tidings of the miserable condition of Jerusalem and the pitiful state of the Judean remnant which had escaped the captivity. He obtained permission to return, and on reaching the city made a secret survey of the ruins and called upon the nobles and rulers to assist in repairing them. Much opposition was caused by Sanballat the Horonite (i.e. of the Moabite Horonaim or Beth-horon, about 15 m. N.W. of Jerusalem), Tobiah the Ammonite, Geshem (or Gashmu) the Arabian, and the Ashdodites, whose virulence increased as the rebuilding of the walls advanced. But neither heeding the threat of the city and upon the life of Nehemiah, and in spite of intrigues among certain members of the Judean section, in fifty-two years the walls were complete (Neh. vi. 15). The hostility, however, did not cease, and measures were taken to ensure the safety of the city (vi. 16–vii. 4). A valuable account is given of Nehemiah’s economical reforms, illustrating the internal social conditions of the period and the general character of the former governors who had been placed in charge (v., cf. the laws codified in Lev. xxv. 33 sqq.).

(d) The remaining chapters carry on the story of the labours of both Ezra and Nehemiah. The list of those who returned under the decree of Cyrus is repeated (Neh. vii.), and leads up to the reading of the Law by Ezra, a great national confession of guilt, and a solemn undertaking to observe the new covenant, the provisions of which are detailed (x. 28–39). After sundry lists of the families dwelling in Jerusalem and its neighbourhood (xi. 1 sqq., apparently a sequel to vii. 1–4), and of various priests and Levites, an account is given of the dedication of the walls (xii. 27–43), the arrangements for the Levitical organization (xiv. 44–47), and a fresh separation from the heathen (Moabites and Ammonites, xiii. 1–5; cf. Deut. xxiii. 3 sqq.). The book concludes with another extract from Nehemiah’s memoirs dealing with the events of a second visit, twelve years later (xiii. 31–32). On this occasion he vindicated the sanctity of the temple by expelling Tobiah, reorganized the supplies for the Levites, took measures to uphold the observance of the Sabbath, and protested energetically against the foreign marriages. In the course of his reforms he thrust out a son of Joiada (son of Eliashib, the high-priest), who had married the daughter of Sanballat, an incident which had an important result (see Samaritans).

That these books are the result of compilation (like the book of Chronicles itself) is evident from the many abrupt changes, the inclusion of certain documents written in an Aramaic dialect (Ezra. iv. 7–viii. 17, i. 26–28); the character of the name-lists; the lengthy gaps in the history; the use made of two distinct sources, attributed to Ezra and Nehemiah respectively, and from the varying form in which the narratives are cast. The
chronicler’s hand can usually be readily recognized. There are relatively few traces of it in Nehemiah’s memoirs and in the Aramaic documents, but elsewhere the sources are largely coloured, if not written from the standpoints of this group. Examples of artificial arrangement appear notably in Ezr. ii.—ix. compared with Neh. vii.—viii. ii. (first clause); in the present position of Ezr. iv. 6—23; and in the dislocation of certain portions of the two memoirs in Neh. vii.—xii. (see below). It should be noticed that the present order of the narratives involves the theory that some catastrophe ensued after Ezr. x. and before Neh. i.; that the walls had been destroyed and the gates burnt down; that some external opposition (with which, however, Ezra did not have to contend) had been successful; that the main object of Ezra’s mission was delayed for twelve years, and, finally, that Nehemiah’s energies were with the work of social and religious reorganization successful. These topics raise serious historical problems (see J.E.W., ‘History,’ § 21).

3. Criticism of Ezra i.—vi.—The chronicler’s account of the destruction of Jerusalem, the seventy years’ interval (2 Chron. xxxvi. 20 sqq.; cf. Jer. xxi. 11, xxix. 10, also Is. xxi. 17), and the return of 42,360 of the exiles (Ezr. ii. 64 sqq.) represent a special view of the history of the period. The totals, as also the detailed figures, in Ezr., Neh. and 1 Esdr. v. vary considerably; the number is extremely large (contrast Jer. lii. 30); it includes the common people (contrast 2 Kings xxiv. 14, xxv. 12), and Jeremiah (contrast Jer. xxv. 9) as well; not these Jews were taken off to other places besides Babylon and that many remained behind in Babylon. According to this view, Judah and Jerusalem were practically deserted until the return. The list in Ezr. ii. is that of families which returned ‘‘every man unto his city’’ under twelve leaders (including Nehemiah, Azariah [cf. Ezra], Zerubbabel and Jeshua); it recurs with many variations in a different and apparently more original context in Neh. vii., and in 1 Esdr. v. is ascribed to the time of Darius. The families (to judge from the northwards extension of Judean territory) are probably those of the population in the later Persian period. It is not unlikely those who returned that the home of their ancestors (see C. F. Kent, ‘Isr. Hist. and Bibl. Narratives,’ p. 379). The offerings which are for the temple-service in Neh. vii. 70—72 (cf. 1 Chron. xxix. 6—8) are for the building of the temple in Ezr. ii. 68—70; and since the walls are not yet built, the topographical details in Neh. vii. (see 1 Esdr. v. 47) are adjusted, and the event of the seventh month is not the reading of the Law amidst the laments of the people (Neh. vii.; see vi. 9—11) but the erection of the altar by Jeshua and Zerubbabel under insuspicious circumstances (cf. Ezr. iii. 3 with 1 Esdr. v. 50). The chronologically misplaced account of the successful opposition in the time of Ahhasuerus (i.e. Xerxes) and Artaxerxes (the son and grandson of Darius respectively) breaks the account of the temple under Cyrus and Darius, and is concerned with the city walls (iv. 6—23);1 there is some obscurity in vii. 7—9: Ruhum and Shimshai evidently take the lead, Tabeel may be an Aramaized equivalent of Tobiah. A recent return is implied (iv. 12) and the record hints that a new decree may be made (v. 21). The account of the unsuccessful opposition to the temple in the time of Darius (v. sqq.; for another account see Jos. Ant. xi. 4, 9) is independent of iv. 7—23, and throws another light upon the history of Cyrus (cf. iii. 5; contrast i. 2—4). It implies that Sheshbazzar, who had been sent with the temple vessels in the time of Cyrus, had laid the foundations and that the work had continued without cessation (v. 16; contrast iv. v. 24). The beginning of the reply of Darius is wanting (vi. 6 sqq.), and the decree which had been sought in Babylon is found at Ecbatana. Chap. vi. 15 sqq. follow more naturally upon v. 1—2, but v. 14 with its difficult reference to Artaxerxes now seems to presuppose the decree in iv. 21 and looks forward to the time of Ezra or Nehemiah.

As regards this section (Ezr. i.—vi.) as a whole, there is little doubt that i. iii.—iv. 5; vi. 15—22 are from the chronicler, whose free treatment of his material is seen in the use he has made of ch. ii. Notwithstanding the unimpeachable evidence for the tolerant attitude of Persian kings and governors towards the religion of subject races, it is probable that the various decrees incorporated in the book (cf. also 1 Esdr. iv. 42 sqq.) have been reshaped from a Jewish standpoint. A noteworthy example appears in the account of the unique powers entrusted to Ezra (vii. 11—26), the introduction to whose memoirs, at all events, is quite in the style of the chronicler.

The Memoirs of Nehemiah and Ezra.—The memoirs of Ezra and Nehemiah do not appear to have been incorporated without some adjustment. The lapse of time between Neh. i. 1 and ii. 1 is noteworthy, and with the prayer in i. 5—11 cf. Ezr. ix. 6—15, Dan. ix. 4 sqq. (also parallels in Deuteronomy); chap. i. in its present form may be a compiler’s introduction. The important topographical list in ch. iii. is probably from another source; the style is different, Nehemiah is absent, and the high-priest is unusually prominent.2 Chap. v., where Nehemiah reviews his past conduct as governor, turns aside to economic reforms and scarcely falls within the fifty-two days of the building of the walls. The chapter is closely associated with the contents of xiii., and breaks the account of the opposition. Anticipated already in ii. 10, the hostility partly arises from the repudiation of Samaritan religious claims (ii. 26; cf. Ezr. iv. 3) and is partly political. It is difficult to follow its progresse clearly, and the account ceases abruptly in vi. 17—19 with the notice of the conspiracy of Tobiah and the nobles of Judah. The chronicler’s style can be recognized in vi. 1—5 (in its present form), where steps are taken to protect and to people Jerusalem; the older sequel is now found in ch. xi. Whilst the account of the dedication of the walls is marked by the use of the pronoun ‘I’ (ch. ii.), it is probable that whole of this chapter, and when the more trustworthy memoirs of Nehemiah are resumed (xiii. 4 sqq.) the episodes, although placed twelve years later (ver. 6), are intimately connected with the preceding reforms (cf. xii. 44—xiii. 3 with xiii. 10 sqq., 23 sqq.).3 Nehemiah’s attitude towards intermarriage is markedly moderate in contrast to the drastic measures of Ezra, whose mission and work the simpler and perhaps earlier narratives of Nehemiah originally ignored, and the relation between the two is complicated further by the literary character of the memoir of Ezra.

To the last mentioned prefixed (a) the scribe’s genealogy, which traces him back to Aaron and names as his immediate ancestor, Seraiah, who had been slain 130 years previously (Ezr. vii. 2), and (b) an independent account of the return (vi. 6—10) with a reference to Ezra’s renown, obviously not from the hand of Ezra himself. Whatever the original prelude to Ezra’s thanksgiving may have been (vi. 27 sqq.), we now have the essentially Jewish account of the letter of Artaxerxes with its unusual concessions.4 The list of those who returned amounts to the moderate total of 1496 males (viii., but 1690 in 1 Esdr. viii. 30 sqq.). Ezra’s mission was obviously continued (vii. 6 sqq., 10—14 sqq., 25—viii. 17, 24—30, 33 sqq.), but four months elapsed between his return in the fifth month (vii. 9) and the preparations for the marriage reforms in the ninth (x. 9), and there is a delay of twelve years before the Law is read (Neh. viii.). The Septuagint version (1 Esdr. ix.; cf. Josephus, Antiq. xi. 5 and some modern scholars) would place II. 8 (see further, G. H. Mitchell, ‘Journ. of Bibl. Lit.’ (1903), pp. 88 sqq.)

The chronological difficulties will be seen from xiii. 6 (‘‘before this’’) and xiii. 8 (‘‘in the days of’’), in which it is asked what would be the occasion of Nehemiah’s later visit (see G. A. Smith, ‘Expositor,’ July 1906, p. 12). His previous departure is perhaps foreshadowed in vii. 2 (see Ency. Bib. col. 1480). Papyri from a Jewish colony in Elephantine (407 b.c.) clearly show the form which royal permits could take, and what the Jews were prepared to give in return: the points of resemblance are extremely interesting, but compared with the biblical documents the papyri reveal some striking differences.
The latter after Ezr. x., but more probably this event (dated in the seventh month) should precede the great undertaking in Ezr. ix.1 That the adjustment was attended with considerable revision of the passages appears from a careful comparison of Neh. viii. sq. with Ezr. ix. sq. With Ezra's confession (ix. 6 sq.) compare the prayer in Neh. ix. 5 sq., which the Septuagint ascribes to him. In Ezr. x. (written in the third person) the number of those that had intermarried with the heathen is relatively small considering the general trend of the preliminaries, and the list bears a marked resemblance to that in ch. ii. It ends abruptly and obscurely (x. 44; cf. 1 Esdr. ix. 33), and whilst as a whole the memoirs of Ezra point to ideas later than those of Nehemiah, the present close literary connexion between them is seen in the isolated reference to Johanan the son of Elassib in Ezr. x. 6, which seems to be connected with Neh. xiii. 7, and (after W. R. Smith) in the suitability of ii. xiii. 2, between Ezr. x. 9 and 10. The list of signatories in Neh. x. 3-27 should be compared with the names in xii. 1 and Chron. xxxiv.; the true connexion of ix. 38 is very obscure, and the relation to Ezr. ix. seq. is complicated by the reference to the separation from the heathen in Neh. ix. 2. The description of the covenant (Neh. x. 28 sqq., marked by the use of "we") is closely connected with xii. 33-34, and so forth (from the same or an allied source), and anticipates the parallel though somewhat preliminary measures detailed in the more genuine memoirs (Neh. xii. 4 sqq.). Finally, the specific allusion in xii. 1-3 to Ammon and Moab is possibly intended as an introduction to the references to Tobiah and Sanballat respectively.

5. Summary.—The literary and historical criticism of Ezra-Nehemiah is closely bound up with that of Chronicles, whose characteristic features it shares. Although the three formed a unit at one stage it may seem doubtful whether two or three closely related chapters as 1 Chron. ix. and Neh. xii. would have appeared in one single work, while the repetition of Neh. vii.-viii. 1 in Ezr. ii.-iii. 1 is less unnatural if they had originally appeared in distinct sources. Thus other hands apart from the compiler of Chronicles may have helped to shape the narratives, either before their union with that compilation or after their separation. The present introduction is also due partly to specific historical theories regarding the post-exilic period. Here the recension in 1 Esdras especially merits attention for its text, literary structure and for its variant traditions.3 Its account of a return in the time of Darius scarcely arose after Ezr. i.-ii. (Cyprus); the reverse seems more probable, and the possibility of some confusion or of an intentional adjustment to the earlier date is emphasized by the relation between the popular feeling in Ezr. iii. 12 (Cyprus) and Hag. ii. 3 (Darius), and between the grant by Cyrus in iii. 7 (it is not certain that he held Phoenicia) and the permit of Josiah in xxvii. 17 (see xxvii. 20). The list of the names belongs to the list of names which reappears in Ezr. ii. (Cyprus). But from the independent testimony of Haggai and Zechariah it is doubtful whether the chronicler's account of the return under Cyrus is at all trustworthy. The list in 1 Esdr. v., Ezr. ii., as already observed, appears to be in its more original context in Neh. vii., i.e. in the time of Artaxerxes, and it is questionable whether the earliest of the surviving detailed traditions in Ezra-Nehemiah went back before this reign. It is precisely at this age that there is evidence for a return, apparently other than that of Ezra or Nehemiah (see Ezr. iv. 12), yet another seems to be preserved unless the records were used for the history of earlier periods (cf. generally Ezr. iii. 12 sqq. with Neh. vii. 9-11; Ezr. iii. 7 with the special favour enlisted on behalf of the Jews in vii. 7 sqq., vii. 21; Neh. ii. 7 sqq.). But the account of the events in the reign of Artaxerxes is extremely perplexing. Since the building of the walls of Jerusalem must have begun early in the fifth month (Neh. vi. 15), an allowance of three days (ii. 41) makes the date of Nehemiah's arrival practically the anniversary of Ezra's return (Ezr. vii. 9, viii. 32). Considering the close connexion between the work of the two men this can hardly be accidental. The compiler, however, clearly intends Neh. vi. 15 (25th of sixth month) to be the prelude to the events in Neh. vii. 73, viii. (seventh month), but the true sequence of Neh. vi. sqq. is uncertain, and the possibility of artificiality is suggested by the unembellished statement of Josephus that the building of the walls occupied, not fifty-two days, but two years four months (Ant. xi. 5. 8). The present chronological order of Nehemiah's work is confused (cf. § 4 n. 3), and the obscure interval of twelve years in his work corresponds very closely to that which now separates the records of Ezra's labours. However, both the recovery of the compilers' aims and attempted reconstructions are precluded from finality by the scantiness of independent historical evidence. (See further JEWS: History, § 32 seq.)

BIBLIOGRAPHY.—S. R. Driver, Lit. of the O. T. (1900), pp. 540 sqq. and on the contemporary influence of the Gnostic and Christian Bibles, in Germ. Bibel, 1901 (1901), A. Bertholet (1902), and T. W. Davies (Gent. Bibel, 1909). Impetus to recent criticism of these books starts with Van Hoonacker (Neh. et Esd. 1890; see also Expos. Times, 1897, pp. 351-354, and 1897, pp. 531-541), Reiss, Recherches, Recueil des études, 1896, and W. H. Kosters (Germ. ed., Wiederherstellung Israels, 1895). The latter's important conclusions (for which see his article with Cheyne's additions in Encyc. Bibl. col. 147 sqq., 1895; seq.), were criticized mainly by J. Wellhausen, Geschichte der Mitte (Germ. translation of The History of the Univ. of Göttingen, 1895, pp. 166-180), E. Meyer (Entstehung d. Judentums, 1896), J. Nobel (Wiederherstellung d. jüd. Gemein., 1896, and S. Jampel in Monatsschrift f. Gesch. u. Wissens. d. Judentums, vols. xvi.-xlviii. 1902-1903). The negative criticisms of Kosters have, however, been strengthened by his replies (in the Dutch Theolog. Tijdschrift, and by the discussions of C. C. Torrey and J. F. Smith in the Copyright Law of the United States [Washington, 1909], and held by E. D. 1909), and his general position appears to do more justice to the biblical evidence as a whole. (S. A. C.)

EZZO, or EHRENREICHT (954-1024), count palatine in Lorraine, was the son of a certain Hermann (d. c. 1000), also a count palatine in Lorraine who had possessions in the neighbourhood of Bonn. Having married Matilda (d. 1025), a daughter of the emperor Otto II., Ezzo came to the front during the reign of his brother-in-law, the emperor Otto III. (983-1002); his power was increased owing to the liberal grant of lands in Thuringia and Franconia which he received with his wife, and some time later his position as count palatine was recognized as an hereditary dignity. Otto's successor, the emperor Henry II., was less friendly towards the powerful count palatine, though there was no serious trouble between them until 1011; but some disturbances in Lorraine quickly compelled the emperor to come to terms, and the assistance of Ezzo was purchased by a gift of lands. Henceforward the relations between Henry and his vassal appear to have been satisfactory. Very little is known about Ezzo's later life, but we are told that he died at a great age at Saalfeld on the 21st of March 1024. He left three sons, among them being Hermann, who was archbishop of Cologne from 1036 to 1056, and Otto, who was for a short time duke of Swabia; and seven daughters, six of whom became abbesses. Ezzo founded a monastery at Brauweiler near Cologne, the place where his marriage had been celebrated. This was dedicated in 1038 by Pilgrim, archbishop of Cologne, and here both Ezzo and his wife were buried.

EZZOLOED, or ANEGENCE, an old German poem, written by Ezzo, a scholar of Bamberg. It was written about 1060, but not, as one authority asserts, composed while the author was making a pilgrimage to Jerusalem. The subject of the poem is the life of Christ. Very popular during the later middle ages, the Ezzolied had a great influence on the poetry of south Germany, and is valuable as a monument of the poetical literature of the time. The text is printed in the Denkmäler deutscher Poesie und Prosa aus dem 8.-12. Jahrhundert (Berlin, 1892) of C. V. Mülenthal and W. Scherer.
This is the sixth letter of the English alphabet as it was of the Latin. In the ordinary Greek alphabet the symbol has disappeared, although it survived far into historical times in many Greek dialects as Φ, the digamma, the use of which in early times was inductively proved by Bentley, when comparatively little was known of the local alphabets and dialects of Greece. The so-called stigma ϕ, which serves for the numeral 6, is all that remains to represent it. This symbol derives its name from its resemblance in medieval MSS. to the abbreviation for στ. The symbol occupying the same position in the Phoenician alphabet was Vau (𐤧𐤯), which seems to be represented by the Greek Φ, the Latin φ, at the end of the early alphabet. Many authorities therefore contend that F is only a modification of the preceding symbol E and has nothing to do with the symbol Vau. In some early Latin inscriptions F is represented by V, as E is by I. It must be admitted that the resemblance between the sixth symbol of the Phoenician alphabet and the corresponding symbol of the European alphabet is not striking. But the position of the limbs of symbols in early alphabets often varies surprisingly. In Greek, besides F we find for ϕ in Pamphylia (the old Greek district in Asia which possesses symbols α, μ, ι, κ, τ, and in Boeotia, Thessaly, Etruria, and Campania and on Chalcidian vases of Italy the form Κ, although except at Cumae and on the vases the form Φ exists contemporaneously with F or even earlier. At the little town of Falerii (Civita Castellana), whose alphabet is undoubtedly of the same origin as the Latin, the F takes the form Φ. Though uncertain, therefore, it seems not impossible that the original symbol of the Phoenician alphabet, which was a consonant like the English w, may have been differentiated in Greek into two symbols, one indicating the consonant value w and retaining the position of the Phoenician consonant Vau, the other having the vowel value u, which ultimately most dialects changed to a modified sound like French u or German a. Be this as it may, the value of the symbol F in Greek was w, a bilabial voiced sound, not the labio-dental unvoiced sound which we call f. When the Romans adopted the Greek alphabet they took over the symbols with their Greek values. But Greek had no sound corresponding to the Latin f, for ϕ was pronounced p-h, like the final sound of lip in ordinary English or the initial sound of pig in Irish English. Consequently in the very old inscription on a gold fibula found at Praeneste and published in 1887 (see Alphabet) the Latin f is represented by FB. Later, as Latin did not use F for the consonant written as f in wt, &c., Φ was dropped and F received a new special value in Latin as representative of the unvoiced labio-dental spirant. In the Osco and Umbrian dialects, whose alphabet was borrowed from Etruscan, a special form appears for f, viz. 8, the old form being kept for the other consonant v (i.e. English w). The 8 has generally been asserted to be developed out of the second element in the combination FB, its upper and lower halves being first converted into lozenges, 8, which naturally changed to B when inscribed without lifting the writing or incising implement. Recent discoveries, however, make this doubtful (see Alphabet).

FABBRO, ANGELO (1732-1803). Italian biographer, was born at Marradi in Tuscany on the 25th of September 1732. After studying at Fiesole he entered the Roman college founded for the education of young Tuscans. On the conclusion of his studies he continued his stay in Rome, and has been introduced to the celebrated Jansenist Bottari, received from him the canonry of Santa Teresa in Trastevere. Some time after this he was chosen to preach a discourse in the pontifical chapel before Benedict XIV. and made such a favourable impression that the pontiff settled on him an annuity, with the possession of which Fabbro was able to devote his whole time to study. He was intimate with Leopold I., grand-duke of Tuscany, but the Jesuits disliked him on account of his Jansenist views. Besides other literary labours he began at Pisa in 1771 a literary journal, which he continued till 1796. About 1772 he made a journey to Paris, where he formed the acquaintance of Condorcet, Diderot, d’Alembert, Rousseau and most of the other eminent Frenchmen of the day. He also spent four months in London. He died at Pisa on the 22nd of September 1803.

The following are his principal works:—Vitae Italorum doctrinae excellentissimi qui saeculis XVII. et XVIII. floruerunt (20 vols., Pisa, 1778-1799, 1804-1806), the last two vols., published posthumously, contain a list of the authors: Ludovici Medici Magni Vitae (2 vols., Pisa, 1784), a work which served as a basis for H. Roscoe’s Life of Lorenzo dei Medici; Leonis X. pontificis maximi Vita (Pisa, 1797); and Dialogi di Dante Alighieri, di Angelo Poliziano, di Lodovico Ariosto, e di Torquato Tasso (Parma, 1800).

FABER, the name of a family of German lead-pencil manufacturers. Their business was founded in 1760 at Stein, near Nuremberg, by Kaspar Faber (d. 1784). It was then inherited by his son Anton Wilhelm (d. 1819). Georg Leonhard Faber succeeded in 1810 (d. 1839), and the business passed to Johann Lothar von Faber (1817-1896), the great-grandson of the founder. At the time of his assuming control about twenty hands were employed, under old-fashioned conditions, and owing to the invention of the French crayons Contés of Nicolas Jacques Conté (q.v.) competition had reduced the entire German lead pencil industry (see Pencils). Johann introduced improvements in machinery and methods, brought his factory to the highest state of efficiency, and it became a model for all the other German and Austrian manufacturers. He established branches in New York, Paris, London and Berlin, and agencies in Vienna, St Petersburg and Hamburg, and made his greatest coup in 1856, when he contracted for the exclusive control of the graphite obtained from the East Siberian mines. Faber had also branched out into the manufacture of water-colour and oil paints, inks, slates and slate-pencils, and engineers’ and architects’ drawing instruments, and built additional factories to house his various industries at New York and at Noisy-le-Sec, near Paris, and had his own cedar mills in Florida. For his services to German industry he received a patent of nobility and an appointment as councillor of state. After the death of his widow (1893) the business was inherited by his grand-daughter Countess Ottile von Faber-Castell and her husband, Count Alexander.

FABER, BASIL (1520-c. 1576), Lutheran schoolmaster and theologian, was born at Sorau, in lower Lusatia, in 1520. In 1538 he entered the university of Wittenberg, studying as papier gratis under Melanchthon. Choosing the schoolmaster’s profession, he became successively rector of the schools at Nordhausen, Tenstatt (1555), Magdeburg (1557) and Quedlinburg (1560). From this last post he was removed in December 1570 as a Crypto-Calvinist. In 1571 he was appointed to the Raths-gymnasium at Erfurt, not as rector, but as director (Vorstichter). In this situation he remained till his death in 1573 or 1576. His translation of the first twenty-five chapters of Luther’s commentary on Genesis was published in 1557; in other ways he promoted the spread of Lutheran views. He was a contributor to the first four of the Magdeburg Centuries. He is best known by his gymnastics exercitationem school of Bishop Nordhausen, which, under his direction, improved by J. H. Leich, 1749, folio, 2 vols.; this was followed by his Libellus de disciplina scholastica (1752).

See Wagenmann and G. Müller in Herzog-Hauck’s Realencyclopadie (A. Go. *.)

FABER, FREDERICK WILLIAM (1814-1863). British hymn writer and theologian, was born on the 26th of June 1814 at Calverley, Yorkshire, of which place his grandfather, Thomas Faber, was vicar. He attended the grammar school of Bishop Auckland for a short time, but a large portion of his boyhood was spent in Westmorland. He afterwards went to Harrow
and of Balliol College, Oxford. In 1835 he obtained a scholarship at University College; and in 1836 he gained the Newdigate prize for a poem on "The Knights of St John," which elicited special praise from Keble. Among his college friends were Dean Stanley and Roundell Palmer, 1st earl of Selborne. In January 1837 he was elected fellow of University College. Meanwhile he had given up the Calvinistic views of his youth, and had become an enthusiastic follower of John Henry Newman. In 1841 a travelling tutorship took him to the continent; and on his return a book appeared called *Sights and Thoughts in Foreign Churches and among Foreign Peoples* (London, 1842), with a dedication to his friend the poet Wordsworth. He accepted the rectory of Epsom in Hampshire, but resigned after a year. He published a number of theological works, and edited the *Oratorian Lives of the Saints*. He was an eloquent preacher, and a man of great charm of character. It is mainly as a hymn-writer, however, that Faber is remembered. Among his best-known hymns are:—"The Greatness of God," "The Will of God," "The Eternal Father," "The God of my Childhood," "Jesus is God," "The Pilgrims of the Night," "The Land beyond the Sea," "Sweet Saviour, bless us ere we go," "I was wandering and weary," and "The Shadow of the Rock." The hymns are largely used in Protestant collections. In addition to many pamphlets and translations, Faber published the following books: *For Jesus: The Precious Blood; Bekithem; The Blessed Sacrament; The Creator and the Creature; Growth of Holiness; Spiritual Conferences; The Foot of the Cross* (8 vols., London, 1853-1860).

See his *Life and Letters*, by Father J. E. Bowden (London, 1860), and *A Brief Sketch of the Early Life of the late F. W. Faber, D.D.*, by his brother the Rev. F. A. Faber (London, 1869).

**FABER, FABRIS or FABRY (surnamed STAPULENSIS), JACOBUS**

*Jacques Leëfrev d'Étaples* (c.1455-1536), a pioneer of the Protestant movement in France, was born of humble parents at Étaples, in Pas de Calais. He entered Picardy, about 1455. He appears to have been possessed of considerable means, and had at an early age been ordained priest when he entered the university of Paris for higher education. Heresy of Sparta was his master in Greek. He visited Italy before 1486, for he heard the lectures of Argyropulus, who died in that year; he formed a friendship with Paulus Aemilius of Verona. In 1492 he again travelled in Italy, studying in Florence, Rome and Venice, making himself familiar with the writings of Aristotle, though greatly influenced by the Platonic philosophy. Returning to Paris, he became professor in the college of Cardinal Lemoine. Among his famous pupils were F. W. Vatable and Farel; his connection with the latter drew him to the Calvinistic side of the movement of reform. At this time he began the publication, with critical apparatus, of *Boetius* (*De Aristimetico*), and Aristotle's *Physics* (1402), *Ethics* (1407), *Metaphysics* (1501) and *Politics* (1506). In 1507 he took up his residence in the Benedictine Abbey of St Germain des Prés, near Paris; this was due to his connexion with the family of Brignonnet (one of whom was the superior), especially with William Brignonnet, cardinal bishop of St Malo (Meaux). He now began to give himself to Biblical studies, the first-fruits of which was his *Quaestiones Psalmorum: Gallicanum, Romanae, Hebraicum, Velox*, *Concilium* (1500); the *Concilium Romanum* was his own version. This was followed by *S. Pauli Epistolas in ex vulgata editione, adjecta intelligenta ex Graeco cum commentaribus* (1512), a work of great independence and judgment. His *De Maria Magdalena et trido Christi disceptatio* (1517) provoked violent controversy and was condemned by the Sorbonne (1521). He had left Paris during the whole of 1520, and, removing to Meaux, was appointed (May 7, 1523) vicar-general to Bishop Brignonnet, and published his French version of the New Testament (1523). This (contemporary with Luther's German version) had the basis of all subsequent translations into French. From this, in the same year, he extracted the versions of the Gospels and Epistles "à l'usage du diocëse de Meaux." The prefaces and notes to both these expressed the view that Holy Scripture is the only rule of doctrine, and that justification is by faith alone. He incurred much hostility, but was protected by Francis I and the princess Margaret. Francis being in captivity after the battle of Pavia (February 25, 1529), Faber was condemned and his works suppressed by commission of the parlement; these measures were again pressed on the return of Francis. He published *Le Psaulier de David* (1535), and was appointed royal librarian at Blois (1526); his version of the Pentateuch appeared two years later. His complete version of the Bible (1530), on the basis of Jerome, took the same place as his version of the New Testament. Margaret (now queen of Navarre) led him to take refuge (1531) at Nérac from persecution. He is said to have been visited (1533) by Calvin on his flight from France. He died in 1536 or 1537. He was the author of *Opus adversus novum gaudem dogmata Lutheri* (1522), and appeared as a disputant against Zwingli at Zürich (1523). He followed his *Malleus in haeresin Luthervanam* (1524). Among his efforts to stem the tide of Protestant innovation was the establishment of a training-house for the maintenance and instruction of popular preachers, drawn from the lower ranks, to compete with the orators of reform. In 1526 he became court preacher to the emperor Ferdinand, and in 1527 and 1528 was sent by him as envoy to Spain and England. He approved the death by burning of Balthasar Hubmeier, the Baptist, at Vienna on the 10th of March 1528. In 1531 he was consecrated bishop of Vienna, and combined this (till 1538) the administration of the diocese of Neustadt. He died at Vienna on the 21st of May 1541. His works were collected in three volumes, 1537, 1540 and 1541.

See C. E. Kettner, *Diss. de J. Fabri Vita Scripturisque* (1777); Wagenmann and Egli in Herzog-Hauck's *Realencyclopadie* (1898).

**FABER, ABRAHAM DE** (1599-1666), marshal of France, was the son of Abraham Fabert, seigneur de Moulins (d. 1638), a famous printer who rendered great services, civil and military, to Henry IV. At the age of fourteen he entered the *Gardes françaises*, and in 1618 received a commission in the Piedmont regiment, becoming major in 1627. He distinguished himself repeatedly in the constant wars of the period, notably in La Rochelle and at the siege of Exilles in 1630. His bravery and engineering skill were again displayed in the sieges of Avesnes and Maubeuge in 1637, and in 1642 Louis XIII. made him governor of the recently-acquired fortress of Sedan. In 1651 he became lieutenant-general, and in 1654 at the siege of Stenay he introduced new methods of siegecraft which anticipated in a measure the great improvements of Vauban. In 1658 Fabert was made a marshal of France, being the first commoner to attain that rank. He died at Sedan on the 17th of May 1660.
FABIAN-FABIUS

See Histoire du maréchal de Fabert (Amsterdam, 1697); P. Barre, Vie de Fabert (Paris, 1752); A. Fellen, Le Premier Maréchal de France plébéien (Paris, 1889); Bourelle, Le Maréchal Fabert (Paris, 1886).

FABIAN [FABIANUS], SAINT (d. 250), pope and martyr, was chosen pope, or bishop of Rome, in January 236 in succession to Marcellus. (Hist. Eccl., v. 23). He is said to have lived in peace, having assembled in Rome to elect a new bishop, saw it done, and alighted upon the head of Fabian, a stranger to the city, who was thus marked out for this dignity, and was at once proclaimed bishop, although there were several famous men among the candidates for the vacant position. Fabian was martyred during the persecution under the emperor Decius, his death taking place on the 2oth of January 250, and was buried in the catacomb of Callixtus, where a memorial has been found. He is said to have baptized the emperor Philip and his son, to have done some building in the catacombs, to have improved the organization of the church in Rome, to have appointed officials to register the deeds of the martyrs, and to have founded several churches in France. His deeds are thus described in the Liber Pontificalis: "Hic regiones dividit diaconibus et fictit vii subdiaconos, qui vii notaria imminenter, ut gestas martyrum integro fideliIter colligent, et multas fabicas per cymetria fieri praecipit." Although there is very little authentic information about Fabian, there is evidence that his episcopate was one of great importance in the history of the early church. He was highly esteemed by Cyprian, bishop of Carthage; Novatian refers to his nobilitas memoriae, and he corresponded with Origen. One authority refers to him as P. Calixtus I.

See the article on "Fabian" by A. Harnack in Herzog-Hauck's Realencyklopädie, Band v. (Leipzig, 1898).

FABIIUS, the name of a number of Roman soldiers and statesmen. The Fabian gens was one of the oldest and most distinguished patrician families of Rome. Its members claimed descent from Hercules and a daughter of the Arcadian Evander. From the earliest times it played a prominent part in Roman history, and was one of the two gentes exclusively charged with the management of the most ancient festival in Rome—the Lupercalia (Ovid, Fasti, ii. 375). The chief family names of the Fabian gens or clan, in republican times, were Vibulanos, Ambustus, Maximus, Buteo, Pitor, Dorso, Labeo; with surnames Verrucosus, Rullanos, Gurges, Aemilianus, Allobrogicus (all of the Maximus branch). The most important members of the family are the following:

1. Marcus Fabius Ambustus, pontifex maximus in the year of the capture of Rome by the Gauls (390). His three sons, Quintus, Numerius, and Caeso, although they had been sent as ambassadors to the Gauls when they were besieging Clusium, subsequently took part in hostilities (Livy v. 35). The Gauls thereupon demanded their surrender, on the ground that they had violated the law of nations; the Romans, by way of reply, elected them consular tribunes in the following year. The result was the march of the Gauls upon Rome, the battle of the Allia, and the capture of the city (Livy vi. 1).

2. Q. Fabius Maximus, surnamed Rullinianus or Rullus, master of the horse in the second Samnite War to L. Papirius Cursor, by whom he was degraded for having fought the Samnites contrary to orders (Livy viii. 30), in spite of the fact that he gained a victory. In 315, when dictator, he was defeated by the Samnites at Lautulae (Livy ix. 23). In 310 he defeated the Etruscans at the Vadimonian Lake. In 205, consul for the fifth time, he defeated, at the great battle of Sentinum, the combined forces of the Etruscans, Umbrians, Samnites and Gauls (see ROME: History, II. "The Republic"). As censor (304) he altered the arrangement of Appius Claudius Cæcrops, whereby the freedmen were taken into all the tribes, and limited them to the four city tribes. For this he is said to have received the title of Maximus, as the deliverer of the comitia from the rule of the mob (Livy ix. 60), but there is reason to think that this title was first conferred on him by his son. It is probable that his achievements were greatly exaggerated by historians favourable to the Fabian house.

3. Quintus Fabius Maximus, surnamed Verrucosus (from a war on his lip), Opicula ("the lamb," from his mild disposition), and Cunctator ("the delay," from his cautious tactics in the war against Hannibal), grandson of the preceding. He served his first consulship in Liguria (133 B.C.), was censor (230) and consul for the second time (228). In 218 he was sent to Carthage to demand satisfaction for the attack on Saguntum (Livy xx. 18). According to the well-known story, he held up a fold of his toga and offered the Carthaginians the choice between peace and war. When they declared themselves indifferent, he let fall his toga with the words, "Then take war." After the disastrous campaign on the Trebia, and the defeat on the banks of the Trasimene Lake, Fabius was named dictator (Livy calls him pro-dictator, since he was nominated, not by the consuls, but by the people) in 217, and began his tactics of "masterly inactivity." Maneuvering among the hills, where Hannibal's cavalry were useless, he cut off his supplies, harassed him incessantly, and did everything except fight. His steady adherence to his plan caused dissatisfaction at Rome and in his own camp, and aroused the suspicion that he was merely endeavouring to prolong his command. Minucius Rufus, his master of the horse, seized the opportunity, during the absence of Fabius at Rome, to make an attack upon the enemy which proved successful. The people, more than ever convinced that a forward movement was necessary, divided the command between Minucius and Fabius (Livy xxii. 15, 24; Polybius iii. 88). Minucius was led into an ambuscade by his own consulship and was captured, but was released by the temporary arrival of Fabius. Minucius confessed his mistake and henceforth submitted to the orders of Fabius (Livy xxii. 35). At the end of the legal time of six months Fabius resigned the dictatorship and the war was carried on by the consuls. The result of the abandonment of the Fabian tactics was the disaster of Cannae (216). In 215 and 214 (as consul for the third and fourth times) he was in charge of the operations against Hannibal together with Claudius Marcellus (Livy xxii. 39). He laid siege to Capua, which had gone over to Hannibal after Cannae, and captured the important position of Casilinium; but the consuls, who had been occupied by Hannibal for three years (Livy xxii. 15; Polybius xiii. 2; Plutarch, Fabius). He died in 203. Fabius was a strenuous opponent of the new aggressive policy, and did all he could to prevent the invasion of Africa by Scipio. He was distinguished for calmness and prudence, while by no means lacking in courage when it was required. In his later years, however, he became morose, and showed jealousy of rising young men, especially Scipio (Life by Plutarch; Livy xx-xxx; Polybius iii. 87-106).

4. Q. Fabius Maximus Aemilianus, eldest son of L. Aemilius Fabius, adopted by Fabius Cunctator. He served in the last Macedonian War (168), and, as consul, defeated Viahritius in Spain (Livy, Epit. 52). He was the pupil and patron of Polybius (Polybius xviii., xxxix. 6, xxii. 8-10; Livy xiv. 35).

5. Q. Fabius Maximus Allobrogicus, son of the above, consul 121 in Gaul. He obtained his surname from his victory over the Allobroges and Arverni in that year (Vell. Pat. ii. 10; Eutropius iv. 39). As censor (108) he erected the first triumphal arch.

6. Q. Fabius Vibulanos, with his brothers Caeso and Marcus, filled the consulship of seven years in succession (485-479 B.C.). In the last year there was a reaction against the family, in consequence of Caeso espousing the cause of the plebeians. Therupon the Fabio—to the number, it is said, of 306 patricians, with some 5000 dependents—emigrated from Rome under the leadership of Caeso, and settled on the banks of the Cremera, a few miles above Rome. For two years the exiles continued to be the city's chief defence against the Veientes, until at last they were surprised and cut off. The only survivor of the gens was Quintus, the son of Marcus, who apparently took no part in the battle. The story that he had been left behind at Rome on account of his youth is not true, as he was consul ten years afterwards. This Quintus was consul in 467, 465 and 450, and a member of the second decemvirate in 450, on the fall of which he went into voluntary exile (Livy ii. 42, 48-50, iii. 1, 0, 41, 38, vi. 1; Dion. Halic. viii. 82-86, ix. 14-22; Ovid, Fasti, ii. 195).
The Fabian name is met with as late as the 2nd century A.D. A complete list of the Fabian will be found in de Vit's Omomastic; see also W. N. de Ries, Disputatio de Gentia Fabia (1850), containing an account of 57 members of the family.

FABII PICTOR, QUINTUS, the father of Roman history, was born about 254 B.C. He was the grandson of Gaius Fabius, who received the surname Pictor for his painting of the temple of Salus (502). He took an active part in the subjugation of the Gauls north of Italy (496), and the battle of Cannae (216) was employed by the Romans to proceed to Delphi in order to consult the oracle of Apollo. He was the earliest prose writer of Roman history. His materials consisted of the Annales Maximi, Commentarii Consularis, and similar records; the chronicles of the great Roman families; and his own experiences in the Second Punic War. He is also said to have made much use of the Greek historian Dioecles of Paphreatus. His work, which was written in Greek, began with the arrival of Aeneas in Italy, and ended with the Hannibalic war. Although Polybius and Dionysius of Halicarnassus frequently find fault with him, they first uses him as his chief authority for the Second Punic War. A Latin version of the work was in existence in the time of Cicero, but it is doubtful whether it was by Fabius Pictor or by a later writer with whom he was confused—Q. Fabius Maximus Servilanus (consul 142); or there may have been two annalists of the name of Fabius Pictor.

Fragments in H. Peter, Historiarum Romanarum Fragmenta (1853); see also Aviti and Livy, and Teuffel-Schwabe, History of Roman Literature, § 116.

FABLE (Fr. fable, Lat. fabula). With certain restrictions, the necessity of which will be shown in the course of the article, we may accept the definition of "fable" which Dr Johnson proposes in his Life of Gay: "A fable or apologue seems to be, in its genuine state, a narrative in which beings irrational, and sometimes inanimate (arbres loquantur, non tantum ferae), are, for the purpose of moral instruction, feigned to act and speak with human interests and passions." The description of La Fontaine, the greatest of fabulists, is a poetic rendering of Johnson's definition: "Fables in sooth are not what they appear: Our moralists are mice, and such small deer. We yawn at sermons, but we gladly turn To moral tales, and so amused we learn."

The fable is distinguished from the myth, which grows and is not made, the spontaneous and unconscious product of primitive fancy as it plays round some phenomenon of natural or historical fact. The literary myth, as for, instance, the legend of Pandora in Hesiod or the tale of Er in the Republic of Plato, is really an allegory, and differs from the fable in so far as it is self-interpreting; the story and the moral are intermingled throughout. Between the parable and the fable there is no clear line of demarcation, and theologians like Trench have unwarrantedly made an opposition between them. Fables and parables are, according to C. S. Jones, the "soudest distinction is drawn by Neander; in the fable human passions and actions are attributed to beasts; in the parable the lower creation is employed only to illustrate the higher life and never transgresses the laws of its kind. But whether Jotham's apologue of the trees choosing a king, perhaps the first recorded in literature, should be classed as a fable or a parable is hardly worth disputing. Lastly, we may point out the close affinity between the fable and the proverb. A proverb is often a condensed or fossilized fable, and not a few fables are amplified or elaborated proverbs.

The history of the fable goes back to the remotest antiquity, and Aesop has even less claim to be reckoned the father of the fable than has Homer to be entitled the father of poetry. The fable has its origin in the universal impulse of men to express their thoughts in concrete images, and is strictly parallel to the use of metaphor in language. It is the most widely diffused than not the most primitive form of literature. Though it has fallen from its high place it still survives, as in J. Chandler Harris's Uncle Remus and Rudyard Kipling's Jungle Book. The Arab of to-day will invent a fable at every turn of the conversation as the readiest form of pleasant occupation. In the days of the Patmore it is told how an impromptu fable of his about the pious dowress found its way into Catholic books of devotion.

With the fable, as we know it, the moral is indispensable. As La Fontaine puts it, an apologue is composed of two parts, body and soul. The body is the story, the soul the morality. But if we revert to the earliest type we shall find that this is no longer the case. In the primitive beast-fable, which is the direct progenitor of the Aesopian fable, the story is told simply for its own sake, and is as innocent of any moral as the fairy tales of Little Red Riding-Hood and Jack and the Beanstalk. Thus, in a legend of the Flathead Indians, the Little Wolf found in cloud-land his grandfathers the Spiders with their grizzled hair and long crooked nails, and they spun balls of thread to let him down to earth; when he came down and found his wife the Speckled Duck, whom the Old Wolf had taken from her, she fled in confusion, and this is why she lives and dives alone to this very day. Such animal myths are as common in the New World as in the Old, and abound from Finland and Kamchatka to the Hottentots and Australasians. From the story invented as the one above quoted, to account for some peculiarity of the animal world, or told as a pure exercise of the imagination, just as a sailor spins a yarn about the sea-serpent, to the moral apologue the transition is easy; and that it has been effected by savages unaided by the higher races seems sufficiently proved by the tales quoted by E. B. Tylor (Primitive Culture, vol. i. p. 411). From the beast-fables of savages we come we come to the Oriental apologues, which we still possess in their original form. The East, the land of myth and legend, is the natural home of the fable, and Hindu was the birthplace, if not of the original of these tales, at least of the earliest or oldest. The fables of Aesop are those of the Indian Panchatantra (2nd century n.c.), or fables of the Brahma Vishnu Sarman, have been translated from Sanskrit into almost every language and adapted by most modern fabulists. The Kalidha and Dimna (names of two jackals), or fables of Bidpai (or Pilpai), passed from India to western Europe through the successive stages of Pahlavi (ancient Persian), Arabic, Greek, Latin. By the end of the 16th century there were Italian, French and English versions. There is an excellent Arabic edition (Paris, 1816) with an introduction by Sylvestre de Sacy. The Hitopadesa, or "Useful instruction," was the first form of the work, and of it there are three translations into English by Dr Charles Wilkins, Sir William Jones and Professor F. Johnson. The Hitopadesa is a complete chaplet of fables loosely strung together, but connected so as to form something of a continuous story, with moral reflections freely interspersed, purporting to be written for the instruction of some dissolute young princes. Thus, in the first fable a flock of pigeons see the grains of rice which a fowler has scattered, and are about to descend on them, when the king of the pigeons warns them by telling the fable of a traveller who being greedy of a bracelet was devoured by a tiger. They neglect his warning and according to Aesop's fable, but are accordingly devoured by the king of the mice, who tells the story of the Deer, the Jackal and the Crow, to show that no real friendship can exist between the strong and the weak, the beast of prey and his quarry, and so on to the end of the volume. Another book of Eastern fables is well worthy of notice, Buddaghosha's Parables, a commentary on the Dhammapada or Buddha's Paths of Virtue. The original is in Pali, but an English translation of the Burmese version was made by Captain T. Rogers, R.E.

From Hindustan the Sanskrit fables passed to China, Tibet and Persia; and they have must have reached Greece at an early age, for many of the fables which passed under the name of Aesop are identical with those of the East. Aesop to us is little more than a name, though, if we may trust a passing notice in Herodetus (ii. 134), he must have lived in the 6th century B.C. Probably his fables were never written down, though several are ascribed to him by Xenophon, Aristotle, Plutarch and other Greek writers, and Plato represents Socrates as beguiling his last days by versifying such as he remembered. Aristophanes alludes to them as merry tales, and Plato, while excluding the poets from his ideal republic, admits Aesop as a moral teacher. Of the fables which are ascribed to him, the Parthenos Sappho is the most distinguished, and that by the name of Babrius or Babrias, a Greek probably of the 3rd century A.D., who rendered them in choliambic verse. These,
which were long known in fragments only, were recovered in a MS. found by M. Minas in a monastery on Mount Athos in 1842, now in the British Museum. An inferior version of the same in Latin iambics was made by Phaedrus, a slave of Thracian origin, brought to Rome in the time of Augustus and manumitted by him. Phaedrus's prose fabulae are polished in character verse the rough-hewn blocks from Asop's quarry; but the numerous allusions to contemporary events, as, for example, his hit at Sejanus in the Frogs and the Sun, which brought upon the author disgrace and imprisonment, show that many of them are original or free adaptations. For some time scholars doubted as to the genuineness of Phaedrus's fables, but their doubts have lately been dispelled by a closer examination of the MSS. and by the discovery of two verses of a fable on a tomb at Apulum in Dacia. Phaedrus's style is simple, clear and brief, but dry and unpoetical; and, as Lessing has pointed out, he often falls into absurdities when he deserts his original. For instance, in Asop the dog with the meat in his mouth sees his reflection in the water as he passes over a bridge; Phaedrus makes him see it as he swims across the river.

To sum up the characteristics of the Asopian fable, it is artless, simple and transparent. It affects no graces of style, and we hardly need the text with which each concludes, διδότα δούλος ήρι, κ.λ.η. The moral inculcated is that of \textit{Proverbial Philosophy} and \textit{Poor Richard's Almanacks}. Asop is no maker of phrases, but an oracle who wishes to gain some point or induce some course of action. It is the Asopian type that Aristotle has in view when he treats of the fable as a branch of rhetoric, nes of poetry?

The Latin race was given to moralizing, and the language lent itself to crisp and pointed narrative, but they lacked the free play of fancy, the childlike "make-believe," to produce a national body of fables. With the doubtful exception of Phaedrus, we possess nothing but solitary examples, such as the famous apologue of Menenius Agrippa to the Plebs and the exquisite Town Mouse and Country Mouse of Horace's \textit{Satires}.

The fables of the rhetorician Aphantus about A.D. 400 in Greek prose, and those in Latin elegiac verse by Avianus, used for centuries as a text-book in schools, form in the history of the apologue a link between classical and medieval times. In a Latin dress, sometimes in prose, sometimes in regular verse, and sometimes in rhymed stanzas, the fable contributed, with other kinds of narratives, to make up the huge mass of stories which has been bequeathed to us by the monastic libraries. These served more uses than one. They were at once easier and safer reading than the classics. To the lazy monk they stood in place of novels; to the more industrious and gifted they furnished an exercise on a par with Latin verse composition in our public schools; the more original transformed them into fabliaux, or embodied them in edifying stories, as in the \textit{Gesta Romanorum}. It is not in the \textit{Speculum Doctrice of Vincent de Beauvais}, a Dominican of the 12th century, nor in the collection of his contemporary Odo de Certon, an English Cistercian, nor in Planudes of the 14th century, whose one distinction is to have added to the fables a life of Asop, that the direct lineage of La Fontaine must be traced. It is the \textit{fabliaux} that inspired some of his best fables—the Lion's Court, the Young Widow, the Coach and the Fly.

As the supremacy of Latin declined and modern languages began to be turned to literary uses, the fable took a new life. Not only were there numerous adaptations of Asop, known as \textit{fabliaux}, but Marie de France in the 13th century composed many original fables, some rivaling La Fontaine's in simplicity and graceful ness. Later, also, fables were not wanting, though not numerous, in the English tongue. Chaucer has given us one, in his Nonne Preste's Tale, which is an expansion of the fable \textit{Don Coc et don Werpil} of Marie de France; another is Lydgate's tale of The Churl and the Bird.

Several of Odo's tales, like Chaucer's story, can be ultimately traced to the History of Reynard the Fox. This great beast-epic has been referred by Grimm as far back as the 10th century, and is known to us in three forms, each with independent episodes, but all woven upon a common basis. The Latin form is probably the earliest, and the poems \textit{Reynardus} and \textit{Yesengrinus} date from the 11th or 12th century. Next come the German versions. The most ancient, that of aminister Heinrich der Glichesz (probably a Swabian), was analysed and edited by Grimm in 1840. The French poem of more than 30,000 lines, the \textit{Roman du R{\textsuperscript{en}}ard}, belongs probably to the 13th century. In 1480 appeared \textit{Reynke de Voss}, almost a literal version in Low Saxon of the Flemish poem of the 12th century, \textit{Reinart de Vos}. Hence the well-known version of Goethe into modern German hexameters was taken. The poem has been well named "an unholy world Bible." In it the Asopian fable received a development which was in several respects quite original. We have here no short and unconnected stories. Materials, partly borrowed from older apologues, but in a much greater proportion, are worked up into one long and systematic tale. The moral, so prominent in the fable proper, shrinks so far into the background, that the epic might be considered a work of pure fiction, an animal romance. The attempts to discover in it personal satire have signally failed; some critics deny even the design to represent human conduct at all; and we can scarcely get nearer to its signification than by regarding it as being, in a general way, what Carlyle has called "a parody of human life." It represents a contest maintained successfully, by selfish craft and audacity, against enemies of all sorts, in half-barbarous yet independent society. With his weakest foes, like Chauntecleere the Cock, Reynard uses brute-force; over the weak who are protected, like Kiward the Hare and Belin the Ram, he is victorious by uniting violence with cunning; Bruin, the dull, strong, formidable Bear, is humbled by having greater power than his own enlashed against him; and the most dangerous of all the fox's enemies, Isengrim, the obstinate, 'greedy and implacable Wolf, after being baffled by repeated strokes of malicious ingenuity, forces Reynard to a single combat, but even thus is not a match for his dexterous adversary. The knavish fox has allies worthy of him in Grimbrat the watchful badger, and in his own aunt Dame Rukenaue, the learned She-ape; and he plays at his pleasure on the simple credulity of the Lion-King, the image of an impotent feudal sovereign. The characters of these and other brutes are kept up with a rude kind of consistency, which gives them great liveliness; many of the incidents are devised with much force of humour; and the sly hits at the weak points of medieval polity and manners and religion are incessant and palpable.

It is needless to trace the fable, or illustrations borrowed from fables, that so frequently occur as incidental ornamental in the older literature of England and other countries. It has appeared in every modern European language. The best has probably become much more important, and has hardly ever exhibited much originality either of spirit or of manner. In English, Prior transplanted from France some of La Fontaine's ease of narration and artful artlessness, while Gay took as his model the \textit{Contes} rather than the Fables. Gay's fables are often political satires, but some, like the Fox on his Deathbed, have the true ring, and in the Hare with many Friends there is genuine pathos. To Dryden's spirited remodelings of old poems, romances and fabliaux, the name of fables, which he was pleased to give them, is quite inapplicable. In the 17th and 18th centuries, Gellert, both famous in their day and the latter called by Goethe, are quite forgotten; and even Lessing's fables are read by few but schoolboys. In Spanish, Yriarte's fables on literary subjects are sprightly and graceful, but the critic is more than the fabulist. A spirited version of the best appeared in \textit{Blackwood's Magazine}, 1839. Among Italians Pignotti is famous for versatility and command of rhythm, as amongst Russians is Kriloff for his keen satire on Russian society. He has been translated into English by Ralston.

France alone in modern times has attained any pre-eminence in the fable, and this distinction is almost entirely due to one Marie de France in the 13th century. Gilles Corrozet, Guillaume Haudenas and Guillaume Gourou in the 16th, are now
studied mainly as the precursors of La Fontaine, from whom he may have borrowed a stray hint or the outline of a story. The unique character of his work has given a new word to the French language: other writers of fables are called fabulistes, La Fontaine is named le fablier. He is a true poet; his verse is entirely unmodulated; his love of nature often reminds us of Virgil, as do his tenderness and pathos (see, for instance, The Two Pigeons and Death and the Woodcutter). He is full of sly fun and delicate humour; like Horace he satirizes without wounding, and "plays around the heart." Lastly, he is a keen observer of men. The whole society of the 17th century, its greatness and its foibles, its luxury and its squallor, from Le grand monarque to the poor monant, from his majesty the fion to the courtier of an ape, is painted to the life. To borrow his own phrase, La Fontaine's fables are "une amble comède à cent actes et vers." Routon of his best to discredit the Fables as immoral and corruptors of youth, but in spite of l'Émile they are studied in every French school and are more familiar to most Frenchmen than their brevity. Among the successors of La Fontaine the most distinguished is Florian. He justly estimates his own merits in the pretty apologue that he prefixed to his Fables. He asks a sage whether a fabulist writing after La Fontaine would not be wise to consign his work to the flames. The sage replies by a question: "What would you say did some sweet, ingenious Maid of Athens refuse to let herself be seen because there was once a Helen of Troy?"

The answer is of more importance than the question against the French school of fabulists. "With La Fontaine himself," says Lessing, "I have no quarrel, but against the imitators of La Fontaine I enter my protest." His attention was first called to the fable by Gellert's popular work published in 1746. Gellert's fables were closely modelled after La Fontaine's, and were a vehicle for lively railings against the fair sex, and hits at contemporary follies. Lessing's early essays were in the same style, but his subsequent study of the history and theory of the fable led him to discard his former model as a perversion of later times, and the "Fable," published in 1759, is not an imitation of his riper views. Lessing's fables, like all that he wrote, display his vigorous common sense. He has, it is true, little of La Fontaine's curioso felicitas, his sly humour and lightness of touch; and Frenchmen would say that his criticism of La Fontaine is an illustration of the fable of the sour grapes. On the other hand, he has the rare power of looking at both sides of a moral problem; he holds a brief for the stupid and the feeble, the ass and the lamb; and in spite of his formal protest against poetical ornament, there is in not a few of his fables a vein of true poetry, as in the Sheep (ll. 13 and Jupiter and the Sheep (ll. 18). But the monograph which introduced the Fabliau is of more importance than the fables themselves. According to Lessing the ideal fable is that of Aesop. All the elaborations and refinements of later authors, from Phaedrus to La Fontaine, are perversions of this original. The fable is essentially a moral precept illustrated by a single example, and it is the lesson thus enforced which gives to the fable its unity and makes it a work of art. The illustration must be either an actual occurrence or represented as such, because a fictitious case invented ad hoc can appeal but feebly to the reader's judgment. Lastly, the fable requires a story or connected chain of events that will not make a fable, but is only an emblem. We thus arrive at the following definition: "A fable is a relation of a series of changes which together form a whole. The unity of the fable consists herein, that all the parts lead up to an end, the end for which the fable was invented being the moral precept." We may notice in passing a problem in connexion with the fable which has long been debated, but never satisfactorily resolved till Lessing took it in hand—Why should animals have been almost universally chosen as the chief dramatis personae? The reason, according to Lessing, is that animals have distinct characters which are known and recognized by all. The fabulist who writes of Britannicus and Nero appeals to the few who know Roman history. The Wolf and the Lamb comes home to every one whether learned or simple. But, besides this, human sympathies obscure the moral judgment; hence it follows that the fable, unlike the drama and the epos, should abstain from all that is likely to arouse our prejudices or our passions. In this respect the Wolf and the Lamb of Aesop is a more perfect fable than the Rich Man and the Poor Man's Ewe Lamb of Nathan. Lessing's analysis of the definition of the fable, though he seems himself unconscious of the scope of his discovery, is in truth a death-warrant. The beast-fable arose in a primitive age when men firmly believed that beasts could talk and reason, that any wolf they met might be a were-wolf, that a peacock might be a Pythagoras in disguise, and an ox or even a cat a being worthy of their worship. To this succeeded the second age of the fable, which belongs to the same stage of culture as the Hebrew proverbs and the gnomic poems of Greece. That honesty is the best policy, that death is common to all, seemed to the men of that day profound truths worthy to be embalmed in verse or set off by the sound of story or anecdote. Last comes an age (if high literature is to be so termed) which tolerates the trite morals and hackneyed tales for the sake of the exquisite setting, and is amused at the wit which introduces topics and characters of the day under the transparent veil of animal life. Such an artificial product can be nothing more than the fashion of a day, and must, like pastoral poetry, die a natural death. A serious moralist would hardly choose to form inculcate, like Mandeville in his Fable of the Bees, a new doctrine in morals, for the moral of the fable must be such that he who runs may read. A true poet will not care to masquerade in the role of schoolmaster, or use his fables as a mere old-world maxim. Yet Taine in France, Lowell in America, and J. A. Froude in England have proved that the fable as one form of literature is not yet extinct, and is capable of new and unexpected developments.

FABLIAU. The entertaining tales in eight-syllable rhymed verse which form a marked section of French medieval literature are called fabliaux, the word being derived by Littré from fabiel, a diminutive of fable. It is a mistake to suppose, as is frequently done, that every legend of the middle ages is a fabliau. In the 12th century a clear distinction is made between songs of chivalry, war or love, and fabliaux, which are recitals of laughter. A fabliau always related an event; it was usually brief, containing not more than 400 lines; it was neither sentimental, religious nor supernatural, but comic and gay. M.M. de Montaiglon and Raynaud, who have closely investigated this class of literature, consider that about 150 fabliaux have come down to us more or less intact; a vast number have doubtless disappeared. It appears from a phrase in the writings of the trouvère, Henri d' Andeli, that the fabliau was not thought of as being copied or passed on. The wonder, then, is that so many of these ephemeral compositions have been preserved. Arguments brought forward by M. Joseph Bédier, however, tend to show that we need not regret the disappearance of the majority of the fabliaux, as those which were copied into MSS. were those which were felt to be of the greatest intrinsic value. As early as the 8th century fabliaux must have existed, since the faithful are forbidden to take pleasure in these fabulas insanes by the Paenitential of Egbert. But it appears that all the early examples are lost.

In the opinion of the best scholars, the earliest surviving fabliau is that of Richelet, which dates from 1150. This is a rough and powerful study of the coarse life of the day, with little plot, but engaged with a realistic picture of manners.
Such poems, but of a more strictly narrative nature, continued to be produced, mainly in the north and north-east of France, until the middle of the 14th century. Much speculation has been expended on the probable sources of the tales which the trouvères told. The Aryan theory, which saw in them the direct influence of India upon Europe, has now been generally abandoned. It does not seem probable that any ancient or exotic influences were brought to bear upon the French jongleurs, who simply invented or adapted stories of that universal kind which springs unsown from every untilled field of human society. More remarkable than the narratives themselves is the spirit in which they are told. This is full of the national humour and the national irony, the true esprit gaullais. A very large section of these popular poems deals satirically with the pretensions of the clergy, and they are the famous Prêtre aux mâres, the Prêtre qui dit la Passion and Les Perdix. Some of these are innocently sly; others are singularly depraved and obscene. Another class of fabliaux is that which comprises jests against the professions; in this, the most prominent example is Le Vilain Mire, a satire on doctors, which curiously predicts the Médicin malgré lui of Molière. There are also tales whose purpose is rather voluptuous than witty, and whose aim is to excite libertinage and render marriage ridiculous. Among these are prominent Court Moutel and the Troubadour. It is true that if fabliaux represent a strain of irony or oddity, such familiar classical stories as those of Narcissus, and Pyramus and Thisbe. It is rarely that any elevation of tone raises these poems above a familiar and even playful level, but there are some that are almost idealistic. Among these the story of a sort of Sisyphus errant, Le Chevalier de Barisel, offers an ethical interest which lifts it in certain respects above all other surviving fabliaux. An instance of the pathetic fabliau is Housse Partie, a kind of primitive version of the story of King Lear.

In composing these pieces, of very varied character, the jongleurs have shown an art which was in many respects rudimentary, but sincere and simple. The student of language finds the rich vocabulary of the fabliaux much more attractive to him than the conventionality of the serious religious and amatory poems of the same age. The object of the writers was the immediate amusement of their audience; by reference to familiar things, they hoped to arouse a quick and genuine merriment. Hence their incorrectness and their negligence are balanced by a delightful ease and absence of pedantry, and in the fabliaux we get closer than elsewhere to the living diction of the French of the time. It is true that if fabliaux have lost too much of their force as an art, to judge these pieces, we may find ourselves obliged to condemn them altogether. An instructed French critic, vexed with their faults, has gone so far as to say that “the subjects of these tales are degrading, their inspiration nothing better than flat and cruel derision, their distinguishing features rascality, vulgarity and platitude of style.” From one point of view, this condemnation of the fabliau is hardly so severe. But such scholars as Gaston Paris and Paul Meyer have not failed to emphasize other sides to the question. They have praised, in the general laxity of style and garrulity of the middle ages, the terseness of the jongleurs; in the period of false ornament, their fidelity to nature; in a time of general vagueness, the sharp and picturesque outlines of their art. One feature of the fabliaux, however, cannot be praised and yet must not be overlooked. In no other section of the world’s literature is the scorn and hatred of women so prominent. It is difficult to account for the anti-feminine rage which pervades the fabliaux, and takes hideous shapes in such examples as Le Valet aux deux femmes, Le Pêcheur de Pont-sur-Seine and Chicheface et Bigorne. Probably this was a violent reaction against the extravagant cult of woman as expressed in the contemporary lais as well as in the legends of saints. The exaggeration was not greater in the one case than in the other, and it is probable that the exaltation was made endurable to those who listened to the trouvères by the corresponding degradation. We must remember, too, that those who listened were not nobles or clerks, they were the common people. The fabliaux were fabellae ignobilium, little stories told to amuse persons of low degree, who were irritated by the moral pretensions of their superiors.

The names of about twenty of the authors of fabliaux have been preserved, although in most cases nothing is known of their personal history. The most famous part of this class of writing is the man whose name, or more probably pseudonym, was Rutebeuf. He wrote Frère Denys et Le Sacristain, while to him is attributed the Dit d’Aristote, in the course of which Aristote gives good advice to Alexander. Fabliaux, however, form but a small part of the work of Rutebeuf, who was a satirical poet of wide accomplishment and varied energy. Most of the jongleurs who wrote these merry and indecent tales in octosyllabic verse were persons of less distinction. Henri d’Andeli was an ecclesiastic who made a name for himself, it is supposed, to the cathedral of Rouen. Jean de Conde, who flourished in the court of Henry II from 1310 to 1349, and who is the latest of the genuine writers of fabliaux, lived in comfort and security, but most of the professional jongleurs seem to have spent their years in a Bohemian existence, wandering among the clergy and the merchant class, alternately begging for money and food and reciting their mocking verses.

The principal authorities for the fabliaux are MM. Antoine de Monteil, Emile Lombard and Germaine de Staël. In 1802, between 1872 and 1890. This edition corrected and supplemented the very valuable labours of Méon (1808–1823) and Jubinal (1829–1842). The works of Henri d’Andeli were edited by M. A. Héron of Sceaux, and those of Rutebeuf by him and his son, Pretre of Conde, in 1890. The edition of the fabliaux of Rutebeuf by G. F. de Gaule was published in 1891. See also the editions of separate fabliaux by Gaston Paris, Paul Meyer, Ebeling, Jouvenel and other modern scholars. M. Joseph Bedier’s Les Fabliaux (1895) is a useful summary of critical opinions on the entire subject. (E. G.)

FABRE, FERDINAND (1830–1898), French novelist, was born at Béziers, in Hérault, a very picturesque district of the south of France, which he made completely his own in literature. He was the son of a local architect, who failed in business, and Ferdinand was brought up by his uncle, the Abbé Fulcan Fabre, at Camplong among the mulberry woods. From childhood to early youth he has given a charming account in Ma Vocation (1880). He was destined to the priesthood, and was sent for that purpose to the seminary of St Pons de Thomières, where, in 1848, he had, as he believed, an ecstatic vision of Christ, who warned him “It is not the will of God that thou shouldst be a priest.” He had now to look about for a profession, and, after attempting medicine at Montpellier, was articled as a lawyer’s clerk in Paris. In 1853 he published a volume of verses, Peuples des bords, in which he spoke with truth and dash, and besought from the aged and humble and apparently without advantage. After some eight or nine years of country life he reappeared in Paris, with the MS. of his earliest novel, Les Courbetons (1862), in which he treated the subject which was to recur in almost all his books, the daily business of country priests in the Cévennes. This story enjoyed an immediate success with the literary class of readers; George Sand praised it, Sainte-Beuve hailed it in his author “the strongest of the disciples of Balzac,” and it was crowned by the French Academy. From this time forth Fabre settled down to the production of novels, of which at the time of his death he had published about twenty. Among these the most important were Le Chevrier (1865), unique among his works as written in an experimental mixture of Cevenol patois and French of the 16th century; L’Abbé Tigrande, candidat à la papauté (1873), by common consent the best of all Fabre’s novels, a very powerful picture of unscrupulous priestly ambition; Mon Oncle César (1881), a study of the entirely single and tender-hearted country abbé; and Lucifer (1884), a marvellous gallery of serious clerical portraits. In 1883 Fabre was appointed curator of the Lazarin Library, with rooms in the Institute, where, on 11th February 1898, he died after a brief attack of pneumonia. Ferdinand Fabre occupies in French literature an exalted position somewhat analogous to that of Mr Thomas Hardy amongst English writers of fiction. He deals almost exclusively with the population of the mountain villages of Hérault, and particularly with its priests. He loved most of all to treat of the celibate virtues, the strictly ecclesiastical passions, the enduring tension of the young soul drawn between the spiritual
vocation and the physical demands of nature. Although never a priest, he preserved a comprehension of and a sympathy with the clerical character, and he always indignantly denied that he was hostile to the Church, although he stood just outside her borders. Fabre possessed a limited and a monotonous talent, but within his own field he was as original as he was wholesome and contemplative.

See also J. Lemaître, Les Contemporains, vol. ii.; G. Pellissier, Études de littérature contemporaine (1898); E. W. Goosse, French Profiles (1905).

FABRE D’ÉGLANTINE, PHILIPPE FRANÇOIS NAZARE (1730-1794), French dramatist and revolutionist, was born at Carcassonne on the 28th of July 1730. His real name was said to be “Fabre d’Églantine,” being adopted in commemoration of his receiving the golden églantine of Clémence Isaure from the academy of the floral games at Toulouse. After travelling through the provinces as an actor, he came to Paris, and produced an unsuccessful comedy entitled Les Gens de lettres, ou le provincial à Paris (1787). A tragedy, Augusta, produced at the Théâtre Français, was also a failure. One only of his plays, Philinte, ou la suite du Misanthropè (1790), still preserves its reputation. It professes to be a continuation of Molère’s Misanthropè, but the hero of the piece is of a different character from the nominal prototype—an impersonation, indeed, of pure and simple illettrisme. On its connexion with the play was introduced by a preface, in which the author mercilessly satirizes the Optimistes of his rival J. F. Collin d’Harleville, whose Châteaux en Espagne had gained the applause which Fabre’s Présompteux (1789) had failed to win. The character of Philinte had much political significance. Akeste received the highest praise, and evidently represents the citizen patriot, while Philinte is a dangerous aristocrat in disguise. Fabre was president and secretary of the club of the Cordeliers, and belonged also to the Jacobin club. He was chosen by Canton as his private secretary, and sat in the National Convention. He voted for the king’s death, supporting the maxim aut ouest cito et forcer. On its connexion with the affair of the Girondins. After the death of Marat he published a Portrait de l’Ami du Peuple. On the abolition of the Gregorian calendar he sat on the committee entrusted with the formation of the republican substitute, and to him was due a large part of the new nomenclature, with its poetic Pradial and Floréal, its prosaic Primidi and Duodi. The report which he made on the subject, on the 24th of October, has some scientific value. On the 12th of January 1794 he was arrested by order of the committee of public safety on a charge of malversation and forgery; and in connection with the affairs of the Compagnie des Indes. Documents still existing prove that the charge was altogether groundless. During his trial Fabre showed the greatest calmness and sang his own well-known song of Il pleut, il pleut, bergere, rentre tes blancs moutons. He was guillotined on the 5th of April 1794. On his way to the scaffold he distributed his manuscript poems to the people.

A posthumous play, Les Préceptorès, steeped with the doctrines of Rousseau’s Émile, was performed on the 17th of September 1794, and met with an enthusiastic reception. Among Fabre’s other plays are the gay and successful Comœlescent de qualité (1791), and L’Intrigue épistolaire (1791). In the latter play Fabre is supposed to have drawn a portrait of the painter Jean Baptiste Greuze.

The author’s Oeuvres mêlées et posthumes were published at Paris 1802, 2 vols. See Albert Maurin, Galerie hist. de la Rédution française, tome ii.; Jules Jamin, Hist. de la litt. dram.; Chénier, Tableau de la litt. française; F. A. Aulard in the Nouvelle Revue (July 1885).

FABRETTI, RAPHAEL (1618-1700), Italian antiquary, was born in 1618 at Urbino in Umbria. He studied law at Cagli and Urbino, where he took the degree of doctor at the age of eighteen. While in Rome he attracted the notice of Cardinal Lorenzo Imperiali, who employed him successively as treasurer and auditor of the papal legation in Spain, where he remained thirteen years. Meanwhile, his favourite classical and antiquarian studies were not neglected; and on his return journey he made important observations of the relics and monuments of Spain, France and Italy. At Rome he was appointed judge of appellation of the Capitoll, which post he left to be auditor of the legation at Urbino. After three years he returned to Rome, on the invitation of Cardinal Carpegna, vicar of Innocent XI., and devoted himself to antiquarian research, examining with minute care the monuments and inscriptions of the Campagna. He always rode a horse which his friends nicknamed “Marco Pole,” after the Venetian traveller. By Innocent XII. he was made keeper of the archives of the city of St Angelo, a charge which he retained till his death. He died at Fregin, near Rome, on the 28th of January 1700. His collection of inscriptions and monuments was purchased by Cardinal Stoppani, and placed in the ducal palace at Urbino, where they may still be seen.

His work De Aquis et Aquae-ductibus veteri Romae (1680), three dissertations on the topography of ancient Latium, is inserted in Graevius’s Thesaurus, iv. (1677). His interpretation of certain passages in Livy and other classical authors involved him in a dispute with Gronovius, which bore a strong resemblance to that between Milon and Salmadorus, Gronovius addressing Fabretti as Faber Rusticus, and the latter, in reply, speaking of Gronovius and his litititia. In this controversy Fabretti used the pseudonym Iasithue, which he afterwards took as his pastoral name in the Academy of the Arcadians. His other works, De Columba Traiani Syntaxa (Rome, 1683), and Inscriptionum Antiquarum Explicatio (Rome, 1699), throw much light on Roman antiquity. In the former is to be found his explication of a bas-relief, with inscriptions, now in the Capitoll, at representing the war and taking of Troy, known as the Iliac table. Letters and other shorter works of Fabretti are to be found in publications of the time, as the Journal des Savants.

See Crescembeni, La Vie de l’Acad. des Inscriptions; Fabroni, Vitae Italorum, vi. 174; Niccnon, iv. 372; J. Lannius, Memorabilia Italorum eruditio praestantium (Florence, 1742-1748).

FABRIANO, SEVERINO (1792-1849), Italian author and teacher, was born at Spilamberto, Italy, on the 7th of January 1792. Entering the Church, he took up educational work, but in consequence of complete loss of voice he resolved to devote himself to teaching deaf mutes, and founded a small school specially for them. This school the duke of Modena made into an institute, and by a special authority from the pope a teaching staff of nuns was appointed. Fabriano’s method of instruction is summed up in his Logical Letters on Italian Grammar (1847). He died on the 27th of April 1849.

FABRIANO, a town of the Marches, Italy, in the province of Ancona, from which it is 44 m. S.W. by rail, 1066 ft. above sea-level. Pop. (1901) town 9586, commune 22,966. It has been noted since the 13th century for its paper mills, which still produce the best paper in Italy. A school of painting arose here, in the early masters of which is Allegrato Nuzzi (1306-1385); and several of the churches contain works by him and other local masters. His pupil, Gentile da Fabriano (1370-1428), is a painter of considerably greater skill and wider knowledge; but there are no important works of his at Fabriano. The sacristy of S. Agostino also contains some good frescoes by Ottaviano Nelli of Gubbio. The municipal picture gallery contains a collection of pictures, and among them are some primitive frescoes, attributable to the 12th century, which still retain traces of Byzantine influence. The Archivio Comunale contains documents on watermarked paper of local manufacture going back to the 14th century. The Ponte dell’Apre, a bridge of the 15th century, is noticeable for the ingenuity and strength of its construction. The hospital of S. Maria Buon Gesù is a fine work of 1456, attributed to Rossellino.

See A. Zonghi, Antiche Carte Fabrianesi.

(T. As.)

FABRICIUS, GAUS LUSCINUS (i.e. “the one-eyed”), Roman general, was the first member of the Fabrian gens who settled in Rome. He migrated to Rome from Aletrum (Livy ix. 43), one of the Hernican towns which was allowed to retain its independence as a reward for not having revolted. In 285 B.C. he was one of the ambassadors sent to the Tarentines to dissuade them from making war on the Romans. In 282 (when consul) he defeated the Bruttians and Lucanians, who had besieged
Thurii (Livy, Epit. 12). After the defeat of the Romans by Pyrrhus at Heraclea (286), Fabricius was sent to treat for the ransom and exchange of the prisoners. All attempts to bribe him were unsuccessful, and Pyrrhus is said to have been so impressed that he released the prisoners without ransom (Pomponius Mela). This and other instances attributed to Pyrrhus attempted to frighten Fabricius by the sight of an elephant in the Roman theatre.

In 278 Fabricius was elected consul for the second time, and was successful in negotiating terms of peace with Pyrrhus, who sailed away to Sicily. Fabricius afterwards gained a series of victories over the Samnites, the Lucanians and the Bruttians, and on his return to Rome received the honour of a triumph. Notwithstanding the offices he had filled he died poor, and provision had to be made for his daughter out of the funds of the state (Val. Max. iv. 4, 10). Fabricius was regarded by the Romans of later times as a model of ancient simplicity and incorruptible integrity.

FABRICIUS, GEORG (1516–1751), German poet, historian and archaeologist, was born at Chemnitz in upper Saxony on the 23rd of April 1516, and educated at Leipzig. Travelling in Italy with one of his pupils, he made an exhaustive study of the antiquities of Rome. He published the results in his Roma (1559), in which the correspondence between every discoverable relic of the old city and the references to them in ancient literature was traced in detail. In 1546 he was appointed rector of the college of Meissen, where he died on the 17th of July 1571. In his sacred poems he attempted to avoid every word with the slightest taint of panegyrical praise; and he blamed the poets for their illusions to pagan divinities.

Principal works: works of Terence (1558) and Virgil (1551); Poetamatur sacrorum libri xxv. (1660); Poliorcarum veterum et novarum usitatorum opera Christiana (1662); De Re Publica libri iii. (1569); Rerum Minorum libri septem (1569); (posthumous) Origines illustriorum stiriis Saxonicae libri septem (1577); Rerum Germaniae magnae et Saxoniae universae memorabilium mirabilius magnae volumina duo (1600). A life of Georg Fabricius was published in 1839 by D. C. W. Baumgarten-Crusius, who in 1845 also issued an edition of Fabricius's Epistolas ad W. Mewertum et aequos aequales, with a short sketch De Vita Ge. Fabricii et de gente Fabriciis; see also F. Wachter in Erard and Grüber's Allgemeine Encyclopädie.

FABRICIUS, HIERONYMUS [Fabricio, Geronomo] (1537-1619), Italian anatomist and embryologist, was named Acquapendente from the episcopal city of that name, where he was born in 1537. At Padua, after a course of philosophy, he studied medicine under G. Fallopius, whose successor as teacher of anatomy and surgery he became in 1562. From the senator of Venice he received numerous honors, and an anatomical theatre was built by them for his accommodation. He died at Venice, 19 May 1618. Among his most important works, the one most important being De humani corporis fabrica (1661). His son received his early education from his father, who on his deathbed recommended him to the care of the theologian, Valentin Alberto. He studied under J. G. Herrichen, and afterwards at Quendlinburg under Samuel Schmid. It was in Schmid's library, as he afterwards said, that he found the two books, F. Barth's Adversaria and D. G. Morhof's Polyhistor Literarius, which suggested to him the idea of his Bibliothecae, the works on which his great reputation was founded. Having returned to Leipzig in 1686, he published anonymously (two years later) his first work, Scriptorum recentiorum decas, an attack on ten writers of the day. His De decem, sic plagiorum et pseudonymorum custodia (1689) is the only one of his works to which he signs the name Faber. He then applied himself to the study of medicine, which, however, he relinquished for that of theology; and having gone to Hamburg in 1603, he proposed to travel abroad, when the unexpected tidings that the expense of his education had absorbed his whole patrimony, and even left him in debt to his trustee, forced him to abandon his project.

He therefore returned at Hamburg in the capacity of librarian to J. F. May. In 1607 he accompanied his patron to Sweden; and after his return to Hamburg, not long afterwards, he became a candidate for the chair of logic and philosophy. The sufferages being equally divided between Fabricius and Sebastian Edzardus, one of his opponents, the appointment was decided by lot in favour of Edzardus; but in 1609 Fabricius succeeded Vincent Plessius in the chair of rhetoric and ethics, a post which he held till his death, refusing invitations to Greifswald, Kiel, Giesen and Wittenberg. He died at Hamburg on the 30th of April 1736.

Fabricius is credited with 128 books, but very few of them were only books which he had edited. One of the most famous laborious of these is the Bibliotheca Latina (1697, republished in an improved and amended form by J. A. Ernesti, 1773). The divisions of the compilation are—the writers to the age of Tiberius; thence to that of the Antonines; and thirdly, to the decay of the language; a fourth gives fragments from old authors, and chapters on early Christian literature. A supplementary work was Bibliotheca Latina medica a Joanne Atelli (1724–1726; supplementary volume by C. Schöttgen, 1746; ed. Manzi, 1754). His chief-de-œuvre, however, is the Bibliotheca Graeca (1709–1728, revised and continued by G. Fabricius, 1790–1809; edition of the 39th century), of which the most important mention is the Fabricius' Antiquaria, an account of the writers whose works illustrated Hebrew, Greek, Roman and Christian antiquities (1713); Centifolium Lutherarum, a Lutheran bibliography (1728); and Bibliotheca Etrusca (1736). His Codex Apocryphi (1716) is still considered indispensable as an authority on apocryphal Christian literature.

The main works of the life of Fabricius are to be found in De Vita et Scriptis J. A. Fabricii Commentarius, by his son-in-law, H. S. Reimarus, the well-known editor of Dio Cassius, published at Hamburg, 1737; see also C. F. Bähr in Erard and Grüber's Allgemeine Encyclopädie, and Lehrs, in the Encyclopädie, vol. iv. 1737.

FABRICIUS, JOHANN CHRISTIAN (1745–1808), Danish entomologist and economist, was born at Tondern in Schleswig on the 7th of January 1745. After studying at Altona and Copenhagen, he was sent to Upsala, where he attended the lectures of Linnaeus. He devoted his attention professionally to political economy, and, after lecturing on that subject in 1769, was appointed in 1775 professor of natural history, economy and finance at Kiel, in which capacity he wrote various works, and was also engaged in the postal service. In 1797 he also published a few other works on general and natural history, botany and travel (including Reise nach Norwegen, 1779), and, although his professional stipend was small, he extended his personal researches into every town in northern and central Europe where a natural history museum was to be found. It is as an entomologist that his memory survives, and for many years his great scientific reputation rested upon the system of classification which he founded upon the structure of the mouth-organs instead of the wings. He had a keen eye for specific differences, and possessed the art of terse and accurate description.

He died on the 3rd of March 1808.

A complete list of his entomological publications (31) will be found in Hagen's Bibliotheca Entomologiana; the following are the chief:—Systema Entomologiae (1775); Genera Insectorum (1776); Philanthropia Entomologica (1778); Species insectorum (1786); Mantissa Insectorum (1787); Entomologia Systematica (1792–1794), with a supplement (1798); Systema Eleutheratorum (1801), Rhygnerorum (1810), Plenatorum (1810), and Antilatorum (1808). Full particulars of his life will be found, with a portrait, in the Transactions of the Entomological Society of London (1845), 4, pp. i–xvi, where his autobiography is translated from the Danish.

FABRIZI, NICOLA (1804–1883), Italian patriot, was born at Modena on the 4th of April 1804. He took part in the Modena insurrection of 1831, and attempted to succour Ancona, but was captured and imprisoned, and released only after a powerful letter from Mazzini to Mattei of Modena. Afterwards he organized with Mazzini the ill-fated Savoy expedition. Taking refuge in Spain, he fought against the Carlists, and was decorated for valour on the battlefield (18th July 1837). At the end of the Carlist War he established a
centre of conspiracy at Malta, endeavoured to dissuade Mazzini from the Bandiera enterprise, but aided Crispi in organizing the Sicilian revolution of 1848. With a company of volunteers he distinguished himself in the defence of Venice, afterwards proceeding to Rome, where he took part in the defence of San Pancrazio. Upon the fall of Rome he returned to Malta, accumulating arms and stores, which he conveyed to Sicily, after having, in 1839, worked with Crispi to prepare the Sicilian revolution of 1848. While Garibaldi was sailing from Genoa towards Marsala, Fabrot found himself at Palermo, and, after severe fighting, joined Garibaldi at Palermo. Under the Garibaldian Dictatorship he was appointed governor of Messina and minister of war. Returning to Malta after the Neapolitan plebiscite, which he had vainly endeavoured to postpone, he was recalled to aid Cialdini in suppressing brigandage. While on his way to Sicily in 1862, to induce Garibaldi to give up the Aspromonte enterprise, he was arrested at Naples by Lamarmora. During the war of 1866 he became Garibaldi's chief of staff, and in 1867 fought at Mentana. In parliament he endeavoured to promote agreement between the chiefs of the Left, and from 1875 onwards worked to secure the return of Garibaldi to power, but died on the 31st of March 1885, two years before the realisation of his object. His whole life was characterized by ardent patriotism and unimpeachable integrity. (H. W. S.)

**FABROT, CHARLES ANNIBAL (1580-1659), French jurist, consult, was born at Aix in Provence on the 17th of September 1580. At an early age he made great progress in the ancient languages and in the civil and the canon law; and in 1602 he received the degree of doctor of law, and was made avocat to the parlement of Aix. In 1609 he obtained a professorship in the university of his native town. He is best known by his translation of the *Basilica*, which may be said to have formed the code of the Eastern empire till its destruction. This work was published at Paris in 1647 in 7 vols. fol., and obtained for its author a considerable pension from the chancellor, Pierre Seguier, to whom it was dedicated. Fabrot likewise rendered great service to the science of jurisprudence by his edition of Cujas, which comprised several treaties of that great jurist previously unpublished. He also edited the works of several Byzantine historians, and was besides the author of various antiquarian and legal works. He died at Paris on the 16th of January 1659.**

**BRYAN, ROBERT (1613-1683), was connected to an Essex family, members of which had been connected with trade in London. He was a member of the Drapers company, alderman of Farringdon Without, and served as sheriff in 1643-1644. In 1646 he was one of those appointed to make representations to the king on the new impositions on English cloth in Flanders. Next year he was one of the aldermen employed in keeping watch at the time of the Cornish rebellion. He resigned his aldermanry in 1652, on the pretext of poverty, apparently in order to avoid the expense of mayorality. He had, however, acquired considerable wealth with his wife Elizabeth Fuke, by whom he had a numerous family. He spent his latter years on his estate of Halsted at Theydon Garnon in Essex. He died on the 28th of February 1653 (Inquisitiones post mortem for London, p. 29, edited by G. S. Fry, 1890); his will, dated the 11th of July 1651, was proved on the 12th of July 1653. Fabyan's Chronicle was first published by Richard Pynson in 1516 as *The new chronicles of England and of France*. In this edition it ends with the reign of Richard III., and this probably represents the work as Fabyan left it, though with the omission of an autobiographical note and some religious verses, which form the *Epistola* of his history. These notes and verses are first found in the second edition, printed by John Rastell in 1533 with continuations down to 1500. A third edition appeared in 1542, and a fourth in 1559 with additions to that year. The only modern edition is that of Sir Henry Ellis, 1811.

In the note above mentioned Fabyan himself says: "and here I make an ende of the vii. parte and hole worke, the vii. day of November in the yere of our Lord Jesu Christes Incarnation M.vic. and iii." This seems conclusive that in 1504 he did not contemplate any extension of his chronicles beyond 1485. The continuations printed by Rastell are certainly not Fabyan's work. But Stow in his *Collections* (ap. *Survey of London*, ii. 305-306, ed. C. L. Kingsford) states that Fabyan wrote "a Chronicle of London, England and of France, beginning at the creation and endyng the third year of Henry VIII., which both I have in written hand." In his *Survey of London* (i. 191, 200, ii. 55, 110) Stow several times quotes Fabyan as his authority for statements which are not to be found in the printed continuations of Rastell. Some further evidence may be found in other notes of Stow's (ap. *Survey of London*, ii. 280, 283, 256, 256), and in the citation by Hakluyt of an unprinted work of Fabyan as the authority for his note of Cabot's voyages. That Fabyan had continued his Chronicle to 1517 may be accepted as certain, but no trace of the manuscript can now be found.

It is only the seventh part of Fabyan's Chronicle, from the Norman Conquest onwards, that possesses any historical value. For his French history he followed chiefly the *Compendium super Francorum gestis* of Robert Gaguin, printed at Paris in 1497. For English history his best source was the old *Chronicles of London*, from which he borrowed also the arrangement of his work in civic form. From 1440 to 1485 he follows, as a rule, with great fidelity, the original of the London Chronicle in Cotton MS. Vitellius A. XVI. (printed in *Chronicles of London*, 1905, pp. 153-264).

Fabyan's own merits are little more than those of an industrious compiler, who strung together the accounts of his different authorities without any critical capacity. He says expressly that his work was "gaderyd without understandyng," and speaks of himself as "of cunynge full destitute." Nevertheless he deserves the praise which he has received as an early worker, and for having made public information which through Hall and Holinshed has become the common property of later historians, and has only recently been otherwise accessible. Bale alleges that the first edition was burnt by order of Cardinal Wolsey because it reflected on the wealth of the clergy; this probably refers to his version of the Lollards Bill of 1410, which Fabyan extracted from one of the London Chronicles.

**FAÇADE, a French architectural term signifying the external face of a building, but more generally applied to the principal front.**

**FACCIOlatI, JACopo (1682-1769), Italian philologist, was born at Torriglia, in the province of Padua, in 1682. He owed his admission to the seminary of Padua to Cardinal Barberigo, who had formed a high opinion of the boy's talents. As professor of logic, and regent of the schools, Facciolati was the orant of the Paduan university during a period of forty-five years. He published improved editions of several philological works, such as the *Thesaurus Ciceronianus* of Nizolius, and the polyglot vocabulary known under the name of Calepino. The latter work, which was assisted by his pupil Egidio Forcellini, he completed in four years—1715 to 1719. It was written in seven languages, and suggested to the editor the idea of his *opus magnum*, the *Tutius Latinitiae Lexion*, which was ultimately published at Cardinal Piole's expense, 4 vols. fol., Padua, 1771 (revised ed. by de Vit, 1858-1887). In the compilation of this work the chief burden seems to have been borne by Facciolati's pupil Forcellini, to whom, however, the lexicographer allows a very scanty measure of justice. Perhaps the best testimony to the learning and industry of the compiler is the well-known observation that the whole body of Latinity, if it were a man, would be dwarfed by this lexicon. Facciolati's mastery of Latin style, as displayed in his epistles, has been very much admired for its purity and grace. In or about 1730 Facciolati undertook the continuation of Papadopoli's history of the university of Padua, carrying it on to his own day. Facciolati was known over all Europe as one of the most enlightened and zealous teachers of the time; and among the many flattering invitations which he received, but always declined, was one from the king of Portugal, to accept the directorship of a college at
Lisbon for the young nobility. He died in 1760. His history of the university was published in 1757, under the name Fasti Gymnasiæ Palæivni. In 1808 a volume containing nine of his Epistles, never before published, was issued at Padua.

See J. E. Sandys, Hist. Class. Soc., ii. 252, for his society, derived either from facere, to make, or from a root fa-, meaning "appear"; cf. Gr. φαίνων, a word whose various meanings of surface, front, expression of countenance, look or appearance, are adaptations of the application of the word to the external part of the front portion of the head, usually taken to extend from the top of the forehead to the point of the chin, and from ear to ear (see Anatomy: Superficial and Artistic; and Physiognomy).

**FACTION** (through the French, from Lat. facie, a company of persons combined for action, facere, to do; from the other French derivative of anything else, "fashion"), a term, used especially with an opprobrious meaning, for a body of partisans who put their party aims and interests above those of the state or public, and employ unscrupulous or questionable means; it is thus a common term of reciprocal abuse between parties. In the history of the Roman and Later Roman empires the factions (factiones) of the circus and hippodrome, at Rome and Constantinople, played a prominent part in politics. The factions were properly the four companies into which the charioteers were divided, and distinguished by the colours they wore. Originally at Rome there were only two, white (albata) and red (russata), whose estates were ceded to two chariots. To four the green (pratina) and blue (veneta) were added. At Constantinople the last two absorbed the red and white factions.

For a brilliant description of the factions at Constantinople under Justinian, and the part they played in the celebrated Nika riot in January 532, see Gibbon's Decline and Fall, ch. x.; and J. B. Bury's Appendix to vol. iv. of his edition (1898), for a discussion of the relationship between the factions and the denes of Constantinople.

**FACTOR** (from Lat. facere, to make or do), strictly "one who makes," thus in ordinary parlance, anything, which goes to the composition of anything else, is termed one of its "factors," and in mathematics the term is used of quantities which, when multiplied together, produce a given product. In a special sense, however—and that to which this article is devoted—"factor" is the name given to a mercantile agent (of the class known as "general agents") employed to buy or sell goods for a commission. When employed to sell, the possession of the goods is entrusted to him by his principal, and when employed to buy it is his duty to obtain possession of the goods and to consign them to his principal. In this he differs from a broker (q.v.), who has no such proprietary interest. Such a factor is distinguished characteristically which gained rise in England to the series of statutes known as the Factors Acts. By these acts, consolidated and extended by the act of 1860, third parties buying or taking pledges from factors are protected as if the factor were in reality owner; but these enactments have in no way affected the contractual relations between the factor and his employer, and it will be convenient to define them before discussing the position of third parties as affected by the act.

I. FACTOR AND PRINCIPAL

A factor is appointed or dismissed in the same way as any other agent. He may be employed for a single transaction or to transact all his principal’s business of a certain class during a limited period or till such time as his authority may be determined. A factor’s duty is to sell or buy as directed; to carry out with care, skill and good faith any instructions he may receive; to receive or make payment; to keep accounts, and to hand over to his principal the balance standing to his principal’s credit, without any deduction save for commission and expenses. All express instructions he must carry out to the full, provided they do not involve fraud or illegality. On any point not covered by his express instructions he must follow the usual practice of his particular business, if not inconsistent with his instructions or his position as factor. Many usages of businesses in which factors are employed have been proved in court, and may now be regarded as legally established. For instance, he may, unless otherwise directed, sell in his own name, give warranties as to goods sold by him, sell by sample (in most businesses), give such credit as is usual in his business, receive payment in cash or as customary, and give receipts in full discharge, secretly indorsement of the bill, and insure the goods. It is his duty to clear the goods at the customs, take charge of them and keep them safely, give such notices to his principal and others as may be required, and if necessary take legal proceedings for the protection of the goods. On the other hand, he has not authority to delegate his employment, or to barter; and as between himself and his principal he has no right to pledge the goods, although as between the principal and the pledgee, an unauthorized pledge made by the factor may by virtue of the Factors Act 1889 be binding upon the principal. It is, moreover, inconsistent with his employment as agent that he should buy or sell any account from or to his principal. A factor has no right to follow any usage which is inconsistent with the ordinary duties and authority of a factor unless his principal has expressly or impliedly given his consent.

On the due performance of his duties the factor is entitled to his commission, which is usually a percentage on the value of the goods sold or bought by him on account of his principal, regulated in amount by the usages of each business. Sometimes the factor makes himself personally responsible for the solvency of the persons with whom he deals, in order that his principal may know the state of affairs; if the factor does not act with due care, the factor is said to be employed on dei credere terms, and is entitled to a higher rate of commission, usually 2½% extra. Such an arrangement is not a contract of guarantee within the Statute of Frauds, and therefore need not be in writing. Besides his remuneration, the factor is entitled to be reimbursed by his principal for any expenses, and to be indemnified against any liabilities which he may have properly incurred in the execution of his principal’s instructions. For the purpose of enforcing his rights a factor has, without legal proceedings, two remedies. Firstly, by virtue of his general lien (q.v.) he may hold any of his principal’s goods which come to his hands as security for the payment to him of any commission, out-of-pocket expenses, or even general balance of account in his favour. Although he cannot sell the goods, he may refuse to give them up until he is paid. Secondly, where he has consigned goods to his principal but not been paid, he may “stop in transit” subject to the same rules of law as an ordinary vendor; that is to say, he must exercise his right before the transit ends; and his right may be defeated by his principal transferring the document of title to the goods to some third person, who takes it in good faith and for valuable consideration (Factors Act 1889, section 10). If the factor does not act with due care, the factor indemifies him out so negligently or unskilfully that his principal gets no benefit thereby, the factor loses his commission and his right to reimbursement and indemnity. If by such failure or negligence the principal suffers any loss, the latter may recover it as damages. So too if the factor fails to render proper accounts his principal may by proper legal proceedings obtain an account and payment of what is found due; and threatened breaches of duty may be summarily stopped by an injunction. Criminal acts by the factor in relation to his principal’s goods are dealt with by section 78 of the Larceny Act 1861.

II. PRINCIPAL AND THIRD PARTY

(a) At Common Law.—The actual authority of a factor is defined by the same limits as his duty, the nature of which has been just described; i.e. firstly, by his principal’s express instructions; secondly, by the rules of law and usages of trade, in view of which those instructions were expressed. But his power to bind his principal as regards third parties is often wider than his actual authority; for it would not be reasonable that third parties should be prejudiced by secret instructions, given in derogation of the authority ordinarily conferred by the custom of trade; and, as regards them, the factor is said to have “apparent” or “ostensible” authority, or to have been having
authority to do what is customary, even though he may in fact have been expressly forbidden so to do by his principal. But this rule is subject to the proviso that if the third party have notice of the factor's actual instructions, the "apparent" authority will not be greater than the actual. The general principle of law," said Lord Blackburn in the case of Cole v. North-Western Bank, 1875, L.R. 10, C.P. 363, "is that when the true owner has clothed any one with apparent authority to act as his agent, he is bound to those who deal with the agent on the assumption that he really is an agent with that authority, to the same extent as if the apparent authority were real." Under certain circumstances the principal is for reasons of common fairness precluded, or, in legal phraseology, estopped, from denying his agent's authority. On the same principle of estoppel, but not by reason of any trade usages, a course of dealing which has been followed between a factor and a third party with the assent of the principal will give the factor apparent authority to continue dealing on the same terms even after the principal's assent has been withdrawn; provided that the third party has no notice of the withdrawal.

Such apparent authority binds the principal both as to acts done by the agent as actual authority and also when the actual authority has entirely ceased. For instance, A.B. receives goods from C. D. with instructions not to sell below 15 per lb; A. B. sells at 10d., the market price; the buyer is entitled to the goods at 10d., because A. B. had apparent authority, although he exceeded his actual authority. On the same principle the buyer would get a good title by buying from A. B. goods entrusted to him by C. D., even though at the time of the sale C. D. had revoked A. B.'s authority and instructed him not to sell at all. In either case the factor is held out as having authority to sell, and the principal cannot afterwards deny the fact and say that his factor had no such authority. As in the course of his business the factor must necessarily make representations preliminary to the contracts into which he enters, so the principal will be bound by any such representations as may be within the factor's actual or apparent authority to the same degree as by the factor's contracts.

(b) Under the Factors Act 1889.—The main object of the Factors Acts, in so far as they relate to transactions carried out by factors, has been to add to the number of cases in which third parties honestly buying or lending money on the security of goods may get a good title from factors in whose possession the goods are. The object of the act is to give protection to the consent, actual or apparent, of the real owners, thus calling in aid the principle of French law that "possession vaunt titre" as against the doctrine of the English common law that "nemo dat quod non habet." The chief change in the law relating specially to factors has been to put pledges by factors on the same footing as sales, so as to bind a principal to third parties by his factor's pledge as by his factor's sale. The Factors Act 1889 in part re-enacts and in part extends the provisions of the earlier acts of 1823, 1825, 1842 and 1877, and is, so far as it relates to sales by factors, in large measure declaratory of the law as it previously existed. Its most important provisions concerning factors are as follows:

Section I., s.s. 1. The expression mercantile agent shall mean a mercantile agent having in the customary course of his business as such agent authority either to sell goods, or to deliver goods for the purpose of sale, or to buy goods, or to raise money on the security of goods;

2. A person shall be deemed to be in possession of goods or of the documents or title to goods when the goods or documents are in his actual custody or are held by any other person subject to his control or for him on his behalf.

4. The expression "document of title" shall include any bill of lading, warehouse receipt, keeper's certificate, and warrant or order for the delivery of goods, and any other document used in the ordinary course of business as proof of the possession or control of goods, or authorizing or purporting to authorize, endorse, transfer, or encumber, the possession of the possessor of the document to transfer or receive goods thereby represented.

Section II., s.s. 1. Where a mercantile agent is, with the consent of the owner, in possession of goods or of the documents or title to goods, any sale, pledge or other disposition of the goods made by him when acting in the ordinary course of business of a mercantile agent shall, subject to the provisions of this act, be as valid as if he were expressly authorized by the owner of the goods to make the same; provided that the person taking under the disposition acts in good faith, and has not at the time of the disposition notice that the person making the disposition has not authority to make the same.

2. Where a mercantile agent has, with the consent of the owner, been in possession of goods or of the documents of title to goods, any sale, pledge or other disposition which would have been valid if the consent had continued shall be valid notwithstanding the determination of the consent, provided that the person taking under the disposition has not at the time thereof notice that the consent has been determined.

3. Where a mercantile agent has obtained possession of any documents of title to goods by reason of his being or having been, with the consent of the owner, in possession of the goods represented thereby, or of any other documents of title to the goods, his possession of the first-mentioned documents shall, for the purposes of the act, be deemed to be with the consent of the owner.

III. ENFORCEMENT OF CONTRACTS

1. Where a factor makes a contract in the name of his principal and himself signs as agent only, he drops out as soon as the contract is made, and the principal and third party alone can sue or be sued upon it. As factors usually contract in their own name this is not a common case. It is characteristic of broken contracts rather than of agencies.

Where a factor makes a contract for the principal without disclosing his principal's name, the third party may, on discovering the principal, elect whether he will treat the factor or his principal as the party to the contract; provided that if the factor contract expressly as factor, so as to exclude the idea that he is personally responsible, he will not be liable. The principal may sue upon the contract, so also may the factor, unless the principal first intervene.

3. Where a factor makes a contract in his own name without disclosing the existence of his principal, the third party may, on discovering the existence of the principal, elect whether he will sue the factor or the principal. Either principal or factor may sue the third party upon the contract. But if the factor has been permitted by the principal to hold himself out as the principal, and the person dealing with the factor has believed that the factor was the principal and has acted on that belief before ascertaining his mistake, then in an action by the principal the third party may set up any defences he would have had against the factor if the factor had brought the action on his own account as principal.

4. Where a factor has a lien upon the goods and their proceeds for advances made to the principal it will be no defence to an action by him for the third party to plead that he has paid the principal, unless the factor by his conduct led the third party to believe that he agreed to a settlement being made with his principal.

5. The factor who acts for a foreign principal will always be personally liable unless it is clear that the third party has agreed to look only to the principal.

6. If a factor contract by deed under seal he alone can sue or be sued upon the contract; but mercantile practice makes contracts by deed uncommon.

FACTORY ACTS, the name given generally to a long series of acts constituting one of the most important chapters in the history of English labour legislation (see LABOUR LEGISLATION); the term "factory" itself being short for manufactory, a building or collection of buildings in which men or women are employed in industry.

FACULA (diminutive of fax, Lat. for "torch"), in astronomy, a minute shining spot on the sun's disk, markedly brighter than the photosphere in general, usually appearing in groups. Faculae are most frequent in the neighbourhood of spots. (See SUN.)

FACULTY (through the French, from the Lat. facultas, ability to do anything, from faciēs, easy, facile, to do; another form of the word in Lat. facultātis, facility, ease, keeps the original meaning), power or capacity of mind or body for particular kinds
of activity, feeling, &c. In the early history of psychology the term was applied to various mental processes considered as causes or conditions of the mind—a treatment of "class concepts of mental phenomena as if they were real forces producing these phenomena (G. F. Stout, Analytic Psychology, vol. I. p. 17). In medieval Latin facultas was used to translate "φυσική" in the Aristotelian application of the word to a branch of learning or knowledge, and thus it is particularly applied to the various departments of knowledge as taught in a university and to the body of teachers of the particular art or science taught. The principal "faculties" in the medieval universities were theology, canon and civil law, medicine and arts (see UNIVERSITIES). A further extension of this use is to the body of members of any particular profession.

In law, "faculty" is a dispensation or licence to do that which is not permitted by the common law. The word in this sense is used only in ecclesiastical law. A faculty may be granted to be ordained deacon under twenty-three years of age; to hold two livings at once (usually called a licence or dispensation, but granted under the seal of the office of faculties; see BENEFICE); to be married at any place or time (usually called a special licence; see MARRIAGE; LICENCE); to act as a notary public (q.v.). Any alteration in a church, such as an addition or diminution in the fabric or the utensils or ornaments of the church, cannot strictly be made without the legal sanction of the ordinary, which can only be expressed by the issuer of a faculty. So a faculty would be required for a vault, for the removal of a body, for the purpose of erecting or altering monuments, for the insertion in the fabric of new bracteates, for brick graves, for the apportionment of a seat, &c. Cathedrals, however, are exempt from the necessity for a faculty before making alterations in the fabric, utensils or ornaments.

The court of faculties is the court of the archbishop for granting faculties. It is a court in which there is no litigation or holding of pleas. Its chief officer is called the master of faculties, and he is one and the same with the judge of the court of arches. Attached to the court of faculties are a registrar and deputy registrars, a chief clerk and record-keeper, and a seal keeper. In Scotland the societys of the archbishops and some of the local bodies of legal practitioners, are described as faculties.

**FAED, THOMAS** (1826–1900), British painter, born in Kirkcudbrightshire, was the brother of John Faed, R.S.A., and received his art education in the school of design, Edinburgh.

He was elected an associate of the Royal Scottish Academy in 1849, came to London three years later, was elected an associate of the Royal Academy in 1861, and academician in 1864, and retired in 1893. He had much success as a painter of domestic genre, and had considerable executive capacity. Three of his pictures, "The Silken Gown," "Faults on Both Sides," and "The Highland Mother," are in the National Gallery of British Art.

See William D. McKay, The Scottish School of Painting (1906).

**FAENZA** (anc. Faentia), a city and episcopal see of Emilia, in Italy, in the province of Ravenna, from which it is 31 m. S.W. by rail, 110 ft. above sea-level. It is 31 m. S.E. of Bologna by rail, on the line from Bologna to Rimini, and it is the junction of a line to Florence through the Appennines. Pop. (1901) 21,809 (town), 30,757 (commune). The town is surrounded by walls which date from 1456. The cathedral of S. Costanzo stands in the spacious Piazza Vittorio Emanuele in the centre of the town. It was begun in 1474 by Giuliano da Maiano; the facade is, however, incomplete. In the interior is the beautiful early Renaissance tomb of S. Savinus with relics showing scenes from his life, of fine and fresh execution, by Benedetto da Maiano; and later tombs by P. Barloto, a local sculptor. Opposite the cathedral is a fountain with bronze ornamentation of 1583–1621. The clock tower alongside the cathedral belongs to the 17th century. Beyond it is the Palazzo Comunale, formerly the residence of the Manfredi, but entirely reconstructed. The other churches of the town have been mostly restored, but S. Michele (and the Palazzo Manfredi opposite it) are fine early Renaissance buildings in brick work. The municipal art gallery contains an altar-piece by Giotomo da Tresivio (who also painted a fresco in the Chiesa della Comenda), a wooden St Jerome by Donatello, and a bust of the young St John by Antonio Rossellino (?), and some fine specimens of majolica, a variety of which, falence, takes its name from the town. It was largely manufactured in the 15th and 16th centuries, and the industry has been revived in modern times with success.

The ancient Faentina, on the Via Amerina, got its name obviously from its name founded by the Romans and had the citizenship for the soon. It was the scene of the defeat of C. Papirius Carbo and C. Norbanus by Q. Caecilius Metellus Pius in 82 B.C. In the census of Vespasian a woman of Faentina is said to have given her age as 135. Pliny speaks of the whiteness of its linen, and the productiveness of its vines is mentioned. It is noticeable that some of the fields in the territory of the ancient Faentina still preserve the exact size of the ancient Roman centuria of 200 iugera (E. Bormann in Corp. Inscr. Lat. xi., Berlin, 1888, p. 121). When the exarchate was established, the town became part of it, and in 748 it was taken by Liutprand. Desiderius gave it to the church with the duchy of Ferrara. In the 11th century it began to increase in importance. In the wars of the 12th and 13th centuries it at first took the imperial side, but in 1240 it stood a long siege from Frederick II. and was only taken after eight months. After further struggles between Guelphs and Ghibellines, the Manfredi made themselves masters of the place early in the 14th century, and remained in power until 1501, when the town was taken by Caesar Borgia and the last legitimate members of the house of the Manfredi were expelled. Rome was restored, and, after falling for a few years into the hands of the Venetians, it became a part of the Serene Republic of Venice in 1509. (T. A.)

FAEROE (also written FAOE or THE FAORES, Danish Faeröerne or Færøerne, "the sheep islands"), a group of islands in the North Sea belonging to Denmark. They are situated between Iceland and the Shetland Islands, about 200 m. N.W. of the latter, and the intersection of 7° E. with 62° N. The total land area of the group is 311 sq. m., and there are twenty-one islands (excluding small rocks and reefs), of which seventeen are inhabited. The population in 1886 amounted to 11,250, and in 1905 to 15,265. The principal island is Streymoy, which is the chief town, Thorshavn, with a population of 1626; Osteró, Süderó, Vágsó, Sandó and Bordó. They consist throughout of rocks and hills, separated from each other by narrow valleys or ravines; but, though the hills rise abruptly, there are often on their summits, or at different stages of their ascent, plains of considerable magnitude. Almost everywhere they present to the sea perpendicular cliffs, broken into fantastic forms, affording at every turn, to those who sail along the coast, the most picturesque and varied scenery. The highest hills are Slitte–tindur in Osteró, and Kopende and Skelljefjord in Stróms, which rise respectively to 2804, 2592 and 2520 ft. The sea pierces the islands in deep fjords, or separates them by narrow inlets through which tidal currents set with great violence, at speeds up to seven or eight knots an hour; and, as communications are maintained almost wholly by boat, the natives have need of expert watermanship. There are several lakes in which trout are abundant, and char also occur; the largest is Sörvaag Lake in Vaagsó, which is close to the sea, and discharges into it by a sheer fall of about 160 ft. Trees are scarce, and there is evidence that they formerly flourished where they cannot do so now.

The fundamental formation is a series of great sheets of columnar basalt, 70 to 100 ft. thick, in which are intercalated thin beds of tuff. Upon this basalt rests an called the coal formation, 35 to 60 ft. thick; the lower part of this is mainly fireclay and sandstone, the upper part is weathered clay with thin layers of brown coal and shale. The coal is found in Süderó and in some of the other islands in sufficient quantity to make it a matter of exploitation. In these beds there are layers of dolerite, 15 to 20 ft. thick, with nodular segregations and abundant cavities which are often lined with pepper. This is the rock from which the islands of the group only the basalt or dolerite are visible. The crater from which the volcanic rocks were outpoured probably lies off the Faeroe Bank some distance to the south-west of Süderó. The basalt is submarine flows which formed the basis of the land.
The climate is oceanic; frosts are common, violent storms are frequent at all seasons. July and August are the only true summer months, but the winters are not very severe. It seldom freezes for more than one month, and the harbours are rarely ice-bound. The methods of agriculture are extremely primitive and less than 3% of the total area is under cultivation. As the plough is ill-suited to the rugged surface of the land, the ground is usually turned up with the spade, care being taken not to destroy the grass, as hay is the principal crop. Horses and cows are few, and the native little milk, in consequence of the coarse hay upon which they are fed. The number of sheep, however, justifies the name of the islands for the individuals having flocks of from three to five hundred, and the total number in the islands considerably exceeds ten thousand. The northern hare (Lepus alpinus) is pretty abundant in Strømø and Osterø, having been introduced into the islands about 1840-1850. The catching of the numerous sea-birds which build their nests upon the faces of the cliffs forms an important source of income to the inhabitants. Sometimes the fowler is led down from the top of the cliff, and when he has climbed the rocks, or, where possible, is pushed upwards by poles made for the purpose. The birds and the contents of the nests are taken in nets mounted on poles; shooting is not practised, lest it should permanently scare the birds away. Fowling has somewhat decreased in modern times, as the fisheries have risen in importance. The puffin is most commonly taken for its feathers. The cod fishery is especially important, dried fish being exported in large quantity, and the swim-bladders made into gelatine, and also used and exported for food. The whaling industry came into importance towards the close of the 19th century, and stations for the extraction of the oil and whalebone have been established at several points, under careful regulations designed to mitigate the pollution of water, the danger to live-stock from eating the blubber, &c. The finner whale is the species most commonly taken.

The trade of the Faeroe Islands was for some time a monopoly in the hands of a mercantile house at Copenhagen, and this monopoly was afterwards assumed by the Danish government, but by the law of the 21st of March 1855 all restrictions were removed on the freedom of the whaling and fishing industries, woollen goods, lamb skins and others, are the chief exports, while in Thorshavn the preserving of fish and the manufacture of carpets are carried on to some extent. Thorshavn is situated on the S.E. side of Strømø, upon a narrow tongue of land, having creeks on each side, where ships may be safely moored. It is the seat of the chief government and ecclesiastical officials, and has a government house and a hospital. The houses are generally built of wood and roofed with birch bark covered with turf. The character of the people is marked by simplicity of manner, kindness and hospitality. They are healthy, and the population increases steadily. The Faeroes form an amt (county) of Denmark. They have also a local parliament (lagting), consisting of the amtmann and nineteen or twenty members. Among other duties, this body elects a representative to the upper house of parliament (landsting) in Denmark; the people choose by vote a representative in the lower house (folketing). The islands are included in the Danish bishopric of Zealand.

History.—The early history of the Faeroes is not clear. It appears that about the beginning of the 9th century Grim Kambø, a Norwegian emigrant who had left his country to escape the tyranny of Harold Haarfager, settled in the islands. It is said that a small colony of Irish and Scottish monks were found in Súðerø and dispersed by him. The Faeroes then already bore their name of Sheep Islands, as these animals had been found to flourish here exceedingly. Early in the 11th century Sigmund or Sigismund Bresterson, whose family had flourished in the southern islands but had been almost exterminated by invaders from the northern, was sent from Norway, whither he had escaped, to take possession of the islands for Olaf Trygvason, king of Norway. He introduced Christianity, and, though he was subsequently murdered, Norwegian supremacy was upheld, and continued till 1386, when the islands were transferred to Denmark. English adventurers gave great trouble to the inhabitants in the 16th century, and the name of Magnus Heineson, a native of Strømø, who was sent by Frederick II. to clear the seas, is still celebrated in many songs and stories. There was for a while a bishopric at Kirkjubø, S. of Thorshavn, where remains of the cathedral may be seen; but it was abolished at the introduction of Protestantism by Christian III. Denmark retained possession of the Faeroes at the peace of Kiel in 1815. The native literature of the islands consists of the Faeroysinga Saga, dealing with the period of Sigmund Bresterson, and a number of popular songs and legends of early origin.

PAPINIR, in Scandinavian mythology, the son of the giant Hreidmar. He was the guardian of the hoard of the Nibelungs and was killed by Sigurd.

FAGGING (from "fag," meaning "weary"; of uncertain etymology), in English public schools, a system under which, generally with the full approval of the authorities, a junior boy performs certain duties for a senior. In detail this custom varies slightly in the different schools, but its purpose—the maintenance of discipline among the boys themselves—is the same. Dr Arnold of Rugby defined fagging as "the power given by the supreme authorities of the school to the Sixth Form, to be exercised by them over the lower boys, for the sake of securing a regular government among the boys themselves, and avoiding the evils of anarchy; in other words, of the lawless treatment of the fags, as a matter of course, daily occurred in the first school at Eton and Winchester in the 16th century, and is probably a good deal older. That the advantages of thus granting the boys a kind of autonomy have stood the test of time is obvious from the fact that in almost all the great public schools founded during the 19th century, fagging has been deliberately adopted by the authorities. The right to fag carries with it certain well-defined duties. The fag-master is the protector of his fags, and responsible for their happiness and good conduct. In cases of bullying or injustice their appeal is to him, not to the form or house master, and, except in the gravest cases, all such cases are dealt with by the fag-master on his own responsibility and without report to the master. Until recent years a fag's duties included such humble tasks as blacking boots, brushing clothes, and cooking breakfasts, and there was no limit to their hours; almost all the fag's spare time being so monopolized. This is now changed. Fagging is now restricted to such light tasks as running errands, bringing tea to the 'master's' study, and fagging at cricket or football. At Eton there is no cricket fagging, and at most schools it is made lighter by all the fags taking their turn in regular order for one hour, so that each boy has to "fag" but once in so many weeks. At Rugby there is "study-fagging,"—two fags being assigned to each Sixth Form boy and made responsible for the sweeping out and tidying up of his study alternately each week—and "night-fagging"—running errands for the Sixth between 8.30 and 9.30 every evening—and each boy can choose whether he will be a study-fag or night-fag. The right to fag is usually restricted to the Sixth Form, but at Eton the privilege is also granted the Fifth, and at Marlborough and elsewhere the Eleven have a right to fag at cricket, whether in the Sixth or not.

FAGGOT, a bundle of sticks used for firewood. The word is adapted from the Fr. fagot, and appears in Italian as fagottco, the gnat, given the last name of the last master. "Fagot" is frequently used with reference to the burning of heretics, and recanted heretics were an embroidered fagot on the arm as a symbol of the punishment they had escaped. In the 18th century the word is used of a "dummy soldier," appearing on the rolls of a regiment. It is this use, coupled with the idea of a bundle of sticks as being capable of subdivision, that appears in the expression "fagot-vote," a vote artificially created by the minute splitting up of property so as to give a bare qualification for the franchise.

FA-HIEN (l. a. D. 399-414), Chinese Buddhist monk, pilgrim-traveller, and writer, author of one of the earliest and most valuable Chinese accounts of India. He started from Changgan or Si-gan-fu, then the capital of the Tsin empire, and passing the Great Wall, crossed the 'River of Sand' or Gobi Desert beyond, that home of "evil demons and hot winds," which he vividly describes,—where the only way-marks were the bones of the dead, where no bird appeared in the air above, no animal on the ground below. Arriving at Khotan, the traveller witnessed a great Buddhist festival; here, as in Yarkand, Afghanistan and other parts thoroughly Islamized before the close of the middle ages, Fa-Hien shows us Buddhism still prevailing. The India he reached was by a perilous descent of "ten thousand cubits" from the "wall-like hills" of the Hindu Kush into the Indus valley (about A. D. 402); and the pilgrim passed the next ten years in the "central" Buddhist realm,—making journeys to Peshawar and Afghanistan (especially the Kabal region) on one side, and to the Ganges valley on another. His special concern was the exploration of the scenes of Buddha's life, the copying of Buddhist texts, and converse with the Buddhist monks and sages whom the Brahmin reaction had not yet driven out. Thus we find him at Buda's birthplace on the Kohana, north-west of Benares; in Patna and on the Vulture Peak near Patna; at the Jetvana monastery in Oudh; as well as at Muttra on the Jumna, at Kanauj, and at Tamulk near the mouth of the Hugli. But now the narrative, which in its earlier portions was primarily historical and geographical, becomes mystical and theological; miracle-stories and meditations upon Buddhist moralities and sacred memories almost entirely replace matters of fact. From the Ganges delta Fa-Hien sailed with a merchant ship, in fourteen days, to Ceylon, where he transcribed all the sacred books, as yet unknown in China. On his return to India he was, however, found; witnessed the festival of the exhibition of Buddha's tooth; and remarked the trade of Arab merchants to the island, two centuries before Mahomet. He returned by sea to the mouth of the Yangtse-Kiang, changing vessels at Java, and narrowly escaping shipwreck or the fate of Jonah.

Fa-Hien's work is valuable evidence to the strength, and in many places to the dominance, of Buddhism in central Asia and in India at the time of the collapse of the Roman empire in western Europe. His tone throughout is that of the devout, learned, sensible, rarely hysterical pilgrim-traveller. His record is careful and accurate, and most of his positions can be identified; his devotion is so strong that it leads him to deprecate China as a "border-land," India the home of Buddha being the true "middle kingdom" of his creed.
See James Legge, Record of Buddhist Kingdoms, being an account by the Hon. Mark Fain of his travels in India and Ceylon, translated and edited, with map, &c. (Oxford, 1886); S. Beal, Travels of Fa-hsien and Sung-Yan, Buddhist pilgrims from China to India, 1600 and 512 A.D., translated, with map, &c. (C. R. Beazley, Dawn of Modern Geography, vol. i, 1897), pp. 479-495.

Fahlcrantz, Christian Erik (1799-1866), Swedish author, was born at Stora Tuna in Sweden on the 30th of August 1799. His brothers, Carl Johan (1774-1861), the landscape-painter, and Axel Magnus (1780-1854), the sculptor, became hardly less distinguished than himself. In 1804 he entered the university of Upsala; in 1821 he became tutor in Arabic, and in 1825 professor of Oriental languages. In 1828 he entered the church, but earlier than this, in 1825, he published his Noachs Ark, a successful satire on the literary and social life of his time, followed in 1826 by a second part. In 1835 Fahlcrantz brought out his work on the young of African animals, which was completed in 1846, in 14 cantos. In 1842 he was made a member of the Swedish Academy, and in 1849 he was made bishop of Vesteras, his next literary work being an archaeological study on the beautiful ancient cathedral of his diocese. In the course of the years 1838-1861 appeared the five volumes of his Rom for och nu (Rome as it was and is), a theological polemic, mainly directed against the Jesuits. He died on the 6th of August 1866. His complete works (7 vols., Örebro, 1863-1866) were issued mainly under his own superintendence.

Fahreheit, Gabriel Daniel (1688-1736), German physicist, was born in Hamburg on the 14th of May 1686. For the most part he lived in England and Holland, devoting himself to the study of physics and making a living, apparently, by the manufacture of meteorological instruments. He was the author of important improvements in the construction of thermometers, and he introduced the thermometric scale known by his name and still extensively used in Great Britain and the United States (see THERMOMETER). He also invented an improved form of hygrometer, a description of which, together with accounts of various observations and experiments made by him, was published in the Phil. Trans. for 1724. He died in Holland on the 16th of September 1736.

Faidherbe, Louis Léon César (1818-1889), French general and colonial administrator, was born on the 3rd of June 1818, at Lille, received his military education at the Ecole Polytechnique and at Metz, and entered the engineers in 1840. From 1844 to 1847 he served in Algeria, then two years in the West Indies, and again in Algeria, taking part in many expeditions against the Arabs. In 1852 he was transferred to Senegal as sub-director of engineers, and in 1854 was promoted chef de bataillon and appointed governor of the colony. He held this post with one brief interval until July 1856. The work he accomplished in West Africa constitutes his most enduring monument. At that time the southern coast of Senegal was less than the town of St Louis and a strip of coast. Explorers had, however, made known the riches and possibilities of the Niger regions, and Faidherbe formed the design of adding those countries to the French dominions. He even dreamed of creating a French African empire stretching from Senegal to the Red Sea. To accomplish even the first part of his design he had very inadequate resources, especially in view of the aggressive action of Omar Al-Hadjj, the Moslem ruler of the countries of the middle Niger. By boldy advancing the French outposts on the upper Senegal Faidherbe stemmed the Moslem advance, and by an advantageous treaty with Omar in 1860 brought the French possessions into touch with the Niger. He also brought into subjection the country lying between the Senegal and Gambia. When he resigned his post French rule had been firmly established over a very considerable and fertile area and the foundation laid upon which his successors built up the predominant position occupied now by France in West Africa. In 1863 he became general of brigade. From 1867 to the early part of 1870 he commanded the subdivision of Bona in Algeria, and was commanding the Constantine division at the commencement of the Franco-German War. Promoted general of division in November 1870, he was on the 3rd of December appointed by the Government of National Defence to be commander-in-chief of the army of the North. In this post he showed himself to be possessed of the highest military talents, and the struggle between the 1. German army and that commanded by Faidherbe, in which were included the hard-fought battles of Pont Noyelles, Bapaume and St Quentin, was perhaps the most important to the French army in the whole of the People's War. Even with the inadequate force of which he disposed he was able to maintain a steady resistance up to the end of the war. Elected to the National Assembly for the department of the Nord, he resigned his seat in consequence of its reactionary proceedings. For his services he was decorated with the grand cross, and made chancellor of the order of the Legion of Honour. In 1872 he went on a scientific mission to Upper Egypt, where he studied the monuments and inscriptions. An enthusiastic geographer, philologist and archaeologist, he wrote numerous works, among which may be mentioned Collection des inscriptions numismatiques (1879), Épigraphie phénicienne (1873), Essai sur la langue poli (1874), and Le Zënaqqa des tribes sénégalaises (1875), the last a study of the Berber language. He also wrote on the geography and history of Senegal and the Sahara, and La Campagne de l'Armée du Nord (1872). He was elected a senator in 1879, and, in spite of failing health, continued to the last a close student of his favourite subjects. He died on the 29th of September 1880, and received a public funeral. Statues and monuments to his memory were erected at Lille, Bapaume, St Quentin and St Louis, Senegal.

Faience, properly the French term for the porcellain de Faenza, a fine kind of glazed and painted earth, imitated from Faenza in Italy, hence a term applied generally to all kinds of pottery other than unglazed pottery or porcelain. It is often particularly applied to the translucent earthenware made in Persia (see CERAMICS).

Fallier, Pierre Louis Charles De (1810-1892), French general, was born at Rozoy-sur-Serre (Aisne) on the 21st of January 1810, and entered the army from St Cyri in 1828. In 1831 he had risen to the rank of colonel, and Napoleon III., with whom he was a favourite, made him general of brigade in 1851 and general of division in 1855, after which for a time he De Fallier was aide-de-camp. In the war of 1859 De Fallier commanded a division, and in 1867 he defeated Garibaldi at Mentana, this action being the first in which the chassepot was used. In 1870 De Fallier commanded the V. corps. His inactivity at Bitsch on the 6th of August while the I. corps on his right and the II. corps on his left were crushed at Wörth and Spicheren respectively, gave rise to the greatest indignation in France, and his military career ended, after the V. corps had been severely handled at Beaumont on the 30th of August, with the catastrophe of Sedan. The rest of his life was spent in retirement. De Fallier wrote Campagne de 1870. Opérations et marches du 5e corps jusqu'au 30 août (Brussels, 1872).

Fain, Agathon Jour Fransois (1778-1837), French historian, was born in Paris on the 11th of January 1778. Having gained admittance to the offices of the Directory, he became head of a department. Under the Consulate he entered the office of the secretary of state, in the department of the archives. In 1806 he was appointed secretary and archivist to the cabinet particulier of the emperor, whom he attended on his campaigns and journeys. He was created a baron of the empire in 1809, and, on the fall of Napoleon, was first secretary of the cabinet and confidential secretary. Compelled by the second Restoration to retire into private life, he devoted his leisure to writing the history of his times, an occupation for which his previous employments well fitted him. He published successively Manuscrit de 1814, contenant l'histoire des six derniers mois du regne de Napoleon (1823; new edition with illustrations, 1866); Manuscrit de 1813, contenant le précis des événements de cette année pour servir à l'histoire de l'empereur Napoleon (1824); Manuscrit de 1812 (1827); and Manuscrit de l'an iii. (1794-1795), contenant les premières transactions de l'Europe avec la république française et le tableau des derniers événements du régime conventionnel (1828), all of which are remarkable for accuracy and wide range of knowledge, and are a very valuable source for the history of

126
FAIR

Napoleon I. Of still greater importance for the history of Napoleon are Fain’s Mémoires, which were published posthumously in 1908; they relate more particularly to the last five years of the empire, and give a detailed picture of the emperor at work on his correspondence among his confidential secretaries. Immediately after the overthrow of Charles X., King Louis Philippe appointed Fain first secretary of his cabinet (August 1830). Fain was a member of the council of state and deputy from Montargis from 1834 until his death, which occurred in Paris on the 16th of September 1837.

PAIR, a commercial institution, defined as a “greater species of market recurring at more distant intervals”: both “fair” and “market” (q.e.) have been distinguished by Lord Coke from “mart,” which he considers as a greater species of fair; and all three may be defined as periodic gatherings of buyers and sellers in an appointed place, subject to special regulation by law or custom. Thus in England from a strictly legal point of view there can be no fair or market without a franchise; and a franchise of fair or market can only be exercised by right of a grant from the crown, or by the authority of parliament or by prescription presupposing a grant. In the earliest times periodical trading in special localities was necessitated by the difficulties of communication and the dangers of travel. Public gatherings, whether religious, military or judicial, which brought together widely scattered populations, were utilized as opportunities for commerce. At the festivals of Delos and at the Olympic games trading took place, and primitive fairs are held in the temple of Voturna served at the same time as a fair and was regularly attended by Roman traders. Instances of a similar nature might be multiplied; but it was above all with religious festivals which recurred with regularity and convened large numbers of persons that fairs, as distinguished from markets, are most intimately associated.

The most commonly accepted derivation of the word “fair” is from the Latin mercatus, a name which the church borrowed from Roman custom and applied to her own festivals. A fair was generally held during the period of a saint’s feast and in the precincts of his church or abbey, but in England this desecration of church or churchyard was first forbidden by the Statute of Winton (c. Edward I). Most of the famous fairs of medieval England and Europe, with their tolls or other revenues, and, within certain limits of time and place, their monopoly of trade, were grants from the sovereign to abbeys, bishops and other ecclesiastical dignitaries. Their “holy day” associations are preserved in the German word for fairs, Messen; as also in the Kirmisse, “church mass,” of the people of Brittany. So very intimate was the connexion between the fair and the feast of the saint that the former has very commonly been regarded as an offshoot or development of the latter. But there is very little reason to suppose that fairs were already existing national institutions, long before the church turned or was privileged to turn them to her own profit.

The first charter of the great fair of Stourbridge, near Cambridge, was granted by King John for the maintenance of a leper hospital; but the origin of the fair itself is ascribed to Carausius, the rebel emperor of Britain, A.D. 207. At all events, it may be seen from the data given in Herbert Spencer’s Descriptive Sociology that the country had then arrived at the stage of development where fairs might have been regarded as a necessity. The Romans also appear to have elaborated a market-law similar to that in force throughout medieval Europe—though it must be observed that the Roman mundusae, which some have regarded as fairs, were weekly markets. It has also been supposed that the ancient fairs of Lyons were a special privilege granted by the Roman conquerors; and Sidonius Apollinaris, A.D. 427, alludes to the fairs of the district afterwards known as the county of Champagne, as if they were then familiarly known institutions. Fairs, in a word, would not only have arisen naturally, wherever the means of communication between individuals or centres of import and consumption were felt to be inadequate to the demand for an interchange of commodities; but, from their very nature, they might be expected to show some essential resemblances, even in points of legislation, and where no international transmission of custom could have been possible. Thus, the fair courts of pre-Spanish Mexico corresponded very closely to those of the Boulanger fair, which resembled the English courts of piepowder. The Spaniards, when first they saw the Mexican fairs, were reminded of the like institutions in Salamanca and Granada. The great fair or market at the city of Mexico is said to have been attended by about 40,000 or 50,000 persons, and is thus described by Prescott:

But notwithstanding the great antiquity of fairs, their charters are comparatively modern—the oldest known being that of St Denys, Paris, which Dagobert, king of the Franks, granted (A.D. 642) to the monks of the place “for the glory of God, and the honour of St Denys at his festival.”

In England it was only after the Norman conquest that fairs became of capital importance. Records exist of 2,800 grants of franchise markets and fairs between the years 1190 and 1483. More than half of these were made during the reigns of John and Henry III., when the power of the church was in ascendency. The first recorded grant was that of the Conqueror to the bishop of Winchester, for leave to hold an annual “free fair” at St Giles’s hill. The monk who had been the king’s jester received his charter of Bartholomew fair, Smithfield, in the year 1133. And in 1248 Henry III. granted a like privilege to the abbots of Westminster, in honour of the “translation” of Edward the Confessor. Sometimes fairs were granted to towns as a means for enabling them to recover from the effects of war and other disasters. Thus, Edward III. granted a “free fair” to the town of Burnley in Rutland, just as, in subsequent times, Charles VII. favoured Bordeaux after the English wars, and Louis XIV. gave fair charters to the towns of Dieppe and Toulon. The importance attached to these old fairs may be understood from the indulgences which, in the 14th century, Charles IV. held out to traders visiting the great fair of Frankfort-on-Main. The charter declared that both during the continuance of the fair, and for eighteen days before and after it, merchants would be exempt from imperial taxation, from arrest for debt, or civil process of any sort, except such as might arise from the transactions of the market itself and within its precincts. Philip of Valois’s regulations for the fair at Tours in 1279 had no doubt been taken as a model of all subsequent fair-legislation of the kingdom, but even of the English and German laws on the subject. The fair had its staff of notaries for the attestation of bargains, its court of justice, its police officers, its sergeants for the execution of the market judges’ decrees, and its visitors—of whom we may mention the prud’hommes,—whose duty it was to examine the quality of goods exposed for sale, and to confiscate those found unfit for consumption. The confiscation required the consent of five or six representatives of the merchant community at the fair. The effect of these great “free fairs” of England and the continent on the development of society was indeed great. They helped to familiarize the western and northern countries with the banking and financial systems of the Lombards and Florentines, who resorted to them under the protection of the sovereign’s “firm peace,” and the ghastly terrors of the pape. They usually became the seat of foreign agencies. In the names of her streets Provins preserved the memory of her 12th-century intercourse with the agents and merchants of Germany and the Low Countries, and long before that time the Syrian traders at St Denys had established their powerful association in Paris. The first recorded grant, however, appears to be that of the commercial side evoked and cherished the international spirit. And during long ages, when commercial “protection” was regarded
as indispensable to a nation's wealth, and the merchant was compelled to "fight his way through a wilderness of taxes," they were the sole and, so far as they went, the complete substitute for the free trade of later days.

Their privileges, however, were from their very nature, destined to grow more oppressive and intolerable the more the towns were multiplied and the means of communication increased. The people of London were compelled to close their shops during the days when the abbots of Westminster's fair was open. But a more curious and complete instance of such an ecclesiastical monopoly was that of the St Giles's fair, at first granted for the customary three days, which were increased by Henry III. to sixteen. The bishop of Winchester was, as we have seen, the lord of this fair. On the eve of St Giles's feast the magistrates of Winchester surrendered the keys of the city gates to the bishop, who then appointed his own mayor, bailiff and coroner, to hold office until the close of the fair. During the same period, Winchester and Southampton also—though it was then a thriving trading town—were forbidden to transact their ordinary commercial business, except within the bishop's fair, or with his special permission. The bishop's officers were posted along the highways, with power to forfeit to his lordship all goods bought and sold within 7 m. of the fair—in whose centre stood "the pavilion," or bishop's court. It is clear, from the curious record of the Establishment and Expenses of the Household of Percy, 5th earl of Northumberland, that fairs were the chief centres of country trade as late as the 16th century. They began to decline rapidly after 1759, when good roads had been constructed and canal communication established between Liverpool and the towns of Yorkshire, Cheshire and Lancashire. In the great towns their extinction was hastened in consequence of their evil effects on public morals. All the London fairs were abolished as public nuisances before 1835—the last year of the ever famous fair of St Bartholomew; and the fairs of Paris were swept away in the storm of the Revolution.

English Fairs and Markets.—For the general reasons apparent from the preceding sketch, fairs in England, as in France and Germany, have very largely given way to markets for specialties. Even the live-stock market of the metropolis is being superseded by the dead-meat market, a change which has been encouraged by modern legislation on cattle disease, the movements of home stock and the importation of foreign animals. Agricultural markets are also disappearing before the "agencies" and the corn exchanges in the principal towns. Still there are some considerable fairs yet remaining. Of the English fairs for live stock, those of Weyhill in Hampshire (October 10), St Faith's, near Norwich (October 17), as also several held at Devizes, Wiltshire, are among the largest in the kingdom. The first named is instituted by a charter of 1260, and is the largest in the country. Weyhill is held annually, with local fair, and is situated on the junction of the Taunton and Wey. It is attended by about 10,000 persons, and uses to be considered fit for the Dublin or Liverpool markets.

French Fairs.—In France fairs and markets are held under the authority of the prefects, new fairs and markets being established by order of the prefects at the instance of the commune interested. Before the Revolution fairs and markets could only be established by seigneurs justiciers, but only two small markets have survived from the revolutionary institution of market rights, namely, the Marché Ste Catherine and the Marché des enfants rouges, both in Paris. Under the present system markets and fairs are held in most of the towns and villages in France; and at all such gatherings exhibitions form an important feature. The great fair of Beaunaire instituted in 1068 has steadily declined since the opening of railway communication, and now ranks with the fairs of ordinary provincial towns. Situated at the junction of the Rhône and the Canal du Midi, and less than 40 m. from the sea, it at one time attracted merchants from Spain, from Switzerland and Germany, and from the Levant and Mediterranean ports, and formed one of the greatest temporary centres of commerce on the continent. One trade firm alone, it is said, rarely did less than 1,000,000 francs worth of business during the fortnight that the fair lasted.

German Fairs.—In Germany the police authorities are considered the market authorities, and to them in most cases is assigned the duty of establishing new fairs and markets, subject to magisterial decision. Russia has three great fairs of Germany are those of Frankfort-on-Main, Frankfort-on-Oder and Leipzig, but, like all the large fairs of Europe, they have declined rapidly in importance. Those of Frankfort-on-Main begin on Easter Tuesday and on the nearest Monday to September 8 respectively, and their legal duration is three weeks, though the limit is regularly extended. The fairs of the second-named city are Reminiscent, February or March; St Margaret, July; St Martin, November. Ordinarily they last fifteen days, which is double the legal term. The greatest of the German fairs are those of Leipzig, whose display of books is famous all over the world. Its three fairs are dated January 1, Easter, Michaelmas. The third is the book fair, which is attended by all the principal booksellers of Germany, and by many more from the adjoining countries. Most German publishers have agents at Leipzig. As many as 2,000 new publications have been entered in a single Leipzig catalogue. As in the other instances given, the Leipzig fairs last for three weeks, or nearly twice their allotted duration. Here no days of grace are allowed, and the holder of a bill must demand payment when due, and protest, if necessary, on the same day, otherwise he cannot proceed against either drawer or endorser.

Inland Fairs.—These fairs are held by local authorities. Landed proprietors may also hold fairs on their estates subject to the sanction of the local authorities; but no private tolls may be levied on commodities brought to such fairs. In Siberia and the east of Russia, where more primitive conditions foster such centres of trade, fairs are still of considerable importance. Throughout Russia generally they are very numerous. The most important, that of Nijni Novgorod, held annually in July and August at the confluence of the rivers Volga and Kama, was instituted in the 17th century by the tsar Michael Fedorovich. In 1881 it was calculated that trade of the value of 1,000,000 rubles was carried on within the limits of the fair. It still continues to be of great commercial importance, and is usually attended by upwards of 100,000 persons from all parts of Asia and eastern Europe. Other fairs of consequence are those of Irbit in Perm, Kharkoff (January and August), Poltava (August and February), Korennaï in Koursk, Ourloupinskia in the Don Cossack country, Krolevetz in Tchernigoff, and a third fair held at Poltava on the feast of the Ascension.

Indian Fairs.—The largest of these, and perhaps the largest in Asia, is that of Hurdi,war, on the upper course of the Ganges. The visitors to this holy fair number from 200,000 to 300,000; but every twelfth year there occurs a special pilgrimage to the sacred river, when the numbers may amount to a million or upwards. Those who go solely for the purposes of trade are Nepalese, Mongolians, Tibetans, central Asians and Mahomedan peddlars from the Punjab, Sind and the border states. Persian shawls and carpets, Indian silks, Kashmir shawls, cottons (Indian and English), preserved fruits, spices, drugs, &c., together with immense numbers of cattle, horses, sheep and camels, are brought to this famous fair.

American Fairs.—The word "fair," as now used in the United States, appears to have completely lost its Old World meaning. It is now exclusively applied to industrial exhibitions and to what in England are called fancy bazaars. Thus, during the Civil War, large sums were collected at the "sanitary fairs."
FAIRBAIRN, A. M.—FAIRBAIRN, W. 129

for the benefit of the sick and wounded. To the first-named class belong the state and county fairs, as they are called. Among the first and best-known of these was the "New York World's Fair," opened in 1853 by a company formed in 1851. (See Exhibit.)

Law of Fairs.—As no market or fair can be held in England without a royal charter, or right of prescription, so any person erecting a market or fair must have a license. This was a writ of Quo warranto, by any one to whose property the said market may be injurious. Nor can a fair or market be legally held beyond the time specified in the grant; and by 5 Edward III. c. 5 (1360), where the seller is adjudged at the legal value, the fair forfeited double their value. To be valid, a sale must take place in "market-over" (open market); and it will not be binding if it carries with it a reservation or condition regulating the sale of the "bona fide" purchaser in market-over who had the goods before conviction. For obvious reasons the rules of market-over were made particularly stringent in the case of horses. Thus, by 2 P. 36 (1665), and 8 Edward III. c. 25 (1356) no horse was legal which had not satisfied the following conditions:

1. Public exposure of the animal for at least an hour between sunrise and sunset.
2. Identification of the vendor by the market officer, or giving personal guarantees of the genuineness of entry of these particulars, together with a description of the animal, and a statement of the price paid for it, in the market officer's book. While in this instance a sale in spite of a reserved claim of the owner would be legal, if the owner could recover, he claimed within six months, produced witnesses, and tendered the price paid to the vendor. Tolls were not a "necessary incident" of a fair—i.e., they were not a legal incident, or recoverable by custom. As a rule, they were paid only by the vendor, and to the market clerk, whose record of the payment was an attestation to the genuineness of the purchase. By 2 & 3 Philip & Mary c. 7 (1684) every person entering a fair or market was bound to exact the toll of the fair or market, and to collect and enter them. It was also this functionary's \(\textit{a priori}\) business to test measures and weights. Tolls, again, are sometimes held to include "stallage" and "pichage," which mean respectively the price for permission to erect stalls and to dig holes in the market ground. But toll proper belongs to the lord of the market, whereas the other two are regarded as the property of the lord of the fair. The law is not quite clear on the employment of the stall to be levied on any house situated in the vicinity of a market, and kept open for business during the legal term of the said market. Among modern statutes, one of the chief is the Markets and Fairs Clauses Act 1884. The law of Fairs on the 18th June 1854, at 1 "stallage" in/on the fair, was called "pichage,"" which person was prohibited from killing or destroying any hawk or other bird of prey anywhere existing in these slaughter-houses. Again, by the Fairs Act 1872, times of holding fairs are determined by the secretary of state; while the Fairs Act 1854 set the time for the opening of the sheep fair, or "show," in the county of the懒得, i.e., "dusty-foot." 1 The lord of the fair or his representative was the presiding judge, and usually he was assisted by a jury of traders chosen on the spot. Their jurisdiction was limited by the legal times and precincts of the fair, and to disputes about contracts, "slander of wares," attestations, the preservation of order, &c.

FAIRBAIRN, ANDREW MARTIN (1838-1904) British Non-conformist divine, was born near Edinburgh on the 8th of November 1838. He was educated at the universities of Edinburgh and Berlin, and at the Evangelical Union Theological Academy in Glasgow. He entered the Congregational ministry and held pastorates at Bathgate, West Lothian and at Aberdeen. From 1857 to 1886 he was principal of Airedale College, Bradford, a post which he gave up to become the first principal of Mansfield College, Oxford. In the transference to Oxford under that name of Spring Hill College, Birmingham, he took a considerable part, and he has exercised influence not only over generations of his own students, but also over a large (member of un-M. G. B. A.; Ev. C.)

FAIRBAIRN, SIR WILLIAM, Bart. (1789-1874), Scottish engineer, was born on the 19th of February 1789 at Kelso, Roxburghshire, where his father was a farm-bailiff. In 1803 he obtained work at three shillings a week as a mason's labourer on the bridge then being built by John Rennie at Kello; but within a few days he was incapacitated by an accident. Later in the same year, his father having been appointed steward on a farm connected with Percy Main Collery near North Shields, he obtained employment as a carter in connexion with the collery. In March 1804 he was bound an apprentice to a millwright at Percy Main, and then found time to supplement the deficiencies of his early education by systematic private study. It was at Percy Main that he made the acquaintance of George Stephenson, then who had charge of an engine at a neighbouring colliery. For a few years after the expiration of his apprenticeship in 1811, he lived a somewhat roving life, seldom remaining long in one place and often reduced to very hard straits before he got employment. But in 1817 he entered into partnership with a shopmate, James Lillie, with whose aid he hired an old shed in High Street, Manchester, where he set up a lathe and began business. The firm quickly secured a good reputation.

1 In Med. Lat. "pudor-pudereus" meant an itinerant merchant or pedlar. In Scotch-Tongue law "marchand-travelland" and "dusty fute" are identical.

5
and the improvements in mill-work and water-wheels introduced by Fairbairn caused its fame to extend beyond Manchester to Scotland and even the continent of Europe. The partnership was dissolved in 1832.

In 1830 Fairbairn had been employed by the Forth and Clyde Canal Company to make experiments with the view of determining whether it was possible to construct steamers capable of traversing the canal at a speed which would compete successfully with that of the railway; and the results of his investigation were published by him in 1831, under the title Remarks on Canal Navigation. The undertaking of using iron boats proved inadequate to overcome the difficulties of this problem, but in the development of the use of this material both in the case of merchant vessels and men-of-war he took a leading part. In this way also he was led to pursue extensive experiments in regard to the strength of iron. In 1835 he established, in connexion with his Manchester business, a shipbuilding yard at Millwall, London, where he constructed several hundred vessels, including many for the royal navy; but he ultimately found that other engagements prevented him from paying adequate attention to the management, and that the end of fourteen years he disposed of the concern to a competitor.

In 1837 he was consulted by the sultan of Turkey in regard to machinery for the government workshops at Constantinople. In 1845 he was employed, in conjunction with Robert Stephenson, in constructing the tubular railway bridges across the Conway and Menai Straits. The share he had in the undertaking has been the subject of some dispute; his own version is contained in a volume he published in 1849, An Account of the Construction of the Britannia and Conway Tubular Bridges. In 1849 he was invited by the king of Prussia to submit designs for the construction of a bridge across the Rhine, but after various negotiations, another design, by a Prussian engineer, which was a modification of Fairbairn's, was adopted. Another matter which engaged much of Fairbairn's attention was steam boilers, in the construction of which he effected many improvements. Amid all the cares of business he found time for varied scientific investigation. In 1851 his fertility and readiness of invention greatly aided an inquiry carried out at his Manchester works by Sir William Thomson (Lord Kelvin) and J. P. Joule, at the instigation of William Humphkins, to determine the melting points of substances under great pressure; and from 1861 to 1865 he was employed to guide the experiments of the government committee appointed to inquire into the "application of iron to defensive purposes." He died at Moor Park, Surrey, on the 18th of August 1874. Fairbairn was a member of many learned societies, both British and foreign, and in 1861 served as president of the British Association. He declined a knighthood in 1861, but accepted a baronetcy in 1869.

His youngest brother, Sir Peter Fairbairn (1799-1861), founded a large machine manufacturing business in Leeds. Starting on a small scale with flax-spinning machinery, he subsequently extended his operations to the manufacture of textile machinery in general, and finally to that of engineering tools. He was knighted in 1838.

See The Life of Sir William Fairbairn, partly written by himself and edited and completed by Dr William Pole (1877).

FAIRBANKS, ERASTUS (1792-1864), American manufacturer, was born in Brimfield, Massachusetts, on the 28th of October 1792. He studied law but abandoned it for mercantile pursuits, finally settling in St. Johnsbury, Vermont, where in 1824 he formed a partnership with his brother Thadeeus for the manufacture of stoves and ploughs. Subsequently the scales invented by Thadeeus were manufactured extensively. Erastus was a member of the state legislature in 1836-1838, and governor of Vermont in 1842-1853 and 1860-1862. During his second term rendering valuable aid in the equipment and despatch of troops in the early days of the Civil War. His son Horace (1820-1888) became president of E. & T. Fairbanks & Co. in 1874, and was governor of Vermont from 1876 to 1878.

His brother, Thadeeus Fairbanks (1796-1858), inventor, was born at Brimfield, Massachusetts, on the 17th of January 1796. He early manifested a genius for mechanics and designed the models from which he and his brother manufactured stoves and ploughs at St. Johnsbury. In 1826 he patented a cast-iron plough which was extensively used. The growing of hemp was an important industry in the vicinity of St. Johnsbury, and in 1831 Fairbanks invented a hemp-dressing machine. By the old contrivances then in use, the weighing of loads of hemp-straw was tedious and difficult, and in 1831 Fairbanks invented his famous compound-lever platform scale, which marked a great advance in the construction of machines for weighing bulky and bulky objects.

He subsequently obtained more than fifty patents for improvements in the different machines and engines used in the manufacture of hemp. His name was introduced into St. Johnsbury when the last being granted on his ninetieth birthday. His firm, eventually known as E. & T. Fairbanks & Co., went into the manufacture of scales of all sizes, in which these inventions were utilized. He, with his brothers, Erastus and Joseph P., founded the St Johnsbury Academy. He died at St Johnsbury on the 11th of April 1886.

The latter's son Henry, born in 1820 at St Johnsbury, Vermont, graduated at Dartmouth College in 1845 and at Andover Theological Seminary in 1857; and was professor of philosophy, mathematics and sciences at Ashfield Seminary, 1845-1855, and of natural history from 1859 to 1868. In the following year he patented a grain-scale and thenceforth devoted himself to the scale manufacturing business of his family. Altogether he obtained more than thirty patents for mechanical devices.

FAIRFAX, EDWARD (c. 1580-1635), English poet, translator of Tasso, was born at Leeds, the second son of Sir Thomas Fairfax of Denton (father of the 1st Baron Fairfax of Cameron). His legitimacy has been called in question, and the date of his birth has not been ascertained. He is said to have been only about twenty years of age when he published his translation and essay on the Gerusalemme Liberata, which would place his birth about the year 1598. He preferred a life of study and retirement to the military service in which his brothers were distinguished. He married a sister of Walter Laycock, chief almanac of the northern counties, and lived on a small estate at Fawston, Yorkshire. There his time was spent in his literary pursuits, and in the education of his children and those of his elder brother, Sir Thomas Fairfax, afterwards baron of Cameron. His translation appeared in 1600—Godfrey of Bullogne, or the Recovery of Jerusalem, done into English heroicall Verse by Edw. Fairfax, Gent., and was dedicated to the queen. It was enthusiastically received. In the same year in which it was published, it was reprinted in England's Parnassus. Edward Phillips, the nephew of Milton, in his Theatrum Poetarum, warmly eulogized the translation. Edmund Waller said he was indebted to it for the harmony of his numbers. It is said that it was King James's favourite English poem, and that Charles I. entertained himself in prison with its pages. Fairfax employed the same number of lines and stanzas as his original, but within the limits of each stanza he allowed himself the greatest liberty. Other translators may give a more literal version, but Fairfax alone seizes upon the poetical and chivalrous character of the poem. He presents, says Mr Courtice, "an idea of the chivalrous past of Europe, as seen through the medium of Catholic orthodoxy and classical humanism." The sweetness and melody of many passages are scarcely excelled even by Spenser. Fairfax made no appeal to the public. He wrote, however, a series of elegies, twelve in number, the fourth of which was published, by permission of the family, in Mrs Cooper's Museum Library (1733). Another of the elegies and a Discourse on Witchcraft, as it was acted in the Family of Mr Edward Fairfax at Fawston in the county of York in 1621, edited from the original copy by Lord Houghton, appeared in the Miscellanies of the Philanthropist. Mr Courtice was a firm believer in witchcraft. He fancied that two of his children had been bewitched, and he had the poor wretches whom he accused brought to trial, but without obtaining a conviction. Fairfax died at Fawston and was buried there on the 27th of January 1635.

FAIRFAX OF CAMERON, PERDINANDO FAIRFAX, 2ND BARON (1584-1648), English parliamentary general, was a son of Thomas Fairfax of Denton (1560-1640), who in 1627 was
created Baron Fairfax of Cameron in the peerage of Scotland. Born on the 20th of March 1584, he obtained his military education in the Netherlands, and was member of parliament for Boroughbridge during the six parliaments which met between 1614 and 1629 and also during the Short Parliament of 1640. In May 1640 he succeeded his father as Baron Fairfax, and as a Scottish peer sat in the English House of Commons as one of the representatives of Yorkshire during the Long Parliament from 1640 until his death; he took the side of the parliament, but held moderate views and desired to maintain the peace. In the first Scottish war Fairfax had commanded a regiment in the king's army; then on the outbreak of the Civil War in 1642 he was made commander of the parliamentary forces in Yorkshire, with Newcastle as his opponent. Hostilities began after the repudiation of a treaty of neutrality entered into by Fairfax with the Royalists. At first he met with no success. He was driven from York, where he was besieging the Royalists, to Selby; then in 1643 to Leeds; and after beating off an attack at that place he was totally defeated on the 30th of June at Adwalton Moor. He escaped to Hull, which he successfully defended against Newcastle from the 2nd of September till the 11th of October, and by means of a brilliant sally caused the siege to be raised. Fairfax was victorious at Selby on the 11th of April 1644, and joining the Scots besieged York, after which he was present at Marston Moor, where he commanded the infantry and was routed. He was subsequently, in July, made governor of York and charged with the further reduction of the county. In October he took St. Neots, and continued his success. During his command in Yorkshire, Fairfax engaged in a paper war with Newcastle, and wrote The Answer of Ferdinando, Lord Fairfax, to a Declaration of William, earl of Newcastle (1642; printed in Rushworth, pt. iii. vol. ii. p. 139); he also published A Letter from ... Lord Fairfax to ... Robert, Earl of Essex (1643), describing the victorious sally at Hull.

FAIRFAX OF CAMERON, THOMAS FAIRFAX, 3rd Baron FAIRFAX (1612-1671), parliamentary general and commander-in-chief during the English Civil War, the eldest son of the 2nd lord, was born at Denton, near Otley, Yorkshire, on the 17th of January, 1612. He was educated at St. Michael's College, Tofts (1626-1629), and then proceeded to Holland to serve as a volunteer with the English army in the Low Countries under Sir Horace (Lord) Vere. This connexion led to one still closer; in the summer of 1637 Fairfax married Anne Vere, the daughter of the general.

The Fairfaxes, father and son, though serving at first under Charles I. (Thomas commanded a troop of horse, and was knighted by the king in 1640), were opposed to the arbitrary prerogative of the crown, and Sir Thomas declared that "his judgment was for the parliament as the king and king don't treat and safest council." When Charles endeavoured to raise a guard for his own person at York, intending it, as the event afterwards proved, to form the nucleus of an army, Fairfax was employed to present a petition to his sovereign, entreat him to hearken to the voice of his parliament, and to discontinue the raising of troops. This was at a great meeting of the freeholders and farmers of Yorkshire convened by the king on Heworth Moor near York. Charles evaded receiving the petition, pressing his horse forward, but Fairfax followed him and placed the petition on the pommel of the saddle. The incident is thought by some to have been the cause of the parting of the actors in the scene. War broke out, Lord Fairfax was appointed general of the Parliamentary forces in the north, and his son, Sir Thomas, was made lieutenant-general of the horse under him. Both father and son distinguished themselves in the campaigns in Yorkshire (see GREAT REBELLION). Sometimes severely defeated, more often successful, and always energetic, prudent and resourceful, they contrived to keep up the struggle until the crisis of 1644, when York was held by the marquess of Newcastle against the combined forces of the English Parliamentarians and the Scots, and Prince Rupert hastened with all available forces to its relief. A gathering of eager national forces within a few square miles of ground naturally led to a battle, and Marston Moor (q.v.) was decisive of the struggle in the north. The younger Fairfax bore himself with the greatest gallantry in the battle, and though severely wounded managed to join Cromwell and the victorious cavalry on the other wing. One of his brothers, Colonel Charles Fairfax, was killed in the action. But the marquess of Newcastle fled the kingdom, and the Royalists abandoned all hope of retrieving their affairs. The city of York was taken, and nearly the whole north submitted to the parliament.

In the south and west of England, however, the Royalist cause was still active. The war had lasted two years, and the nation began to complain of the contributions that were exacted, and the excesses that were committed by the military. Disatisfaction was expressed with the military commanders, and, as a preliminary step to reform, the Self-denying Ordinance was passed. This involved the removal of the earl of Essex from the supreme command and the reduction of the armed forces of the parliament. Sir Thomas Fairfax was selected as the new lord general with Cromwell as his lieutenant-general and cavalry commander, and after a short preliminary campaign the "New Model" justified its existence, and the rebels' new brutal general," as the king called him, his capacity as commander-in-chief in the decisive victory of Naseby (q.v.). The king fled to Wales. Fairfax besieged Leicester, and was successful at Taunton, Bridgewater and Bristol. The whole west was soon reduced.

Fairfax arrived in London on the 12th of November 1645, having proceeded towards the capital he was accompanied by applauding crowds. Complimentary speeches and thanks were presented to him by both houses of parliament, along with a jewel of great value set with diamonds, and a sum of money. The king had returned from Wales and established himself at Oxford, where there was a strong garrison, but, ever vacillating, he withdrew secretly, and proceeded to Newark to throw himself into the arms of the Scots. Oxford capitulated; and by the end of September 1645 Charles had neither army nor garrison in England. In January 1647 he was delivered up by the Scots to the commissioners of parliament. Fairfax met the king at Nottingham, and stood promised him, as he hoped, the House of Commons, and to Holmby, treating him with the utmost consideration in every way. "The general," said Charles, "is a man of honour, and keeps his word which he had pledged to me." With the collapse of the Royalist cause came a confused period of negotiations between the parliament and the king, between the king and the Scots, and between the Presbyterians and the Independents in and out of parliament. In these negotiations the New Model Army soon began to take a most active part. The lord general was placed in the unpleasant position of intermediary between his own officers and parliament. To the grievances, usual in armies of that time, concerning arrears of pay and indemnity for acts committed on duty, there was quickly added the political propaganda of the Independents, and in July the person of the king was seized by Joyce, a subaltern of cavalry—an act which sufficiently demonstrated the hopelessness of controlling the army by its articles of war. It had, in fact, become the most formidable political party in the realm, and pressed straight on to the overthrow of parliament and the punishment of Charles. Fairfax was more at home in the field than at the head of a political committee, and, finding events too strong for him, he decided to resign his commission. The king, however, persuaded to retain it. He thus remained the titular chief of the army party, and with the greater part of its objects
he was in complete, sometimes most active, sympathy. Shortly before the outbreak of the second Civil War, Fairfax succeeded his father in the barony and in the office of governor of Hull. In the field against the English Royalists in 1648 he displayed his former energy and skill, and his operations culminated in the successful siege of Colchester, after the surrender of which place he approved the execution of the Royalist leaders Sir Charles Lucas and Sir George Lisle, holding that these officers had broken their parole. At the same time Cromwell’s great victory of Preston crushed the Scots, and the Independents became practically all-powerful.

This was a novel written during the siege of Colchester, called upon the lord general to settle the kingdom, but the crisis was now at hand. Fairfax was in agreement with Cromwell and the army leaders in demanding the punishment of Charles, and he was still the effective head of the army. He approved, if he did not take an active part in, Pride’s Purge (December 6th, 1648), but on the last and gravest of the questions at issue he set himself in deliberate and open opposition to the policy of the officers. He was placed at the head of the judges who were to try the king, and attended the preliminary sitting of the court. Then, convinced at last of Cromwell’s designs, he resigned his commission. His name had been tendered him in arms or In calling over the court, when the crier pronounced the name of Fairfax, a lady in the gallery called out “that the Lord Fairfax was not there in person, that he would never sit among them, and that they did him wrong to name him as a commissioner.” This was Lady Fairfax, who could not forbear, as White Locke says, to exclaim aloud against the proceedings of the High Court of Justice. His last service as commander-in-chief was the suppression of the Leveller mutiny at Burford in May 1649. He had given his adhesion to the new order of things, and had been reappointed lord general. But he merely administered the affairs of the army, and when in 1651 the Scots had declared for Charles II., and the council of state resolved to send an army to Scotland in order to prevent an invasion of England, Fairfax resigned his commission. Cromwell was appointed his successor, “captain-general and commander-in-chief of all the forces raised or to be raised by authority of parliament within the commonwealth of England.” Fairfax received a pension of £5000 a year, and lived in retirement at his Yorkshire home of Nunappleton till after the death of the Protector. The troubles of the later Commonwealth recalled Lord Fairfax to political activity, and he was one of the few who endeavored to avert the future of the county, when Monk invited him to assist in the operations about to be undertaken against Lambert’s army. In December 1659 he appeared at the head of a body of Yorkshire gentlemen, and such was the influence of Fairfax’s name and reputation that 1200 horse quitted Lambert’s colours and joined him. This was speedily followed by the breaking up of all Lambert’s forces, and that day secured the restoration of the monarchy.

A “free” parliament was called; Fairfax was elected member for Yorkshire, and was put at the head of the commission appointed by the House of Commons to wait upon Charles II. at the Hague and urge his speedy return. Of course the “merry monarch, scandalous and poor,” was glad to obey the summons, and Fairfax provided the horse on which Charles rode at his coronation. The remaining eleven years of the life of Lord Fairfax were spent in retirement at his seat in Yorkshire. He must, like Milton, have been sorely grieved and shocked by the scenes that followed—the brutal indignities offered to the remains of his companions in arms, Cromwell and Ireton, the sacrifice of Sir Harry Vane, the neglect or desecration of all that was great, noble, graceful and true in England, and the flood of immorality which, flowing from Whitehall, sapped the foundations of the national strength and honour. Lord Fairfax died at Nunappleton on the 12th of November 1671, and was buried at Bilborough, near York. As a soldier he was exact and methodical in planning, in the heat of battle “so highly transported that scarce any one durst speak a word to him” (White Locke), chivalrous and punctilious in his dealings with his own men and the enemy. Honour and conscientiousness were equally the characteristics of his private and public character. But his modesty and distrust of his powers made him less effectual as a statesman than as a soldier, and above all he is placed at a disadvantage by being both in war and peace overshadowed by his associate Cromwell.

Lord Fairfax had a taste for literature. He translated some of the Psalms, and wrote poems on solitude, the Christian warfare, the shortness of life, &c. During the last year or two of his life he wrote two Memorials which have been published—one on the northern actions in which he was engaged in 1644–1646, and the other on some events in his tenure of the chief command. At York and at Oxford he endeavoured to save the libraries from pillage, and he endowed the Bodleian with some valuable MSS. His only daughter, Mary Fairfax, was married to George Villiers, the profligate duke of Buckingham of Charles II.’s court. His correspondence, edited by G. W. Johnson, was published in 1848–1849 in four volumes (see note thereon in Dic. Brit. Biog., &c.), and a life of him by Clements R. Markham in 1870. See also S. R. Gardiner, History of the Great Civil War (1893).

His descendant Thomas, 6th baron (1692–1782), inherited from his mother, the heiress of Thomas, 2nd Baron Culpepper, large estates in Virginia, U.S.A., and having sold Denton Hall and his Yorkshire estates he retired there about 1745, dying a bachelor. He was a friend of George Washington, who married his cousin William Fairfax settled in Virginia, and made him his agent, and Bryan (1737–1802), the son of William Fairfax, eventually inherited the title, becoming 8th baron in 1793. His claim was admitted by the House of Lords in 1800. But it was practically dropped by the American family, until, shortly before the coronation of Edward VII., the successor in title was discovered in Albert Kirby Fairfax (b. 1870), a descendant of the 8th baron, who was an American citizen. In November 1908 Albert’s claim to the title as 12th baron was allowed by the House of Lords.

FAIRFAX, a township, Fairfield county, Connecticut, U.S.A., near Long Island Sound, adjoining Bridgeport on the E. and Westport on the W. Pop. (1890) 3686; (1900) 4489 (1041 being foreign-born); (1910) 6134. It is served by the New York, New Haven & Hartford railway. The principal villages of the township are Fairfield, Southport, Greenfield Hill and Stratfield. The beautiful scenery and fine sea air attract to the township a considerable number of summer visitors. The township has the well-equipped Pequot and Fairfield memorial libraries (the former in the village of Southport, the latter in the village of Fairfield), the Fairfield fresh air hospitals (for between 200 to 300 homes), the Pequot Indians (an even larger number of New York during each summer season), and the Gould home for self-supporting women. The Fairfield Historical Society has a museum of antiquities and a collection of genealogical and historical works. Among Fairfield’s manufactures are chemicals, wire and rubber goods. Truck-gardening is an important industry of the township. In the Pequot Swamp within the present Fairfield a force of Pequot Indians was badly defeated in 1637 by some whites, among whom was Roger Ludlow, who, attracted by the country, founded the settlement in 1639 and gave it its present name in 1645. Within its original limits were included what are now the townships of Redding (separated, 1767), Weston (1787) and Easton (formed from part of Weston in 1845), and parts of the present Westport and Bridgeport. During the colonial period Fairfield was a place of considerable importance, but subsequently it was greatly outstripped by Bridgeport, to which, in 1870, a portion of it was annexed. On the 8th of July 1779 Fairfield was burned by the British and Hessians under Governor William Tryon. Among the prominent men who have lived in Fairfield are Roger Sherman, the first President Dwight of Yale (who described Fairfield in his Travels and in his poem Greenfield Hill), Chancellor James Kent, and Joseph Elyce Sheffield.

neggos; (1905) 5000; (1910) 4070. Area, about 2 and a half sq. m. Fairfield is served by the Chicago, Burlington & Quincy, and the Chicago, Rock Island & Pacific railways. The city is in a blue grass country, in which much live stock is bred; and it is an important market for draft horses. It is the seat of Parsons College (Presbyterian, co-educational, 1873), endowed by Lewis Baldwin Parsons, Sr. (1798-1853), a merchant of Buffalo, N.Y. The college offers classical, philosophical and scientific courses, and has a school of music and an academic department; in 1907-1908 it had 10 instructors and 257 students, of whom 93 were in the college and 97 were in the school of music. Fairfield has a Carnegie library (1892), and a museum with a collection of laces. Immediately E. of the city is an attractive Chautauqua Park, of 30 acres, with an auditorium capable of seating about 4000 persons; and there are many Chautauqua assemblies. The principal manufactory of Fairfield are farm wagons, farming implements, drain-tile, malleable iron, cotton gloves and mittens and cotton garments. The municipality owns its waterworks and an electric-lighting plant. Fairfield was settled in 1839; was incorporated as a town in 1847, and was first chartered as a city in the same year.

See Charles H. Fletcher, Jefferson County, Iowa: Centennial History, Fairfield.

FAIRHAVEN, a township in Bristol county, Massachusetts, U.S.A., on New Bedford Harbor, opposite New Bedford. Pop. (1890) 2910; (1900) 3579 (590 being foreign-born); (1905, state census) 4235; (1910) 5122. Area, about 13 sq. m. Fairhaven is served by the New York, New Haven & Hartford railroad and by electric railway to Mattapoisett and Marion, and is connected with New Bedford by two bridges, by electric railway, and by the New York, New Haven & Hartford ferry line. The principal village is Fairhaven; others are Oxford, Naskatucket and Sconticut Neck. As a summer resort Fairhaven is widely known. Among the principal buildings are the following, presented to the township by Henry H. Rogers (1845-1900), a native of Fairhaven and a large stockholder and long vice-president of the Standard Oil Co.; the town hall, a memorial of Mrs Rogers, the Rogers public schools; the Millicent public library (17,500 vols. in 1908), a memorial to his daughter; and a fine granite memorial church (Unitarian) with parish house, a memorial to his mother; and there is also a public park, of 13 acres, the gift of Mr Rogers. From 1853 to 1857 the inhabitants of Fairhaven were chiefly engaged in whaling, and the fishing interests are still important. Among manufactured works are oars, iron goods, loom-cranks, glass, yachts and boats, and shoes.

Fairhaven, originally a part of New Bedford, was incorporated as a separate township in 1812. On the 4th of September 1778 a fleet and armed force under Earl Grey, sent to punish New Bedford and what is now Fairhaven for their activity in privateering, burned the shipping and destroyed much of New Bedford. The troops then marched to the head of the Acushnet river, and down the east bank to Sconticut Neck, where they camped till the 7th of September, when they re-embarked, having meanwhile dismantled a small fort, built during the early days of the war, on the east side of the river at the entrance to the harbour. On the evening of the 8th of September a landing force from the fleet, which had begun to set fire to Fairhaven, was driven off by a body of about 150 minute-men commanded by Major Israel Fearing; and on the following day the fleet departed. The fort was at once rebuilt and was named Fort Fearing, but as early as 1784 it had become known as Fort Phoenix; it was one of the strongest defences on the New England coast during the war of 1812. The township of Acushnet was formed from the northern part of Fairhaven in 1860.

See James L. Cushing, and others, A Brief History of the Town of Fairhaven, Massachusetts (Fairhaven, 1903).

FAIRHOLT, FREDERICK WILLIAM (1814-1866), English antiquary and wood engraver, was born in London in 1814. His father, who was of a German family (the name was originally Farholz), was a tobacco manufacturer, and for some years Fairholz himself was employed in the business. For a time he was a drawing master, afterwards a scene-painter, and in 1835 he became assistant to S. Sly, the wood engraver. Some pen and ink copies made by him of figures from Hogarth's plates led to his being employed by Charles Knight on several of his illustrated publications. His first published literary work was a contribution to Hone's Year-Book in 1831. His life was one of almost uninterrupted quiet labour, carried on until within a few days of death. Several works on civic pageantry and some collections of ancient unpublished songs and dialogues were edited by him for the Percy Society in 1842. In 1845 he was elected fellow of the Society of Antiquaries. He published an edition of the dramatic works of Lyly in 1836. His principal independent works are Tobacco, Its History and Association (1859); Gog and Magog (1866); Up the Nile and Home Again (1862); many articles and serials contributed to the Art Journal, some of which were afterwards separately published, as Costume in England (1840); Dictionary of Terms in Art (1851); these works are illustrated by numerous cuts, drawn on the wood by his own hand. His pencil was also employed in illustrating Evans's Coins of the Ancient Britons, Madden's Jewish Coinage, Halliwell's folio Shakespeare and his Sir John Maunder, Roach Smith's Richborough, the Miscellanea Graphica of Lord Londesborough, and many other works. He died on the 3rd of April 1866. His books relating to Shakespeare were bequeathed to the library at Stratford-on-Avon; those on civic pageantry (between 200 and 300 volumes) to the Society of Antiquaries; his old prints and works on costume to the British Museum; his general library bequeathed to the Library Fund.

FAIRMONT, a city and the county-seat of Marion county, West Virginia, U.S.A., on both sides of the Monongahela river, about 75 m. S.E. of Wheeling. Pop. (1890) 1023; (1900) 5655, of whom 283 were negroes and 182 foreign-born; (1910) 7911. It is served by the Baltimore & Ohio railroad. Among its manufactures are glass, machinery, flour and furniture, and it is an important shipping point for coal mined in the vicinity. The city is the seat of one of the West Virginia state normal schools. Fairmont was laid out as Morgantown in 1819, but that city was newly established and Marion county in 1842, received its present name about 1844, and was chartered as a city in 1859.

FAIR OAKS, a station on a branch of the Southern railway, 6 m. E. of Richmond, Virginia, U.S.A. It is noted as the site of one of the battles of the Civil War, fought on the 31st of May and the 1st of June 1862, between the Union (Army of the Potomac) under General G. B. McClellan and the Confederate forces (Army of Northern Virginia) commanded by General J. E. Johnston. The attack of the Confederates was made at a moment when the river Chickahominy divided the Federal army into two unequal parts, and was, moreover, swollen to such a degree as to endanger the bridge. General Johnston stationed part of his troops along the river to prevent the Federals sending aid to the smaller force south of it, upon which the Confederate attack, commanded by General Longstreet, was directed. Many accidents, due to the inexperience of the staff officers and to the difficulty of the ground, hindered the development of Longstreet's attack, but the Federals were gradually driven back with a loss of ten guns, though at the last moment reinforcements managed to cross the river and re-establish the line of defence. At the close of the day Johnston was severely wounded, and General G. W. Smith succeeded to the command. The battle was renewed on the 1st of June but not fought out. At the close of the action General R. E. Lee took over the command of the Confederates, which he held till the final surrender in April 1865. So far as the victory lay with either side, it was with the Union army, for the Confederates failed to achieve their purpose of destroying the almost isolated left wing of McClellan's army, and after the battle they withdrew into the lines of Richmond. The Union losses were 5031 in killed, wounded and missing; those of the Confederates were 6134. The battle is sometimes known as the battle of Seven Pines.

FAIRUZABADI (Abu'l-Tahir ibn Ibrahim Majd ud-Din al-Farabi) (1320-1384), Arabian lexicographer, was born at Kazarin near Shiraz. His student days were spent in Shiraz, Wabist, Bagdad and Damascus. He taught for ten years in
FAIRY

Jerusalem, and afterwards travelled in western Asia and Egypt. In 1368 he settled in Mecca, where he remained for fifteen years. He next visited India and spent some time in Delhi, then remained in Mecca another ten years. The following three years were spent in Bagdad, in Shiraz (where he was received by Timur), and in Ta’iz. In 1395 he was appointed chief cadi (qadi) of Yemen, married a daughter of the sultan, and died at Zabid in 1414. During this last period of his life he converted his house at Mecca into a school of Malikite law and established three teachers in it. He wrote a huge lexicographical work of 60 or 100 volumes uniting the dictionaries of Ibn Sida, a Spaniard (d. 1066), and of Ta’si (d. 1252). A digest of or an extract from this last work is his famous dictionary al-Qamus (“the Ocean”), which has been published in Egypt, Constantinople and India, has been translated into Turkish and Persian, and has itself been the basis of several later dictionaries. (G. W. T.)

FAIRY (Fr. fée, faerie; Prov. fada; Sp. hada; It. fatà; med. Lat. fatore, to enchant, from Lat. fætum, fate, destiny), the common term for a supposed race of supernatural beings who magically intermeddle in human affairs. Of all the minor creatures of myth and fairy; the fairies are most numerous, the most memorable in literature. Like all organic growths, whether of nature or of the fancy, they are not the immediate product of one country or of one time; they have a pedigree, and the question of their ancestry and affiliation is one of wide bearing. But mixture and connexion of races have in this as in many other cases so changed the original folk-product that it is difficult to disengage and separate the different strains that have gone to the making or moulding of the result as we have it.

It is not in literature, however ancient, that we must look for the early forms of the fairy belief. Many of Homer’s heroes have fairy lemans, called nymphs, fairies taken up into a higher region of poetry and religion; and the fairy leman is notable in the story of Athamas and his cloud bride Nephele, but this character is as familiar to the unpoetical Eskimo, and to the Red Indians, with their bird-bride and beaver-bride (see A. Lang’s Custom and Myth, “The Story of Cupid and Psyche”). The Gandharvas of Sanskrit poetry are also fairies.

One of the most interesting facts about fairies is the wide distribution and long persistence of the belief in them. They are mentioned in some form in nearly all human civilization. In them dwell in the “raths,” old earth-forts, or earthen bases of later palisaded dwellings of the Norman period, and in the subterranean houses, common also in Scotland. They are an organized people, often called “the army,” and their life corresponds to human life in all particulars. They carry off children, leaving changeling substitutes, transport men and women into fairyland, and are generally the causes of all mysterious phenomena. Whirls of dust are caused by the fairy marching army, as by the being called Kutch in the Dieri tribe of Australia. In 1907, in northern Ireland, a farmer’s house was troubled with flying stones (see Poltergeist). The neighbours said that the fairies caused the phenomenon, as the man had swept his chimney with a bough of holly, and the holly is “a gentle tree,” dear to the fairies. The fairy changeling belief also exists in some districts of Argyll, and a fairy boy dwelt long in a small farm-house in Glencoe, now unoccupied.

In Ireland and the west Highlands neolithic arrow-heads and flint chips are still fairy weapons. They are dipped in water, which is given to ailing cattle and human beings as a sovereign remedy for diseases. The writer knows of “a little lassie in green” who is a fairy and, according to the petrifications, haunts the banks of the Mukomar pool on the Lochy. In Glencoe is a fairy hill where the fairy music, vocal and instrumental, is heard in still weather. In the Highlands, however, there is much more interest in second sight than in fairies, while in Ireland the reverse is the case. The best book on Celtic fairy lore is still that of the minister of Aberfoyle, the Rev. Mr Kirk (ob. 1692). His work on The Secret Commonwealth of Elves, Fauns and Fairies, left in MS. and incomplete (the remainder is in the Laing MSS, Edinburgh University library), was published (a hundred copies) in 1615 by Sir Walter Scott, and in the Bibliothèque de Carabas (Lang) there is a French translation. Mr Kirk is said (though his tomb exists) to have been carried away by fairies. He appeared to a friend and said that he would come again, when the friend must throw a dirk over his shoulder and he would return to this world. The friend, however, lost his nerve and did not throw the dirk. In the same way a woman appeared to her husband in Glencoe in the last generation, but he was wooing another lass and did not make any effort to receive her. She was therefore lost in the glen.

It is clear that in many respects fairyland corresponds to the pre-Christian abode of the dead. Like Persephone when carried to Hades, or Wainamoinen in the Hades of the Finns (Manala), a living human being must not eat in fairyland; if he does, he dwells there for ever. Tamlane in the ballad, however, was “fat and fair of flesh,” yet was rescued by Janet: probably she had not abstained from fairy food. He was to be given as the kane to Hell, which shows a distinction between the beliefs in hell and in the place of fairies.

It is a not uncommon belief that the fairies survive in legend from the neolithic period; that is a remnant of a pigmy people dwelling in the subterranean earth-houses, but the contents of these do not indicate an age prior to the close of the Roman occupation of Britain; nor are pigmy bones common in neolithic sepulchres. The “people of peace” (Daoine Shíe) of Ireland and Scotland are usually of ordinary stature, indeed not to be recognized as varying from mankind except by their proceedings (see J. Curtin, Irish Folk-tales).

The belief in a species of lady fairies, deadly to their human lovers, was found by R. L. Stevenson to be as common in Samoa (see Akahai Nights’ Entertainments) as in Strathbainns or on the banks of Loch Awe. In New Caledonia a native friend of J. J. Atkinson (author of Primal Law) told him that he had met and caressed the girl of his heart in the forest, that she had vanished and must have been a fairy. He therefore would die in three days, which (Mr Atkinson informs the writer) he punctually did. The Greek sirens of Homer are clearly a form of these deadly fairies, as the Nereids and Oreads and Nymphs are fairies of wells, mountains, and the sea. The fairy women who come to the births of children and foretell their fortunes (Fata, Moerae, ancient Egyptian Hathors, Fées, Dominae Folatæ), with their weapons, are refractions of the human “sae-women” (in the Scots term) who attend at birth and derive omens of the child’s future from various signs. The custom is common among several savage races, and these women, represented in the spiritual world by Fata, bequeath to us the French fée, in the sense of fairy. Perrault also uses fée for anything that has magical quality; “the key was fée,” had mona, or wakan, savage words for the supposed “power,” or ether, which works magic or is the vehicle of magical influences.

Though the fairy belief is universally human, the nearest analogy to the shape which it takes in Scotland and Ireland—the “pixies” of south-western England—is to be found in Jān or Jinnīs of the Arabs, Moors and people of Palestine. In stories which have passed through a literary medium, like The Arabian Nights, the genii or Jān do not so much resemble our fairies as they do in the popular superstitions of the East, orally collected. The Jān are now a subterranean commonwealth, now they reside in ruinous places, like the fairies in the Irish rites. Like the fairies they go about in whirls of dust, or the dust-whirls themselves are Jān. They carry off men and women to their own realm, in the phrase of Mr Kirk, and are kind to mortals who are kind to them. They chiefly differ from our fairies in their greater tendency to wear animal forms; though, like the fairies, when they choose to appear in human shape they are not to be distinguished from men and women of mortal mould. Like the fairies everywhere they have amours with mortals, such as that of the Queen of Faery with Thomas of Ercildoune. The herb rue is potent against them, as in British folk-lore, and a man long captivated among the Jān escaped from them by observing their avoidance of rue, and by plucking two handfuls
thereof. They, like the British browmies (a kind of domesticated fairy), are the causes of strange disappearances of things. To preserve houses from their influences, rue, that “herb of grace,” is kept in the apartments, and the name of Allah is constantly invoked. If this is omitted, things are stolen by the Jän.

They often bear animal names, and it is dangerous to call a cat or dog without pointing at the animal, for a Jinni of the same name may be present and may take advantage of the invocation. A man, in fun, called to a goat to escort his wife on a walk: he did not point at the goat, and the wife disappeared. A Jinni had carried her off, and her husband had to seek her at the court of the Jän. Euphemistically they are addressed as mushtarakin, “blessed ones,” as we say “the good folk” or “the people of peace.” As our fairies give gold which changes into withered leaves, the Jän give onion peels which turn into gold. Like our fairies the Jän can apply an ointment, kohi, to human eyes, after which the person so favoured can see Jän, or fairies, which are invisible to other mortals, and can see treasure wherever it may be concealed (see Folk-lore of the Holy Land, by J. E. Hanauer, 1907).

It is pleasant that fairies and Jän are practically identical, a curious proof of the uniformity of the working of imagination in peoples widely separated in race and religion. Fairies naturally won their way into the poetry of the middle ages. They take lovers from among men, and are often described as of delicate, unearthly, ravishing beauty. The enjoyment of their charms is, however, generally qualified by some restriction or compact, the breaking of which is the cause of calamity to the lover and all his race, as in the notable tale of Melusine. This fay by enchantment built the castle of Lusignan for her husband. It was her nature to take sail every week the form of a serpent from the waist below. The hebdemal transformation being once, contrary to compact, witnessed by her husband, she left him with much wailing, and was said to return and give warning by her appearance and great shrieks whenever one of the race of Lusignan was about to die. At the birth of Ogie le Danois six fairies attend, five of whom give good gifts, which the sixth overrides with a restriction. Gervaise of Tilbury, writing early in the 13th century, has in his Oïda Imperialia a chapter, De lamis et nocturnis laris, where he gives it out, as proved by individuals beyond all exception, that men have been lovers of beings of this kind whom they call Fadrons, and who did great mischief. As far as the fairies seem to inflict terrible punishment—the loss of goods and even of life. There seems little in the characteristics of these fairies of romance to distinguish them from human beings, except their supernatural knowledge and power. They are not often represented as diminutive in stature, and seem to be subject to such human passions as love, jealousy, envy and revenge. To this class belong the fairies of Boiardo, Ariosto and Spenser.

There is no good modern book on the fairy belief in general. Keightley’s Fairy Mythology is full of interesting matter; Fyfe’s Celtic Mythology is especially copious about Welsh fairies, which are practically identical with those of Ireland and Scotland. The works of Mr Jeremiah Curtin and Dr Douglas Hyde are useful for Ireland; for Scotland, Kirk’s Secret Companions has already been quoted. Scott’s dissertation on fairies in The Border Minstrelsy is rich in lore, though necessarily Scott had not the wide field of comparative study opened by more recent researches. Full examination of the fairy tradition in the evidence of Jeanne d’Arc at her trial (1431) in Quicheret’s Procés de Jeanne d’Arc, vol. i. pp. 67, 68, 187, 209, 212, vol. ii. pp. 390, 404, 450. (A. L.)

FAIRY RING, the popular name for the circular patches of a dark green colour that are to be seen occasionally on permanent grass-land, either lawn or meadow, on which the fairies were supposed to hold their midnight revels. They mark the area of growth of some fungus, starting from a centre of other mycelium- plants. The mycelium proceeds from the spores dropped by the fungus or from the "spawn" in the soil, radiates outwards, and each year’s successive crop of fungi rises from the new growth round the circle. The rich colour of the grass is due to the fertilizing quality of the decaying fungi, which are peculiarly rich in nitrogenous substances. The most complete and symmetrical grass rings are formed by Marasmius oreades, the fairy ring champignon, but the mushroom and many other species occasionally form rings, both on grass-lands and in woods. Observations were made on a ring in a pine-wood for a period of nine years, and it was calculated that it increased from centre to circumference about 8¾ in. each year. The fungus was never found growing within the circle during the time the ring was under observation, the decaying vegetation necessary for its growth having become exhausted.

FAITHFUL, EMILY (1837-1885), English philanthropist, was the youngest daughter of the Rev. Ferdinand Faithfull, and was born at Headley Rectory, Surrey, in 1835. She took a great interest in the conditions of working-women, and with the object of extending their sphere of labour, which was then painfully limited, in 1860 she set up in London a printing establishment for women. The "Victoria Press," as it was called, soon obtained quite a reputation for its excellent work, and Miss Faithfull was shortly afterwards appointed printer and publisher in ordinary to Queen Victoria. In 1863 she began the publication of a monthly organ, The Victoria Magazine, in which for eighteen years she continuously and earnestly advocated the claims of women to remunerative employment. In 1868 she published a novel, Change upon Change. She also appeared as a lecturer, and with the object of furthering the interests of her sex, lectured widely and successfully both in England and the United States, which latter she visited in 1872 and 1882. In 1888 she was awarded a civil list pension of £50. She died in Manchester on the 31st of May 1895.

FAITH HEALING, a form of “mind cure,” characterized by the doctrine that while pain and disease really exist, they may be neutralized and dispelled by faith in Divine power; the doctrine known as Christian Science (p. e.) holds, however, that pain is only an illusion and seeks to cure the patient by instilling into him this belief. In the Christian Church the tradition of faith healing dates from the earliest days of Christianity; upon the miracles of the New Testament follow cases of healing, first by the Apostles, then by their successors; but faith healing proper is gradually, from the 3rd century onwards, transformed into trust in relics, though faith cures still occur sporadically in later times. Catherine of Siena is said to have saved Father Matthew from dying of the plague, but in this case it is rather the healer who was strong in faith. With the Reformations faith healing proper reappears among the Moravians and Waldenses, who, like the Peculiar People of other sects, kept their trust in prayer and anointing with oil. In the 16th century we find faith cures recorded of Luther and other reformers, in the next century of the Baptists, Quakers and other Puritan sects, and in the 18th century the faith healing of the Methodists in this country was paralleled by Pietism in Germany, which drew into its ranks so distinguished a man of science as Stahl (1660-1734). In the 19th century Prince Hohenlohe-Waldenburg-Schillingsfürst, canon of Grosswardein, was a famous healer on the continent; the Mormons and Irvingites were prominent among English-speaking peoples; in the last quarter of the 19th century faith healing became popular in London, and Bethel homes were opened in 1881, and since then it has found many adherents in England.

Under faith healing in a wider sense may be included (1) the cures in the temples of Aesculapius and other deities in the ancient world; (2) the practice of touching for the king’s evil, in vogue from the 11th to the 18th century; (3) the cures of Valentine Greatrakes, the “Stroker” (1629-1683); and (4) the miracles of Lourdes, and other resorts of pilgrims, among which may be mentioned St Winifred’s Well in Flintshire, Treves with its Holy Coat, the grave of the Jansenist F. de Paris in the 5th century, the little town of Kevlar from 1641 onwards, the tombs of St Louis, Francis of Assisi, Catherine of Siena and others.

An animistic theory of disease was held by Pastor J. Ch. Blumhardt, Dorothea Trudel, Boltzius and other European faith healers. Used in this sense faith healing is indistinguishable from much of savage leech-craft, which seeks to cure disease by expelling the evil spirit in some portion of the body. Although
Fāithorņe, William (1625 or 1627–1691), English painter and engraver, was born in London and was apprenticed to Robert Peake, a painter and printseller, who received the honour of knighthood from Charles I. On the outbreak of the Civil War he accompanied his master into the king’s service, and being made prisoner at Basinghouse, he was confined for some time to Aldersgate, where, however, he was permitted to follow his profession of engraver, and among other portraits did a small one of the first Villiers, duke of Buckingham. At the earnest solicitation of the Duke he very soon regained his liberty, but only on condition of retiring to France. There he was so fortunate as to receive instruction from Robert Nanteuil. He was permitted to return to England about 1650, and took up a shop near Temple Bar, where, besides his work as an engraver, he carried on a large business as a printseller. In 1680 he gave up his shop and retired to a house in Blackfriars, occupying himself chiefly in painting portraits from the life in crayons, although still occasionally engaged in engraving. It is said that his life was shortened by the misfortunes, dissipation, and early death of his son William. Fāithorñe is especially famous as a portrait painter, and among those on whom his fame rests there were a large number of eminent persons, including Sir Henry Spelman, Oliver Cromwell, Henry Somerset, the marquis of Worcester, John Milton, Queen Catherine, Prince Rupert, Cardinal Richelieu, Sir Thomas Fairfax, Thomas Hobbes, Richard Hooker, Robert second earl of Essex, and Charles I. All his works are remarkable for their combination of freedom and strength with softness and delicacy, and his crayon paintings unite to these the additional quality of clear and brilliant colouring.

He is the author of a work on engraving (1692).

His son Williams (1656–1686), mezzotint engraver, at an early age gave promise of attaining great excellence, but became idle and dissipated, and involved his father in money debt. Among persons of note whose portraits he engraved are Charles II., Mary princess of Orange, Queen Anne when princess of Denmark, and Charles XII. of Sweden.

The best account of the Fāithornes is that contained in Walpole’s Anecdotes of Painting. A life of Fāithorñe the elder is preserved in the library of the Royal Society, and among the papers of Mr. Bayford, librarian to Lord Oxford, and an intimate friend of Fāithorñe.

Fāizābād, a town of Afghanistan, capital of the province of Badakshan, situated on the Kokcha river. In 1821 it was destroyed by Murad Beg of Kunduz, and the inhabitants removed to Kunduz. But since Badakshan was annexed by Abdur Rahman, the town has recovered its former importance, and is now a considerable place of trade. It is the chief cantonment for eastern Afghanistan and the Panjir region, and is protected by a fort built by the British.

Fajardo, a district and town on the E. coast of Porto Rico, belonging to the department of Humacao. Pop. (1890) of the district, 16,782; and of the town, 3414. The district is highly fertile and is well watered, owing in great measure to its abundant rainfall. Sugar production is its principal industry, but some attention is also given to the growing of oranges and pineapples. The town, which was founded in 1734, is the administrative centre standing 1½ m. from a large and well sheltered bay, at the entrance to which is the cape called Cabeza de San Juan. It is the market town for a number of small islands off the E. coast, some of which produce cattle for export.

Fākhr ud-dīn Rāzī (1149–1209), Arabian historian and theologian, was the son of a preacher, himself a writer, and was born at Rai (Rei, Rhagae), near Tehran, where he received his earliest training. Here and at Marāgha, whither he followed his teacher Majd ud-dīn al-jīlī, he studied philosophy and theology. He was a Shafī‘ī in law and a follower of Ashārī (q.v.) in theology, and became renowned as a defender of orthodox mysticism. During a journey in Khwarzim and Mawara‘l-nahr he preached both in Persian and Arabic against the sects of Islam. After this tour he returned to his native city, but settled later in Herat, where he died. His dogmatic positions may be seen from his work Kīthb ud-Muḥassal, which is analysed by Schmolders in his Essai sur les écoles philosophiques chez les Arabes (Paris, 1842). Extracts from his History of the Dynasties were published by Jourdain in the Fundgruben des Orientes (vol. v.), and by D. R. Hicks in his Henry of Peckham (1895). His greatest work is the Mafṣūṭīk ud-Cardh ("the Clark’s commentary"), an extensiv commentary on the Koran published at Cairo (8 vols., 1890) and elsewhere; it is specially full in its exposition of Ashārī theology and its use of early and late Mu‘ażzītite writings.

For an account of his life see F. Wüstefeld’s Geschichte der arabischen Ärzte, No. 200 (Göttingen, 1840); for a list of his works cf. C. Brockelmann’s Gesch. der arabischen Literatur, vol. i. (Weimar, 1898), pp. 506 ff. An account of his teaching is given by M. Schreiner in the Zeitschrift der deutschen morgenländischen Gesellschaft (vol. 52, pp. 505 ff.).

Fākīr (from Arabic faqīr, "poor"), a term equivalent to Derwīsh (q.v.) or Mahommedan religious mendicant, but which has come to be specially applied to the Hindu devotees and ascetics of India. There are two classes of these Indian Fākīrs, (1) the religious orders, and (2) the nomad rogues who infest the country. The ascetic orders resemble the Franciscans of Christianity. The bulk lead really excellent lives in monasteries, which are centres of education and poor-relief; while others go out to visit the poor as Gurus or teachers. Strict celibacy is not enforced among them. These orders are of very ancient date, owing their establishment to the ancient Hindu rule, followed by the Buddhists, that each "twice-born" man should lead in the woods the life of an ascetic. The second class of Fākīrs are simply disreputable beggars who wander round extorting, under the guise of religious indulgence, money from the charitable and practicing the superstitions of the villagers. As a rule they make no real pretence of leading a religious life. They are said to number nearly a million. Many of them are known as "Jogi," and lay claim to miraculous powers which they declare have become theirs by the practice of abstinence and extreme austerities. The tortures which some of these wretches will inflict upon themselves are almost incredible. They will hold their arms over their heads until the muscles atrophy, will keep their fists clenched till the nails grow through the palms, will lie on beds of nails, cut and stab themselves, drag, week after week, enormous chains loaded with masses of iron. This is that a life near enough to scoff. Most of them are inexpressibly filthy and verminous. Among the filthiest are the Aghoria, who preserve the ancient cannibal ritual of the followers of Siva, eat flesh, and use a human skull as a drinking-vessel. Formerly the fakirs were always nude and smeared with ashes; but now they are compelled to wear some pretence of clothing. The natives do not really respect these wandering friars, but they dread their curses.

See John Campbell Oman, The Mystic, Ascetics and Saints of India (1903), and Indian Census Reports.

Pālaise, a town of north-western France, capital of an arrondissement in the department of Calvados, on the right bank of the Ante, 10 m. S. by E. of Caen by road. Pop. (1906)
The principal object of interest is the castle, now partly in ruins, but formerly the seat of the dukes of Normandy, and the birthplace of William the Conqueror. It is situated on a lofty crag overlooking the town, and consists of a square mass defended by towers and flanked by a small donjon and a lofty tower added by the English in the 15th century; the rest of the castle dates chiefly from the 12th century. Near the castle, in the Place de la Trinité, is an equestrian statue in bronze of William the Conqueror, to whom the town owes its prosperity. The churches of La Trinité and St Gervais combine the Gothic and Renaissance styles of architecture, and St Gervais also includes Romanesque workmanship. A street passes by way of a tunnel beneath the church of La Trinité. Falaise has populous suburbs, one of which, Givaudan, is famous for its annual fair for horses, cattle, and wool, which has been held in August since the 12th century. The town is the seat of a subprefecture and has tribunals of first instance and commerce, a chamber of arts and manufacture, a board of trade-arbitrators and a communal college. Tanning and important manufactures of hosiery are carried on.

From 1417, when after a siege of forty-seven days it succumbed to the French, Falaise was in the hands of the English.

**FALASHAS** (i.e. exiles; Ethiopic "fale", a stranger), or "Jews of Abyssinia," a tribe of Hamitic stock, akin to Galla and Somali and is in origin. They claim to be descended from the ten tribes banished from the Holy Land. Another tradition assigns them as ancestor Menelek, Solomon's alleged son by the queen of Sheba. There is little or no physical difference between them and the typical Abyssinians, except perhaps that their eyes are a little more oblique; and they may certainly be regarded as Hamitic. It is uncertain when they became Jews: one account suggests in Solomon's time; another, at the Babylonian captivity; a third, during the 1st century of the Christian era. That one of the earlier dates is correct seems probable from the fact that the Talmud knows nothing of either the Babylonian or Jerusalem Talmud, make no use of phyllacterys (tefilin), and observe neither the feast of Purim nor the dedication of the temple. They possess—not in Hebrew, of which they are altogether ignorant, but in Ethiopic (or Geez)—the canonical and apocryphal books of the Old Testament; a volume of extracts from the Pentateuch, with comments given to Moses by God on Mount Sinai; the Te-ee-sa-sa Sanbat, or laws of the Sabbath; the Ardit, a book of secrets revealed to twelve saints, which is used as a charm against disease; lives of Abraham, Moses, &c.; and a translation of Josephus called Sina Albud. A copy of the Orit or Mosaic law is in circulation. The Talmuds must prepare all their food with their own hands, and no lay person, male or female, may enter their houses. Celibacy is not practised by the priests, but they are not allowed to marry a second time, and no one is admitted into the order who has eaten bread with a Christian, or is the son or grandson of a man thus contaminated. Belief in the evil eye or shadow is universal, and spirit-raisers, soothsayers and rain-doctors are in repute. Education is in the hands of the monks and priests, and is confined to boys. Fasts, obligatory on all above seven years of age, are held every Monday and Thursday, on every new moon, and at the passover (the 21st or 22nd of April). The annual festivals are the passover, the harvest feast, the Bala Mazalat or feast of tabernacles (during which, however, no booths are built), the day of covenant or assembly and Abraham's day. It is believed that after death the soul remains in a place of darkness till the third day, when the first sacrifice for the dead is offered; prayers are read in the synagogue for the repose of the departed, and for seven days a formal lament takes place every morning in his house. No coffins are used, and a stone vault is built over the corpse so that it may not come into direct contact with the earth.

The Falashas are an industrious people, living for the most part in villages of their own, or, if they settle in a Christian or Moslem town, occupying a separate quarter. They had their own kings, who, they pretend, were descended from David, from the 10th century until 1500, when the royal race became extinct, and they then became subject to the Abyssinian kingdom of Tigre. They do not mix with the Abyssinians, and never marry Abyssinians. They are even forbidden to enter the houses of Christians, and from such a pollution have to be purified before entering their own houses. Polygamy is not practised; early marriages are rare, and their morals are generally better than those of their Christian masters. Unlike most Jews, they have no liking for trade, but are skilled in agriculture, in the manufacture of pottery, ironware and cloth, and are good masons. Their numbers are variously estimated at from one hundred to one hundred and fifty thousand.

**FALCÃO, CHRISTOVAL DE SOUSA** (? 1512—1557), Portuguese poet, came of a noble family settled at Portalegre in the Alemtejo, which had originated with John Falcon or Falconet, one of the Englishmen who went to Portugal in 1536 in the suite of Philippa of Lancaster. His father, João Vaz de Almada Falcão, was an upright public servant who had held the captenancy of Elmina on the West African coast, but died, as he had lived, a poor man. There is a tradition that in boyhood Christoval fell in love with a beautiful child and rich heiress, D. Maria Brandão, and in 1526 married her clandestinely, but parental opposition prevented the ratification of the marriage. Family pride, it is said, drove the father of Christoval to keep his son under strict surveillance in his own house for five years, while the lady's parents, objecting to the youth's small means, put her into the Cistercian convent of Lorvão, and there endeavoured to wean her heart from him by the accusation that he coveted her fortune more than her person. Their arguments, and the prominence of his own family, forced Maria to become a nun in 1534. D. Maria left the convent to marry D. Luis de Silva, captain of Tanger, while the broken-hearted Christoval told his sad story in some beautiful lyrics and particularly in the eclogue *Christifal*. He had been the disciple and friend of the poets Bernardim Ribeiro and Sá de Miranda, and when his great disappointment came, Falcão laid aside poetry and entered on a diplomatic career. There is documentary evidence that he was employed at the Portuguese embassy in Rome in 1542, but he soon returned to Portugal, and we find him at court again in 1548 and 1551. The date of his death is uncertain, but a work styled, by Dr Theophilo Braga, the historian of Portuguese literature, but Sebba Guimarães shows that the first part is doubtful, and, putting aside the testimony of a contemporary and grave writer, Diogo do Couto, he even denies the title of poet to Christoval Falcão, arguing from internal and other evidence that *Christifal* is the work of Bernardim Ribeiro; his destructive criticism is, however, stronger than his constructive work. The eclogue, with its 104 verses, is the very poem of *saudade*, and its simple, direct language and cadence and tender feeling, enshrined in exquisitely sounding verses, has won for its author lasting fame and a unique position in Portuguese literature. Its influence on later poets has been very considerable, and Camões used several of the verses as proverbs.

The poetical works of Christoval Falcão were published anonymously, owing, it is supposed, to their personal nature and allusions,
and, in part or in whole, they have been often reprinted. There is a modern critical edition of *Christifal* and a *Carta* (letter) by A. Epifaniño da Silva Dias under the title *Obras de Cristíndal Falção* (Oporto, 1893), and one of the *Cantigas* and *Espartas* by the same scholar appeared in the *Revista Lusitana*, vol. 4, pp. 142-179 (Lisbon, 1896), under the name *Fragmento de un Canticoresco do Século X VI*. See *Hermes* (Ribeiro e o Baculismo), by Dr. T. Brama (Oporto, 1897), and *Bernardim Ribeiro* (O Patao Cristal), by Delfim Guimarães (Lisbon, 1908).

**FALCK, ANTON REINHARD** (1777-1843). Dutch statesman, was born at Utrecht on the 18th of March 1777. He was educated at the university of Leiden, and entered the Dutch diplomatic service, being appointed to the legation at Madrid. Under King Louis Napoleon he was secretary-general for foreign affairs, but resigned office on the annexation of the Batavian republic to France. He took a leading part in the revolt of 1813 against French domination, and had a considerable share in the organization of the new kingdom of the Netherlands. As minister of education under William I. he reorganized the universities of Ghent, Louvain and Liège and the Royal Academy of Brussels. Side by side with his activities in education he directed the department of trade and the colonies. Falck was called in Holland the king's good genius, but William I. presently tired of his counsels and he was superseded by Van Maanen. He was ambassador in London when the disturbances of 1830 convinced him of the necessity of the separation of Belgium from Holland. He subsequently resigned his post and lived in close retirement until 1839, when he became the first Dutch minister at the Belgian court. He died at Brussels on the 10th of March 1843. Besides some historical works he left a correspondence of considerable political interest, printed in *Brieven van A. R. Falck*, 1795-1843 (2 vols., The Hague, 1861), and *Ambtsbrieven van A. R. Falck* (ibid. 1878).

**FALCON**, the most northern state of Venezuela, with an extensive coast line on the Caribbean Sea and Gulf of Venezuela. Pop. (1905 est.) 175,968. It lies between the Caribbean on the N. and the state of Lara on the S., with Zulia and the Gulf of Venezuela on the W. Its surface is much broken by irregular ranges of low mountains, and extensive areas on the coast are sandy plains and tropical swamps. The climate is hot, but, being tempered by the trade winds, is not considered unhealthy except in the swampy districts. The state is sparsely settled and divided into two departments, its capital, Coro, being important chiefly because of its history, and as the entrepôt for an extensive inland district. The only port in the state is La Vela de Coro, on a small bay of the same name, 7 m. E. of the capital, with which it is connected by railway.

**FALCON** (Lat. Falco; Fr. Fauxon; Teutonic, Falk or Valken), a word now restricted to the high-couraged and long-winged birds of prey which take their quarry as it moves; but formerly it had a very different meaning, being by the naturalists of the 18th and even of the 19th century extended to a great number of birds comprised in the genus Falco of Linneaus and writers of his day, while, on the other hand, by falconers, it was, and still is, technically limited to the female of the birds employed by them in their vocation (see *Falconry*), whether "long-winged" and therefore "noble," or "short-winged" and "ignoble."

According to modern usage, the majority of the falcons, in the sense first given, may be separated into five very distinct groups: (1) the falcons pure and simple (*Falco* proper); (2) the large northern falcons (*Hierofalco*; Cuvier); (3) the "desert falcons" (*Gennaeus*, Kaup); (4) the merlins (*Acelon*, Kaup); and (5) the hobbies (*Hypotrichochus*, Boie). A sixth group, the kestrels (*Falco tinnunculus*, Vieillot), is often added. This, however, appears to have been justifiably reckoned a distinct genus.

The typical falcon is by common consent allowed to be that almost cosmopolitan species to which unfortunately the English epithet "peregrine" (i.e. strange or wandering) has been attached. It is the *Falco peregrinus* of Tustall (1771) and of most recent ornithologists, though some prefer the specific name *commonis* applied by J. F. Gmelin a few years later (1788) to a bird, which, if its diagnosis be correct, could not have been a true falcon at all, since it had yellow irides—a colour never met with in the eyes of any bird now called by naturalists a "falcon."

This species inhabits suitable localities throughout the greater part of the globe, though examples from North America have by some received specific recognition as *F. anatum* (the "duck-hawk"), and those from Australia have been described as distinct under the name of *F. melanogenys*. Here, as in so many other cases, it is almost impossible to decide as to which forms should, and which should not, be accounted merely local races. In size not surpassing a raven, this falcon (fig. 1) is perhaps the most powerful bird of prey for its bulk that flies, and its courage is not less than its power. It is the species, in Europe, most commonly trained for the sport of hawking (see *Falconry*). Volumes have been written upon it, and to attempt a complete account of it is, within the limits now available, impossible. The plumage of the adult is generally blackish-blue above, and white, with a more or less deep cream-coloured tinge, beneath—the lower parts, except the chin and throat, being barred transversely with black, while a black patch extends from the bill to the ear-coverts, and descends on either side beneath the mandible. The young have the upper parts deep blackish-brown, and the lower white, more or less strongly tinged with ochraceous-brown, and striped longitudinally with blackish-brown. From Port Kennedy, the most northern part of the American continent, to Tasmania, and from the shores of the Sea of Okhotsk to Mendoza in the Argentine territory, there is scarcely a country in which this falcon has not been found. Specimens have been received from the Cape of Good Hope, and it is only a question of the technical differentiation of species whether it does not extend to Cape Horn. Fearless as it is, and adapting itself to almost every circumstance, it will form its eyry equally on the sea-washed cliffs, the craggy mountains, or (though more rarely) the drier spots of a marsh in the northern hemisphere, as on trees (says H. Schlegel) in the forests of Java or the waterless ravines of Australia. In the United Kingdom it was formerly very common, and hardly a high rock from the Shetlands to the Isle of Wight.
but had a pair as its tenants. But the British gamekeeper has long held the mistaken faith that it is his worst foe, and the number of pairs now allowed to rear their brood unmolested in the British Islands is very small. Yet its utility to the gamepreserver, by destroying every one of its most precious wards that shows any sign of infirmity, can hardly be questioned by reason, and G. E. Freeman (Falconry) has earnestly urged its claimed protection. Nearly allied to this falcon are several species, such as F. barbarus of Mauretania, F. minor of South Africa, the Asiatic F. babylonicus, F. peregrinator of India (the shahleen), and perhaps F. cassini of South America, with some others.

Next to the typical falcons comes a group known as the "great northern" falcons (HieroFalco). Of these the most remarkable is the gyrfalcon (F. gryfalcon), whose home is in the Scandinavian mountains, though the young are yearly visitants to the plains of Holland and Germany. In plumage it very much resembles F. peregrinus, but its flanks have generally a bluer tinge, and its superiority in size is at once manifest. Nearly allied to it is the Iceland falcon (F. islandus), which externally differs in its paler colouring and in almost entirely wanting the black mandibular patch. Its proportions, however, differ a good deal, its body being elongated. Its country is shown by its name, but it also inhabits South Greenland, and not infrequently makes its way to the British Islands. Very close to this comes the Greenland falcon (F. candidans), a native of north Greenland, and perhaps of other countries within the Arctic Circle. Like the last, the Greenland falcon from time to time occurs in the United Kingdom, but it is always to be distinguished by wearing a plumage in which at every age the prevailing colour is pure white. In north-eastern America these birds are replaced by a kindred form (F. labradorus), first detected by Audubon and subsequently recognized by Dresser (Orn. Miscell. i. 135). It is at once distinguished by its very dark colouring, the outer parts being occasionally almost as deeply tinted at all ages as the upper.

All the birds hitherto named possess one character in common. The darker markings of their plumage are longitudinal before the first real moults take place, and for ever afterwards are transverse. In other words, when young the markings are in the form of bars, later in stripes, when old in the form of bars. The variation of tint is very great, especially in F. peregrinus; but the experience of falconers, whose business it is to keep their birds in the very highest condition, shows that a falcon of either of these groups if light-coloured in youth is light-coloured when adult, and if dark when young is also dark when old—age, after the first moult, making no difference in the complexion of the bird. The next group is that of the so-called "desert falcons" (Gennaeo), wherein the difference just indicated does not obtain, for long as the bird may live and often as it may moult, the original style of markings never gives way to any other. Foremost among these are to be considered the lanner and the saker (commonly termed F. lanarius and F. sacer), both well known in the palmy days of falconry, but only since about 1845 readmitted to full recognition. Both of these belong properly to south-eastern Europe, North Africa and south-western Asia. They are, for their bulk, less powerful than the members of the preceding group, and though they may be trained to high flights are naturally captors of humbler game. The precise number of species is very doubtful, but among the many candidates for recognition especially are to be named the lugger (F. jugger) of India, and the prairie falcon (F. mexicanus) of the western plains of North America.

The systematist finds it hard to decide in what group he should place two somewhat large Australian species (F. hypoleucus and F. subniger), both of which are rare in collections—the latter especially.

A small but very beautiful group comes next—the merlins (Aesalon of some writers, Lithofalco of others). The European merlin (F. aestivalis) is perhaps the boldest of the Accipitres, not hesitating to attack birds of twice its own size, and even on occasion threatening human beings. Yet it readily becomes tame, if not affectionate, when reclaimed, and its ordinary prey consists of the smaller Passeres. Its "pinion of glossy blue" has become almost proverbial, and a deep ruddy blush suffuses its lower parts; but these are characteristic only of the male—the female maintaining very nearly the sober brown plumage she wore when as a nestling she left her lowly cradle in the heather. Very close to this bird comes the pigeon-hawk (F. columbarius) of North America—so close, indeed, that none but an expert ornithologist can detect the difference. The turumti of Anglo-Indians (F. chicquera), and its representative from southern Africa (F. ruficollis), also belong to this group, but they are considerably larger than either of the former.

Lastly, the Hobbies (Hypotarctes) comprise a greater number of forms—though how many seems to be doubtful.

Fig. 2.—Merlin.

They are in life at once recognizable by their bold upstanding position, and at any time by their long wings. The type of this group is the English hobby (F. subbuteo), a bird of great power of flight, chiefly shown in the capture of insects, which form its

French, Embrillon; Icelandic, Smirill.
ordinary food. It is a summer visitant to most parts of Europe, including the British Islands, and is most wantonly and needlessly destroyed by gamekeepers. A second European species of the group is the beautiful F. eleonora, which hardly comes farther north than the countries bordering the Mediterranean, and, though in some places abundant, is an extremely local bird. The largest species of this section seems to be the Neotropical F. femoralis, for F. droleus though often ranked here, is now supposed to belong to the group of typical falcons. (A. N.)

FALCONE, ANIELLO (1660-1665), Italian battle-painter, was the son of the few grocer, 1837 the He text the the relative, the the text are zeal. They established Forres him 140 of the establishment of the delta correction. FALCONE, W.

for the text of the artesian tendency at an early age, received some instruction from a relative, and then studied under Ribera (Lo Spagnotto), of whom he ranks as the most eminent pupil. Besides battle-pictures, large and small, taken from biblical as well as secular history, he painted various religious subjects, which, however, count for little in his general reputation. He became, as a battle-painter, almost as celebrated as Borghognone (Courtisot), and was named "L'Oracolo delle Battaglie." His works have animation, variety, truth to nature, and careful colour. Falcone was bold, generous, used to arms, and an excellent fencer. In the insurrection of Masaniello (1647) he resolved to be bloodily avenged for the death, at the hands of two Spaniards, of a nephew and of a pupil in the school of art which he had established in Naples. He and many of his scholars, including Salvator Rosa and Carlo Coppola, formed an armed band named the Compagnia della Morte ("Company of Death"); see ROSA, SALVATOR. They scoured the streets by day, exulting in slaughter; at night they were painters again, and handled the brush with impetuous zeal. Peace being restored, they had to decamp. Falcone and Rosa made off to Rome; here Borghognone noticed the works of Falcone, and became his friend, and a French gentleman induced him to go to France, where Louis XIV. became one of his patrons. Ultimately Colbert obtained permission for the painter to return to Naples, and there he died in 1665. Two of his battle-pieces are to be seen in the Louvre and in the Naples museum; he painted a portrait of Masaniello, and engraved a few plates. Among his principal scholars, besides Rosa and Coppola (whose works are sometimes ascribed to Falcone himself), were Domenico Gargiulo (named Mico Spadaro), Paolo Porpora and Andrea di Liono.

FALCONE, HUGH (1808-1866), British palaeontologist and botanist, descended from an old Scottish family, was born at Forres on the 29th of February 1808. In 1826 he graduated at Aberdeen, where he manifested a taste for the study of natural history. He afterwards studied medicine in the university of Edinburgh, taking the degree of M.D. in 1829; during this period he zealously attended the botanical classes of Prof. R. Graham (1785-1845), and those on geology by Prof. R. Jameson. Proceeding to India in 1830 as assistant-surgeon of the Bengal establishment of the East India Company, he made on his arrival an examination of the fossil bones from Ava in the possession of the Asiatic Society of Bengal, and, with the aid of a French gentleman induced him to go to France, where Louis XIV. became one of his patrons. Ultimately Colbert obtained permission for the painter to return to Naples, and there he died in 1665. Two of his battle-pieces are to be seen in the Louvre and in the Naples museum; he painted a portrait of Masaniello, and engraved a few plates. Among his principal scholars, besides Rosa and Coppola (whose works are sometimes ascribed to Falcone himself), were Domenico Gargiulo (named Mico Spadaro), Paolo Porpora and Andrea di Liono.

FALCONE, HUGH (1808-1866), British palaeontologist and botanist, descended from an old Scottish family, was born at Forres on the 29th of February 1808. In 1826 he graduated at Aberdeen, where he manifested a taste for the study of natural history. He afterwards studied medicine in the university of Edinburgh, taking the degree of M.D. in 1829; during this period he zealously attended the botanical classes of Prof. R. Graham (1785-1845), and those on geology by Prof. R. Jameson. Proceeding to India in 1830 as assistant-surgeon of the Bengal establishment of the East India Company, he made on his arrival an examination of the fossil bones from Ava in the possession of the Asiatic Society of Bengal, and, with the aid of a French gentleman induced him to go to France, where Louis XIV. became one of his patrons. Ultimately Colbert obtained permission for the painter to return to Naples, and there he died in 1665. Two of his battle-pieces are to be seen in the Louvre and in the Naples museum; he painted a portrait of Masaniello, and engraved a few plates. Among his principal scholars, besides Rosa and Coppola (whose works are sometimes ascribed to Falcone himself), were Domenico Gargiulo (named Mico Spadaro), Paolo Porpora and Andrea di Liono.

FALCONE, WILLIAM (1732-1769), British poet, was born in Edinburgh on the 11th of February 1732. His father was a wig-maker, and carried on business in one of the small shops with wooden fronts at the Netherbow Port, an antique castellated structure which remained till 1764, dividing High Street from the antiquity of the human race, and actually commenced a work on "Primeval Man," which, however, he did not live to finish. He died on the 31st of January 1765. Shortly after his death a committee was formed for the promotion of a "Falconer Memorial." This took the shape of a marble bust, which was placed in the rooms of the Royal Society of London, and of a Falconer scholarship of the annual value of £100, open for competition to graduates in science or medicine of the university of Edinburgh.

Dr Falconer's botanical notes, with 450 coloured drawings of Kew plants, and Indian plants, have been deposited in the Library of the Horticultural Society of London. His Palaeontological Memoirs and Notes, comprising all his papers read before learned societies, have been edited, and published under the direction of Dr Falconer, and a portrait of him was published by his niece, Grace, Lady Prestwich, in her Essays descriptive and biographical (1901).

to enter the royal navy, and before the end of 1762 the poet-sailor was rated as a midshipman on board the "Royal George." But as this ship was paid off at the peace of 1763, Falconer received an appointment as purser of the "Glory" frigate, a situation which he held until that vessel was laid up on ordinary at Chatham. In 1764 he published a new and enlarged edition of The Shipwreck, and in the same year a rhymed political tirade against John Wilkes and Charles Churchill, entitled The Demagogue. In 1769 appeared his Universal Marine Dictionary, in which retrait is defined as a French manoeuvre, "not properly a term of the British marine." While engaged on this dictionary, J. Murray, a bookseller in Fleet Street, father of Byron's minister, published and corresponded, wished him to join him as a partner in business. The poet declined the offer, but became purser of the "Aurora" frigate, which had been commissioned to carry out to India certain supervisors or superintendents of the East India Company. Besides this nomination as purser, Falconer was promised the post of private secretary to the commissioners. Before sailing he published a third edition of his Shipwreck, which had again undergone "correction," but not improvement. The poet sailed in the "Aurora" from Spithead on the 20th of September 1769. The vessel arrived safely at the Cape of Good Hope, and left on the 27th of December. She was never more heard of, having, as is supposed, foundered at sea. The Shipwreck, the poem with which Falconer's name is connected, had a great reputation at one time, but the fine passages which pleased the earlier critics have not saved it from general oblivion.

See his Poetical Works in the "Aldine Edition" (1836), with a life by J. Mitford.

FALCONEt, ETIENNE MAURICE (1716-1791), French sculptor, was born in Paris. His parents were poor, and he was at first apprenticed to a carpenter, but some of his clay-figures, with the making of which he occupied his leisure hours, attracted the notice of the sculptor Lemoine, who made him his pupil. He found time to study Greek and Latin, and also wrote several books on art and literature. His artistic productions are characterized by the same defects as his writings, for though manifesting considerable cleverness and some power of imagination, they display in many cases a false and fantastic taste. The result, most probably, of an excessive striving after originality. One of his most successful statues was one of Milo of Crotone, which secured his admission to the membership of the Academy of Fine Arts in 1754. At the invitation of the empress Catherine he went in 1766 to St Petersburg, where he executed a colossal statue of Peter the Great in bronze. In 1788 he became director of the French Academy of Painting. Many of Falconet's works, being placed in churches, were destroyed at the time of the French Revolution. His "Nymphé descending au bain" is in the Louvre.

Among his writings are Réflexions sur la sculpture (Paris, 1768), and Observations sur la statue de Marc-Aurèle (Paris, 1771). The whole were collected under the title of Œuvres littéraires (5 vols., Lausanne, 1781-1782; 3 vols., Paris, 1787).

FALCONEt (Fr. fauconnerie, from Late Lat. falco, falcon), the art of employing falcons and hawks in the chase, often termed Hawking. Falconry was for many ages one of the principal sports of the richer classes, and, since many more efficacious methods and appliances for the capture of game undoubtedly existed, it is probable that it has always been carried on as a pure sport. The antiquity of falconry is very great. There appears to be little doubt that it was practised in Asia at a very remote period, for which we have the concurrent testimony of various Chinese and Japanese works, some of the latter being most quaintly and yet spiritedly illustrated. It appears to have been known in China some 2000 B.C., and the records of a king Wen Wang, who reigned over a province of that country 699 B.C., prove that the art was at that time in high favour. In Japan it appears to have been known at least 600 years B.C., and probably at an equally early date in India, Arabia, Persia and Syria. Sir A. H. Layard, in his Ninevah and Babylon, considered that in a bas-relief found by him in the ruins of Khorsabad "there appeared to be a falconer bearing a hawk on his wrist," from which it would appear to have been known there some 1700 years B.C. In all the above-mentioned countries of Asia it is practised at the present day.

Little is known of the early history of falconry in Africa, but from very ancient Egyptian carvings and drawings it seems to have been known there many ages ago. It was probably also in vogue in the countries of Morocco, Oran, Algiers, Tunis and Egypt, at the same time as in Europe. The older writers on falconry, English and continental, often mention Barbary and Tunisian falcons. It is still practised in Egypt.

Perhaps the oldest records of falconry in Europe are supplied by the writings of Pliny, Aristotle and Martial. Although their notices of the sport are slight and somewhat vague, yet they are quite sufficient to show clearly that it was practised in their time. Pliny, about the year 70 A.D., mentions the ring-necked pheasant as a bird to which hawks were trained. But Pliny was writing after the time when the Romans introduced falconry from the continent about A.D. 86, and from that time down to the middle of the 17th century falconry was followed with an ardour that perhaps no English sport has ever called forth, not even fox-hunting. Stringent laws and enactments, notably in the reigns of William the Conqueror, Edward III., Henry VIII. and Elizabeth, were passed from time to time in its interest. Falcons and hawks were allotted to degrees and orders of men according to rank and station—for instance, to the emperor the eagle and vulture, to royalty the jerfalcon, to a yeoman the goshawk, to a priest the sparrow-hawk, and to a knave or servant the useless kestrel. The writings of Shakespeare furnish ample testimony to the high and universal estimation in which it was held in his days. About the middle of the 17th century falconry began to decline in England, to revive somewhat at the Restoration. It never, however, completely recovered its former favour, a variety of causes operating against it, such as enclosure of waste lands, agricultural improvements, and the introduction of fire-arms into the sporting field, till it fell, as a national sport, almost into oblivion. Yet it has never been even temporarily extinct, and it is successfully practised even at the present day. In England it is no longer a "gentleman's sport," as it has never been. The sport at which hawks are trained consists of grouse (confined to the British Isles), black-game, pheasants, partridges, quails, sandhares, ducks, teal, woodcocks, snipes, herons, crows, gulls, magpies, jays, blackbirds, thrushes, larks, hares and rabbits. In former days geese, cranes, kites, ravens and bustards were also flown at. Old German works make much mention of the use of the Iceland falcon for taking the great bustard, a flight scarcely alluded to by English writers. In Asia the list of quarry is longer, and, in addition to all the foregoing, or their Asiatic representatives, various kinds of bustards, sand grouse, storks, ibises, spoonbills, peacock-jungle-fowl, kites, vultures and gazelles are captured by trained hawks. In Mongolia and Chinese Tartary, and among the nomad tribes of central Asia, the sport still flourishes; and though some late accounts are not satisfactory either to the falconer or the naturalist, yet they leave no doubt that a species of eagle is still trained in those regions to take large game, as antelopes and wolves. Mr Atkinson, in his account of his travels in the country of the Amur, makes particular mention of the sport, as does also Mr Shaw in his work on Yarkand; and in a letter from the Yarkand embassy, under Mr Forsyth, C.B., dated Camp near Yarkand, Nov. 27, 1873, the following passage occurs:—"Hawking appears also to be a favourite amusement, the golden eagle taking the place of the falcon or hawk. This novel sport seemed very successful." It is questionable whether the bird here spoken of is the golden eagle. In Africa gazelles are taken, and also partridges and wildfowl.

The hawks used in England are the three great northern falcons, viz. the Greenland, Iceland and Norway falcons, the peregrine falcon, the hobby, the merlin, the goshawk and the sparrow-hawk. In former days the saker, the lanner and the Barbary or Tunisian falcon were also employed. (See Falcon.) Of the foregoing the easiest to keep, most efficient in the field, and most suitable for general use are the peregrine falcon and the goshawk.

In all hawks, the female is larger and more powerful than the male.
FALCONRY

Hawks are divided by falconers all over the world into two great classes. The first class comprises "falcons," i.e. "long-winged hawks," or hawks of the lure, distinguished by Eastern falconers as "dark-eyed hawks." In these the wings are pointed, the second feather in the wing is the longest, and the iris of a deep, dark-brown hue. Merlins must, however, be excepted; and here it would seem that the Eastern distinction is the better, for though merlins are much more falcons than they are hawks, they differ from falcons in having the third feather in the wing the longest, while they are certainly "dark-eyed hawks.

The second class is that of "hawks," i.e. "short-winged hawks," or "hawks of the fist," called by Eastern falconers "yellow (or rose) eyed hawks." In these the wings are rounded, the fourth feather is the longest in the wing, and the iris is yellow, orange or deep-orange.

The following glossary of the principal terms used in falconry may assist the reader in perusing this notice of the practice of the art. Useless or obsolete terms are omitted:

Austrignan.—A falconer.
Bate.—A hawk is said to "bate" when she flutters off from the fist, perch or block, whether from wildness, or for exercise, or in the attempt to chase.
Beast.—Straps of leather by which the bells are fastened to a hawk's legs.
Bind.—A hawk is said to "bind" when she seizes a bird in the air and clings to it.
Block.—The conical piece of wood, of the form of an inverted flower-pot, used for hawks to sit upon; for a peregrine it should be about 10 to 12 in. high, 5 to 6 in diameter at top, and 8 to 9 in diameter at base.
Braid.—A thong of soft leather used to secure, when desirable, the wing of a hawk. It has a slit to admit the pinion joint, and the ends are tied together.
Cadge.—The wooden frame on which hawks, when numerous, are carried to the field.
Cadge.—The person who carries the cadge.
Carry.—A hawk is said to "carry" when she flies away with the quarry on the approach of the falconer.
Cast.—Two hawks which may be used for flying together are called a "cast," not necessarily a pair.
Casting.—The oblong or egg-shaped ball, consisting of feathers, bones, &c., which all hawks (and insectivorous birds) throw up after the nutritious part of their food has been digested. Also the fur or feathers given them to assist the process.
Cere.—The naked wax-like skin above the beak.
Check.—A hawk is said to "check" when she flies at a bird other than the intended object of pursuit.
Clutching.—Taking the quarry in the feet as the short-winged hawks do. Falcons occasionally "clutch." Come to a.—A hawk is said to "come to" when she begins to tame.
Cop.—Cutting the beak or talons of a hawk.
Crest.—To fight.
Creese.—A long line or string.
Crop, to put away.—A hawk is said to "put away her crop" when the food passes out of the crop into the stomach.
Deck feathers.—The two centre tail-feathers.
Eyes.—A hawk which has been brought up from the nest (nyas, from Fr. niais).
Eyry.—The nest of a hawk.
Foot.—A hawk is said to "foot" well or to be a "good footer" when she is successful in killing. Many hawks are very fine fliers without being "good footers."
Fronce.—A discoloration in the mouth and throat of hawks.
Get in.—To go up to a hawk when she has killed her quarry.
Hack.—The state of partial liberty in which young hawks must always at first be kept.
Haggard.—A wild-caught hawk in the adult plumage.
Hood.—(See fig.)
Hoodshy.—A hawk is said to "hoodshy" when she is afraid of, or resists, having her hood put on.
Hunger.—A defect in the feathers and in the tail, denoting a weak point; generally due to temporary starvation as a nestling.
Impair.—The process of mending broken feathers is called "impair." (See fig.)
Impairing needle.—A piece of tough soft iron wire from about 2½ to 3½ in. long, rough filed so as to be three-sided and tapering from the middle to the ends. (See fig.)
Intermeed.—A hawk-mouted in confinement is said to be "intermeeded."

Jack.—Mate of the merlin.
Jerkin.—Mate of the jalfalcon.
Jesses.—Strips of light but very tough leather, some 6 to 8 in. long, which always remain on a hawk's legs—one on each leg. (See fig.)
Jork.—To sleep.
Leash.—A strong leather thong, some 2¹/₂ or 3 ft. long, with a knob or button at one end, used to secure a hawk. (See fig.)
Lure.—The instrument used for calling long-winged hawks—a dead pigeon, or an artificial lure made of leather and feathers or wings of birds, tied to a string, with meat attached to it.
Mail.—The breast feathers.
Make hawk.—A hawk is called "make hawk" when, as a thoroughly trained and steady hawk, she is flown with young ones to teach them their work.
Man a hawk.—To tame a hawk and accustom her to strangers.

24. Fit, &c., to be pushed home into
25. Living bird's feather.

Mantle.—A hawk is said to "mantle" when she stretches out a leg and a wing simultaneously, a common action of hawks when at ease; also when she spreads out her wings and feathers to hide any quarry or food she may have seized from another hawk, or from man. In the last case it is a fault.
Mew.—A hawk is said to "mew" when she moults. The place where a hawk was kept to moulte in olden times called her "mew." Buildings where establishments of hawks were kept were called "mews."
Muskel.—Male of the sparrow-hawk.
Mules (mulings).—Excrement of hawk.
Nest.—The stomach of a hawk, corresponding with the gizzard of a fowl, is called her pannel. In it the casting is formed.
Passage.—The line herons take over a tract of country on their way to and from the heronry when procuring food in the breeding season.
Passage hawks.—Hawks captured when on their passage or migration.
Pelt.—The dead body of any quarry the hawk has killed.
Pich.—The height to which a hawk, when waiting for game to be flushed, rises in the air.
Plume.—A hawk is said to "plume" a bird when she pulls off the feathers.

Poiting.—A hawk "makes her point," when she rises in the air over the spot where quarry has saved itself from capture by darting into a hedge, or has otherwise secreted itself.

Framess.—A hawk's claws.

Pull through the hood.—A hawk is said to pull through the hood when she eats with it on.

Put in.—A bird is said to "put in" when it saves itself from the hawk by darting into a covert or other place of security.

Quarry.—The bird or beast flown at.

Rake out.—A hawk is said to "rake out" when she flies, while waiting on it. (see Wait on), too far and wide from her master.

Rame.—A hawk's head.

Red hawk.—Hawks of the first year, in the young plumage, are called "red hawks.

Ring.—A hawk is said to "ring" when it rises spirally in the air.

Red hood.—A hawk's hood, not, however, convenient for hooding and unhooding—used only for hawks when first captured. (See fg.)

Sails.—The wings of a hawk.

Seeing.—Closing the eyes by a fine thread drawn through the lid of each eye, the threads being then twisted together above the head—a practice long disused in England.

Serving a hawk.—Draining out quarry which has taken refuge, or has "put in."

Stoop.—The hawk's rapid plunge upon the quarry.

Take the air.—A bird is said to take the air, when it seeks to gain height, or to rise higher than the hawk. (See Tiercel.)

Tiercel.—The male of various falcons, particularly of the peregrine, also tessel, tasseled or terced; the term is also applied to the male hawks of hawk.

Trussing.—A hawk is said to "truss" a bird when she catches it in the air, and comes to the ground with it in her talons. This term is not applied to large quary. (See Bind.)

Varied.—Hawks are generally of varying size, proceeding to the end of the jesses, and engraved with the owner's name.

Wait on.—A hawk is said to "wait on" when she flies above her master waiting till game is sprung.

Weathering.—Hawks are "weathered" by being placed unhooded in the open air. Passage hawks which are not sufficiently reclaimed to be left out by themselves unhooded on blocks are "weathered" by being put out for an hour or two under the falconer's eye.

Yarh.—An Eastern term, generally applied to short-winged hawks. When a hawk is keen, and in hunting condition, she is said to be "in yarh."

The training of hawks affords much scope for judgment, experience and skill on the part of the falconer, who must carefully observe the temper and disposition as well as the constitution of each bird. It is through the appetite principally that hawks, like most wild animals, are tamed; but to fit them for use in exhibition, gentleness and care must be used. Slovenly taming necessitates starving, and low condition and weakness are the result. The aim of the falconer must be to have his hawks always keen, and the appetite when they are brought into the field should be such as would induce the bird in a state of nature to put forth its full powers to obtain its food, with, as near as possible, a corresponding condition as to flesh.

The following is an outline of the process of training hawks, beginning with the management of a wild-caught peregrine falcon. When first taken, a ruffet hood should be put on her head, and she must be furnished with jesses, swivel, leach and bell. A thick glove or rather gauntlet must be worn on the left hand (Eastern falcons always carry a hawk on the right), and she must be carried about as much as possible, late into the night, every day, being constantly stroked with a bird's wing or feather, very lightly at first. At night she should be tied to a perch in a room with the window darkened, so that no light can enter in the morning. The perch should be a padded pole placed across the room, about 4½ ft. from the ground, with a canvas screen underneath. She will easily be induced to feed in most cases by drawing a piece of beefsteak over her feet, brushing her legs at the time with a wing, and now and then, as she snaps, slipping a morsel into her mouth. Care must be taken to make a peculiar sound with the lips or tongue, or to use a low whistle as she is in the act of swallowing; she will very soon learn to associate this sound with feeding, and it will be found that directly she hears it, she will grasp with her talons, and bend down to feel for food. When the falconer perceives this and other signs of her "coming to," that she no longer starts at the voice or touch, and steps quietly up from the perch when the hand is placed under her feet, it will be time to change her ruffet hood for the ordinary hood. This latter should be very carefully chosen—an easy fitting one, in which the braces draw close, and yet easily and without jerking. An old one previously worn is to be recommended. The hawk should be taken into a very dark room—one absolutely dark is best—and the change should be made if possible in total darkness. After this she must be brought to feed with her hood off; at first she must be fed every day in a dark room, a gleam of light being admitted. The first day, the hawk will be seized when it comes, and begun to pull at it freely, the hood must be gently slipped off; when she has eaten a moderate quantity, it must be replaced as slowly and gently as possible, and she should be allowed to finish her meal through the hood. Next day the hawk may be twice removed, and so on; day by day the practice should be continued, and more light gradually admitted, until the hawk will feed freely in broad daylight, and suffer the hood to be taken off and replaced without opposition. Next she must be accustomed to see and feed in the presence of strangers and dogs, &c. A good plan is to carry her in the streets of a town at night, at first where the gas-light is not strong, and where persons passing by are few, unhooding and hooding her from time to time, never letting her get frightened. Up to this time she should be fed on lean beefsteak with no castings, but as soon as she is tolerably tame and submits well to the hood, she must occasionally be fed with pigeons and other birds. This should be done not later than 3 or 4 p.m., and when she is placed on her perch for the night in the dark room, she must be unhooded and left so, of course being carefully tied up. The falconer should enter the room about 7 or 8 a.m. next day, admiring as little light as possible, or using a candle. He should first observe if she has thrown her casting; if so, he will now place the food and give her a bite of food, and re-hood her. If her casting is not thrown it is better for him to retire, leaving the room quite dark, and come in again later. She must now be taught to know the voice—the shout that is used to call her in the field—and to jump to the fist for food, the voice being used every time she is fed. When she comes freely to the fist she must be made acquainted with the lure. Kneeling down with the hawk on his fist, and gently unhooding her, the falconer casts out a lure, which may be either a dead pigeon or an artificial lure garnished with a bit of lard tied to it, to a distance of a couple or three feet in front of her. When the hawk is induced to snap at the lure, she is allowed to eat a little on it—the voice being used—the while receiving morsels from the falconer's hand; and before her meal is finished she must be taken off to the hand, being induced to forsake the lure for the hand by a tempting piece of meat. This treatment will help to check her inclination hereafter to carry her quarry. This lesson is to be continued till the falcon feeds very boldly on the lure on the ground, in the falconer's presence—till she will suffer him to walk round her while she is feeding. All this time she will have been held by the leash only, but in the next step a strong, but light creance must be made fast to the leash, and an assistant holding the hawk should unhood her, as the falconer, standing at a distance of 5 to 10 yds., calls her by shouting and casting out the lure. Gradually day after day the distance is increased, till the hawk will come 30 yds., or so without hesitation; then she may be trusted to fly to the lure at liberty, and by degrees from any distance, say 1000 yds. This accomplished, she should learn to stoop at the lure. Instead of allowing the hawk to seize upon it as she comes up, the falconer should snatch the lure away and let her pass by, and immediately put it out that she may readily seize it when she turns round to look for it. This should be done at first only once, and then progressively until she will stoop backwards and forwards at the lure as often as desired. Next she should be entered at her quarry. Should she be intended for rooks or herons, two or three of these birds should be procured. One should be given her from the hand, then one should be released close to her, and a third at a considerable distance. If she take these keenly, she may be flown at a wild bird. Care must, however, be taken to
let her have every possible advantage in her first flights—wind and weather, and the position of the quarry with regard to the surrounding country, must be considered.

Young hawks, on being received by the falconer before they can fly, must be put into a sheltered place, such as an outhouse or shed. Their basket or hamper should be filled with straw. A hamper is best, with the lid so placed as to form a platform for the young hawks to come out upon to feed. This should be fastened to a beam or prop a few feet from the ground. The young hawks must be most plentifully fed on the best fresh food obtainable—good beefsteak and fresh-killed birds; the falconer when feeding them should see his voice as in hearing. As soon as old enough they will come out, and perch about the roof of their shed, by degrees extending their flights to neighbouring buildings or trees, never failing to come at feeding time to the place where they are fed. Soon they will be continually on the wing, playing or fighting with one another, and later the falconer will observe them chasing other birds, as pigeons and rooks, which may be passing by. As soon as one fails to come for a meal, it must be at once caught with a bow net or a snare the first time it comes back, or it will be lost. It must be borne in mind that the longer hawks can be left at hack the better they are, so soon as the hawks are on the ground, the best which have prevailed a few times for themselves before being caught. Of course there is great risk of losing hawks when they begin to prey for themselves. When a hawk is so caught she is said to be "taken up" from hack. She will not require a ruder hood, but a good deal of the management described for the passage falcon will be necessary. She must be carefully tamed and broken to the hood in the same manner, and so taught to know the lure; but, as might be expected, very much less difficulty will be experienced. As soon as the eyas knows the lure sufficiently well to come to it sharp and straight from a distance, she must be taught to "wait on." This is effected by letting the hawk loose in an open place, such as a down. It will be found that she will circle round the falconer looking for the lure she has been accustomed to see—perhaps mount a little in the air, and advantage must be taken of a favourable moment when the hawk is at a little height, her head being turned in towards the falconer, to let go a pigeon which she can easily catch. When the hawk has taken two or three pigeons in this way, and mounts immediately in expectation, in short, begins to wait on, she should see no more pigeons, but be tried at game as soon as possible. Young pigeons should be flown as grouse first in preference to partridges, not only because the season commences earlier, but because, grouse being the heavier birds, they are not so much tempted to "carry" as with partridges.

The training of the great northern falcons, as well as that of merlins and hobbies, is conducted much on the above principles, but the jerfalcons (gerfalcons or gyrfalcons) will seldom wait on, and merlins will not do it at all.

The training of short-winged hawks is a simpler process. These must, like falcons, be provided with jesses, swivel, leash and bell. In these hawks a bell is sometimes fastened to the tail. Sparrow-hawks can, however, scarcely carry a bell big enough to be of any service. The hood is seldom used for short-winged hawks—never in the field. They must be made as tame as possible by carriage on the fist and the society of man, and taught to come to the fist freely when required—at first to jump to it in a room, and then out of doors. When the goshawk comes freely and without hesitation from short distances, she ought to be called from long distances from the hand of an assistant, but not oftener than twice in each meal, until she will come at least 1000 yds., on each occasion being well rewarded with some food she likes very much, as a fresh-killed bird, warm. When she does this freely, and endures the presence of strangers, dogs, &c., a few bagged rabbits should be given to her, and she will be ready to take the field. Some accustom the goshawk to the use of the lure, for the purpose of taking her if she will not come to the fist in the field when she has taken stand in a tree after being baulked of her quarry, but it ought not to be necessary to use it.

Falcons or long-winged hawks are either "flown out of the hood," i.e. unhooded and slipped when the quarry is in sight, or they are made to "wait on" till game is flushed. Herons and rooks are always taken by the former method. Passage hawks are generally employed for flying at these birds, though sometimes good eyases are quite equal to the work. For heron-hawking a well-stocked heronry is in the first place necessary. Next an open country which can be ridden over—which herons are in the constant habit of passing to and from their heronry on their fishing excursions, or making their "passage." A heron found at his feeding-place at a brook or pond affords no sure indication that a young heron will come. The young heron will go straight at him soon after he rises. It is sometimes advisable to fly a young falcon at a heron so found, but it should not be repeated. If there be much water the heron will neither show sport nor be captured. It is quite a different affair when he is sighted winging his way at a height in the air over an open tract of country free from water. Though he has no chance whatever of competing with a falcon in straight-forward flight, the heron has large concave wings, a very light body proportionately, and air-cells in his bones, and can rise with astonishing rapidity, more perpendicularly, or, in other words, as though he had wings, as it is sometimes said the heron can fly. As soon as he sees the approach of the falcon, which he usually does almost directly she is cast off, he makes play for the upper regions. Then the falcon commences to climb too to get above him, but in a very different style. She makes very large circles or rings, travelling at a high rate of speed, due to her strength and weight and power of flying, till she rises above the heron. Then she makes her attack by stooping with great force at the quarry, sometimes falling so far below it as the blow is evaded that she cannot spring up to the proper pitch for the next stoop, and has to make another ring to regain her lost command over the heron, which is ever rising, and so on—the "field" meanwhile gallowing down wind in the direction the flight is taking till she seizes the heron aloft, "binds" to him, and both come down together. Absurd stories have been told and pictures drawn of the heron receiving the falcon on its beak in the air. It is, however, well known to all practical falconers that the heron has no power or inclination to fight with a falcon in the air; so long as he is flying he seeks safety solely from his wings. When on the ground, however, should the falcon be deficient in skill or strength, or have been mutilated by the coping of her beak and talons, as was sometimes formerly done. Herons, if allowed to save the heron's life, the heron may use his dagger-like bill with dangerous effect, though it is very rare for a falcon to be injured. It is never safe to fly the goshawk at a heron of any description. Short-winged hawks do not immediately kill their quarry as falcons do, nor do they seem to know where the life lies, and seldom shift their hold once taken even to defend themselves; and they are therefore easily stabbed by a heron. Rooks are flown in the same manner as herons, but the flight is generally inferior. Although rooks fly very well, they seek shelter in trees or bushes as soon as possible.

For game-hawking eyases are generally used, though undoubtedly passage or wild-caught hawks are to be preferred. The best game hawks we have seen have been passage hawks, but there are difficulties attending the use of them. It may perhaps be fairly said that it is easy to make all passage hawks "wait on" in grand style, but until they have got over a season or two they are very liable to be lost. Among the advantages attending the use of eyases are the following: they are easier to obtain and to train and keep; they also moul t far better and quicker than passage hawks, while if lost in the field they will often go home by themselves, or remain about the spot where they were liberated. Experience, and, we must add, some good fortune also, are requisite to make eyases good for waiting on for game. Slight mistakes on the part of the falconer, false points from dogs, or bad luck in serving, will cause a young hawk to acquire bad habits, such as sitting down on the ground, taking stand in a tree, taking out wide, skimming the ground, or lazily flying about at no height. A good game hawk in proper
flying order goes up at once to a good pitch in the air—the higher she flies the better—and follows her master from field to field, always ready for a stoop when the quarry is spawning. Hawks that have been successfully broken and judiciously worked become wonderfully clever, and soon learn to regulate their flight by the movements of their master. Eyases were not held in esteem by the old falconers, and it is evident from their writings that these hawks have been very much better understood and managed in the 19th century than in the middle ages. It is probable that the old falconers procured their passage and wild-caught hawks with such facility, having at the same time more scope for their use in days when quarry was more abundant and there was more waste land than there now is, that they did not feel it necessary to trouble themselves about eyases. Here may be quoted a few lines from one of the best of the old writers, which may be taken as giving a fair account of the estimation in which eyases were generally held, and from which it is evident that the old falconers did not understand flying hawks at all. Simon Latham, writing in 1633, says of eyases:

"They will be more easily familiarised with the man, not in the house only, but also abroad, hooded or unhooded; nay, making a man's acquaintance when unhooded, and working away from his face. Whereas they are (as all falconers do find) a great deal more ready and familiar with a man when hooded, for if a man do starre or speake in their hearing, they will cry and bate as though they did desire to see the man. Likewise some of them being unhooded they will make a man cowre and crye, showing thereby their exceeding fondness and fawning love towards him..."

These kind of hawks are all (for the most part) taken out of the field, young, and from whence, from whence they are put into a close house, whereas they are always fed and familiarly brought up by the man, until they bee able to fly, when as the summer approaching very suddenly they are continued and trained up in the same, the weather being always warm and temperate; thus are they still inured to familiarity with the man, not knowing from whence besides to fetch their relief or sustenance. When the summer is ended they bee commonly put up into a house again, or else kept in some warm place, for they cannot endure the cold wind to blow upon them... But leaving to speak of these kind of scratching hawks that I never did love should come too near my fingers, and to return unto the faire conditioned haggard faulcon...

The author here describes with accuracy the condition of untrained eyases, which no modern falconer would trouble himself to keep. Many English falconers in modern times have eyases which have killed grouse, ducks and other quarry in a style almost equaling that of passage hawks. Rooks also have been most successfully flown, and some herons on passage have been taken by eyases. No sport is to be had at game without hawks that wait on well, Mores, downs, open country where the hedges are low and weak are best suited to game hawks. Pigeons, Partridges, or Turkeys might be used to find game, or the hawk may be let on coming to the ground where game is known to lie, and suffered, if an experienced one, to "wait on" till game is flushed. However, the best plan with most hawks, young ones especially, is to use a dog, and to let the hawk go when the dog points, and to flush the birds as soon as the hawk is at her pitch. It is not by any means necessary that the hawk should be near the birds when they rise, provided she is at a good height, and that she is watching; she will come at once with a rush out of the air at great speed, and either cut one down with the stoop, or the hawk willロー herself by putting, when every exertion must be made, especially if the hawk be young and inexperienced, to "serve" her as soon as possible by driving out the bird again while she waits overhead. If this be successfully done she is nearly certain to kill it at the second flight. Perhaps falcons are best for grouse and tiercels for partridges.

Magpies afford much sport. Only tiercels should be used for hunting magpies. A field is necessary—at the very least 4 or 5 runners to beat the magpie out, and perhaps the presence of a horseman is an advantage. Of course in open flight a magpie would be almost immediately caught by a tiercel peregrine, and there would be no sport, but the magpie makes up for his want of power of wing by his cunning and shiftiness; and he is, moreover, never to be found except where he has shelter under his lee for security from a passing peregrine. Once in a hedge or tree he is perfectly safe from the wild falcon, but the case is otherwise when the falconer approaches with his trained tiercel, perhaps a cast of tiercels, waiting on in the air, with some active runners in his field. Then driven from hedge to hedge, from one kind of shelter to another, stopped at every instant when he shows himself ever so little away from cover by the watchful tiercels overhead, his egg-steealing days are brought to an end by a fatal stroke—sometimes not before the field is pretty well exhausted with running and shouting. The magpie always manoeuvres towards some thick wood, from which it is the aim of the field to cut him off. At first hawks must be flown in easy country, but when they understand their work well they will kill magpies in very enclosed country—with a smart active field a magpie may even be pushed through a small wood. Magpie hunting affords excellent exercise, not only for those who run to serve the hawks, but for the hawks also; they get a great deal of flying, and learn to hunt in company with men—any number of people may be present. Blackbirds may be hunted with tiercels in the same way. Woodcock afford capital sport where the country is tolerably open. It will generally be found that after a hawk has made one stoop at a woodcock, the cock will at first try to escape by taking the air, and will show a very fine flight. When beaten in the air it will try to get back to covert again, but when once a hawk has out flown a woodcock, he is pretty sure to kill it. Hawks seem to pursue woodcocks with great keenness; something in the flight of the cock tempts them to exertion. The laziest and most useless hawks—haws that will scarcely follow a slow pigeon—will do their best at woodcock, and will very soon, if the sport is continued, be improved in their style of flying. Snipe may be killed by first-class tiercels in favourable localities. Wild duck and teal are only to be flown at when they can be found in small pools or brooks at a distance from much water—where the fowl can be suddenly flushed by men or dogs while the falcon is flying at her pitch overhead. For duck, falcons should be used; tiercels will kill too capital a sport.

The merlin is used for flying at larks, and there does not seem to be any other use to which this pretty little falcon may fairly be put. It is very active, but far from being, as some authors have stated, the swiftest of all hawks. Its flight is greatly inferior in speed and power to that of the peregrine. Perhaps its diminutive size, causing it to be soon lost to view, and a limited acquaintance with the flight of the wild peregrine falcon, have led to the mistake.

The hobby is far swifter than the merlin, but cannot be said to be efficient in the field; it may be trained to wait on beauti-

FALCONRY

...
they are brought in the East. In India, for instance, there is a far greater variety of quarry suited to them, and wild hawks not much more approachable; moreover, there are advantages for training birds which do not exist in England. Unmoled and scarcely noticed except perhaps by others of his calling or tastes—

the Eastern falconer carries his hawk by day and night in the crowded bazaars, till the bird becomes perfectly indifferent to men, horses, dogs, carriages, and, in short, becomes as tame as the domestic animals.

The management of sparrow-hawks is much the same as that of goshawks, but they are far more delicate than the latter. They are flown in England at blackbirds, thrushes and other small birds; good ones will take a live bird in hand till they get too wild, and strange with the advancing season. In the East, large numbers of quail are taken with sparrow-hawks.

It is of course important that hawks from which work in the field is expected should be kept in the highest health, and they must be carefully fed; no bad or tainted meat must on any account be given to them—at any rate to hawks of the species used in England. Peregrines and the great northern falcons are best kept on beefsteak, with a frequent change in the shape of fresh-killed pigeons and other birds. The smaller falcons, the merlin and the hobby, require more of this liberal feeding to keep them in a good health for any length of time. Goshawks should be fed like peregrines, but rats and rabbits are very good as change of food for them. The sparrow-hawk, like the smaller falcons, requires small birds. All hawks require castings frequently. It is true that hawks will exist, and often appear to thrive, on good food without castings, but the seeds of probable injury to their health are being sown the whole time they are so kept. If there is difficulty in procuring birds, and it is more convenient to feed the hawks on beefsteak, they should frequently get the wings and heads and necks of game and poultry. In addition to the castings which they swallow, treading these is a good exercise for them, and biting the bones prevents the beaks from overgrowing. Most hawks, peregrines especially, require the bath. The end of a cask, sawn off to give a depth of about 6 in., makes a very good bath. Peregrines which are used for waiting on require a bath at least twice a week. If this be neglected, they will not wait long before going off in search of water to bathe, however hungry they may be.

The most agreeable and the best way, where practicable, of keeping hawks is to have them on blocks on the lawn. Each hawk's block should stand in a circle of grass at least 10 ft. in diameter, with nothing but patch grass between the edge of the shed, the floor of which should be laid with sand to a depth of 3 or 4 in. Merlins and hobbies are too tender to be kept much out of doors. An eastern aspect is to be preferred—all birds enjoy the morning sun, and it is very beneficial to them. The more hawks confined to blocks out of doors see of persons, dogs, horses, &c., moving about the better, but of course only when there is no danger of their being frightened or molested, or of food being given to them by strangers. Those who have only seen wretched ill-fed hawks in cages as in zoological gardens or menageries, pining for exercise, with battered plumage, torn shoulders and bleeding ears, from dashing against their prison bars, and overgrown beaks from never getting bones to break, can have little idea of the beautiful and striking-looking birds that can be seen pluming their feathers and stretching their wings at their ease at their blocks on the falconer's lawn, watching with their large bright keen eyes everything that moves in the sky and everywhere else within the limits of their view. Contrary to the prevailing notion, hawks show a good deal of attachment when they have been properly handled. It is true that by hunger they are in a great measure tamed and controlled, and the same may be said of all undomesticated and many domesticated animals. And instinct prompts all wild creatures when away from man's control to return to their former shyness, but hawks certainly retain their tameness for a long time, and their memory is remarkably retentive. Wild-caught hawks have been taken, either by their coming to the lure or upon quarry, from 2 to 7 days after they had been lost, and eyases after 3 weeks. As one instance of retentiveness of memory displayed by hawks we may mention the case of a wild-caught falcon which took till he became in love with the lure, and in this way took till he became in love with the lure, and in this way

was released; in five days she was flying at the lure again at liberty, and was found to retain the peculiar ways and habits she was observed to have in her former existence as a trained hawk. It is useless to bring a hawk into the field unless she has a keen appetite; if she has not, she will neither hunt effectually nor follow her master. Even wild-caught falcons, however, may sometimes be seen so attached to their owner that, when sitting on their blocks on a lawn in their crops, they will not budge as long as he is within reach. If he goes away, they either go up to them and allow him to jump to his hand or withdraw from their sight. Goshawks are also known to evince attachment to their owner. Another prevailing error regarding hawks is that they are supposed to be lazy birds, requiring the stimulus of hunger to stir them to action. The reverse is the truth; they are birds of very active habits, and exceedingly restless, and the notion of their being lazy has been propagated by those who have seen little or nothing of hawks in their wild state. The wild falcon requires an immense deal of exercise, and to be in wind, in order to exert the speed and power of flight necessary to capture her prey when hungry; and to this end instinct prompts her to spend hours daily on the wing, soaring and playing about in the air in all weathers, often chasing birds merely for play or exercise. Sometimes she takes a siesta when much gorged, but unless she fills her crop late in the evening she is soon moving again—before half her crop is put over. Goshawks and sparrow-hawks, too, habitually soar in the air at about 9 or 10 A.M., and remain aloft a considerable time, but these birds are not of such active habits as the falcons. The frequent batting of thoroughly tame hawks from their bars is enough to make them not hungry or frightened, proves their restlessness and impatience of repose. So does the wretched condition of the caged falcon (before alluded to), while the really lazy buzzards and kites, which do not in a wild state depend on activity or power of wing for their sustenance, maintain themselves for years, even during confinement if properly fed, in good case and plumage. Such being the habits of the falcon in a state of nature, the falconer should endeavour to give the hawks under his care as much flying as possible, and he should avoid the very common mistake of keeping too many hawks. In this case a favoured few are sure to get all the work, and the others, possibly equally good if they had fair play, are spoiled for want of exercise.

The larger hawks may be kept in health and working order for several years—15 or 20—haring accidents. The writer has known peregrines, shaheens and goshawks to reach ages between 15 and 20 years. Goshawks, however, never fly well after 4 or 5 seasons, when they will no longer take difficult quarry; they may be used at rabbits as long as they live. Shaheens may be seen in the East at an advanced age, killing wild-fowl beautifully. The shaheen is a falcon of the peregrine type, which does not travel, like the peregrine, all over the world. It is supposed that the jerfalcons also may be worked to a good age. Old Simon Latham tells us of these birds—"I myself have known one of them an excellent Hearnor (killer of herons), and to continue her goodnesse very near twenty yeeres, or full out that time."

AUTHORITIES.—Schlegel's Traité de fauconnerie contains a very large list of works on falconry in the languages of all the principal countries of the Old World. Bibliotheca accipitraria, by J. E.
Harting (1891), gives a complete bibliography. See Coursing and Falconry in the Badminton Library; and The Art and Practice of Falconry, by E. B. Michell (1906), the best modern book on the subject. Perhaps the most useful of the old works are The Book of Faulconerie or Hawking, by George Turberville (1578), and The Faulcon's Lure and Core, by Simon Latham (1633). (E. D. R.)

FALDSTOOL (from the O.H. Ger. falden or fallen, to fold, and Inreal, Mod. Ger. Stuhl, a stool; from the medieval Latin faldstolium is derived, through the old form fandaestuol, the Mod. Fr. fautilld, properly a folding seat for the use of a bishop when not occupying the throne in his own cathedral, or when officiating in a cathedral or church other than his own; hence any movable folding stool used for kneeling in divine service. The small desk or stand from which the Litany is read is sometimes called a faldstool, and a similar stool is provided for the use of the sovereign at his coronation.

FALERII [m. Civitã Castellana (q.e.), one of the twelve chief cities of Etruria, situated about 1 m. W. of the ancient Via Flaminia,1 32 m. N. of Rome. According to the legend, it was of Argive origin; and Strabo's assertion that the population, the Falisci (q.e.), were of a different race from the Etruscans is proved by the language of the earliest inscriptions which have been found here. Wars between Rome and the Falisci appear to have been frequent. To one of the first of them belongs the story of the schoolmaster who wished to betray his boys to Camillus; the latter refused his offer, and the theocracy surrendered the city, after the First Punic War, to the Falisci in rebellion, but were soon conquered (241 B.C.) and lost half their territory. Zonaras (viii. 18) tells us that the ancient city, built upon a precipitous hill, was destroyed and another built on a more accessible site on the plain. The description of the two sites agree well with the usual theory that the original city occupied the site of the present Civitã Castellana, and that the ruins of Faleri (as the place is now called) are those of the Roman town which was thus transferred 3 m. to the north-west. After this time Faleri hardly appears in history. It became a colony (Junonia Faliscia), perhaps under Augustus, though according to the inscriptions apparently not until the time of Gallienus. There were bishops of Faleri up till 1033, when the desertion of the place in favour of the present site began, and the last mention of it dates from A.D. 1064.

The site of the original Faleri is a plateau, about 1100 yds. by 400, not higher than the surrounding country (475 ft.) but separated from it by gorges over 200 ft. in depth, and only connected with it on the western side, which was strongly fortified with a mound and ditch; the rest of the city was defended by walls constructed of rectangular blocks of stone, of which some remains still exist. Remains of a temple were found at Lo Scasato, at the highest point of the ancient town, in 1888, and others have been excavated in the outskirts. The attribution of one of these to Juno Quiritis is uncertain. These buildings were of wood, with fine decorations of coloured terracotta (Notizie degli scavi, 1887, p. 92; 1888, p. 474). Numerous tombs hewn in the rock are visible on all sides of the town, and important discoveries have been made in them; many objects, both from the temples and from the tombs, are in the Museo di Villa Giulia at Rome. Similar finds have been made in the inhabited valley, and the whole site, over 200 by 120 yds., is a square. The site of the Roman Faleri is now entirely abandoned. It lay upon a road which may have been (see H. Nissen, Italice Landskunde, ii. 361) the Via Annia, a by-road of the Via Cassia; this road approached it from the south passing through Nepet, while its prolongation to the north certainly bore the name Via Amerina. The circuit of the city is about 2250 yds., its shape roughly triangular, and the walls are a remarkably fine and well-preserved specimen of Roman military architecture. They are constructed of rectangular blocks of tufa two Roman ft. in height; the walls themselves reach in places a height of 56 ft. and are 7 to 9 ft. thick. There were about 80 towers, some 50 of which are still preserved, also an old double wall of eight, are noteworthy. Of the buildings within the walls hardly anything is preserved above ground, though the forum and theatre (as also the amphitheatre, the arena of which measured 180 by 208 ft. outside the walls) were all excavated in the 19th century. Almost the only edifice now standing is the 12th-century abbey church of S. Maria. Recent excavations have shown that the plan of the whole city could easily be recovered, though the buildings have suffered considerable devastation (Notaie degli scavi, 1903, 14).

FALERIO (mod. Falerone), an ancient town of Picenum, Italy, about 10 m. S.E. of Urbis Salvia. We know almost nothing of the place except from inscriptions, from which, and from the remains of its buildings, it appears to have been of some importance. It was probably founded as a colony by Augustus after his victory at Actium. A question arose in the time of Domitian between the inhabitants of Faleria and Firma as to land which had been taken out of the territory of the latter (which was colonized by the triumvirs), and, though not distributed to the new settlers, had not been given back again to the people of Firma. The emperor, by a rescript, a copy of which in bronze was found at Falero, decided in favour of the people of Faleria, that the occupiers of this land should remain in possession of it (Th. Mommsen in Corp. Inscrip. Latin. ix., Berlin, 1883, No. 5, 420). Considerable remains of a theatre in concrete faced with brickwork, erected, according to an inscription, in 43 B.C., and 160 ft. in diameter, were excavated in 1838 and are still visible; and an amphitheatre, less well preserved, also exists, the arena of which measures about 180 by 150 ft. Between the two is a water reservoir (called Bagno della Regina) connected with remains of baths.

G. de Minicis in Giornale Arcadico, iv. (1832), 150 seq.; Annotati dell’Istituto (1839), 5 seq.

FALGUIÈRE, JEAN ALEXANDRE JOSEPH (1831–1900), French sculptor and painter, was born at Toulouse. A pupil of the Ecole des Beaux Arts he won the Prix de Rome in 1859; he was awarded the medal of honour at the Salon in 1868 and was appointed officer of the Legion of Honour in 1878. His first bronze statue of importance was the “Victor of the Cock-Fight” (1864), and “Tarsius the Christian Boy-Martyr” followed in 1867; both are now in the Luxembourg Museum. His more important monuments are those to Admiral Courbet (1890) at Abbeville and the famous “Joan of Arc.” Among more ideal works are “L' Eve” (1880) and “The Peacock,” and “The Poet,” astride his Pegasus spreading wings for flight. His “Triumph of the Republic” (1881–1886), a vast quadriga for the Arc de Triomphe, Paris, is perhaps more amazingly full of life than others of his works, all of which reveal this quality of vitality in superlative degree. To these works should be added his monuments to “Cardinal Lavigerie” and “General de La Fayette” (the latter in Washington), and his statues of “Lamartine” (1876) and “St Vincent de Paul” (1879), as well as the “Balzac,” which he executed for the Société des gens de lettres on the rejection of that by Rodin, and the busts of “Carus-Duran” and “QuENUET’s cadet” (1896).

Falguière was a painter as well as a sculptor, but somewhat inferior in merit. He displays a fine sense of colour and tone, added to the qualities of life and vigour that he instills into his plastic work. His “Wrestlers” (1872) and “Fan and Dagger” (1882; a defiant Spanish woman) are in the Luxembourg, and other pictures of importance are “The Beheading of St John the Baptist” (1877), “The Sphinx” (1883), “Aca and Galatea” (1885), “Old Woman and Child” (1886) and “In the Bull Staircase” (1890). He was a member of the Institute (Académie des Beaux-Arts) in 1882. He died in 1900.

See Léonce Bénédite, Alexandre Falguière, Librairie de l’art (Paris).
FALIERO—FALK

FALIERO (or FALIER), MARINO (1279–1355), doge of Venice, belonged to one of the oldest and most illustrious Venetian families and had served the republic with distinction in various capacities. In 1346 he commanded the Venetian land forces at the siege of Zara, where he was attacked by the Hungarians under King Louis the Great and totally defeated; this victory led to the surrender of the city. In September 1354, while absent on a mission to Pope Innocent IV. at Avignon, Faliero was elected doge, an honour which apparently he had not sought. His reign began, as it was to end, in disaster, for very soon after his election the Venetian fleet was completely destroyed by the Genoese off the island of Sapienza, while plague and a declining commerce aggravated the situation. Although a capable commander and a good statesman, Faliero possessed a violent temper, and after his election developed great ambition. The constitutional restrictions of the ducal power, which had been furthered during his lifetime, were now proceeded against. In 1355 the nobility, by a violent act, placed armed guards all over the town. Several of the conspirators were condemned to death and others to various terms of imprisonment. The doge’s complicity having been discovered, he was himself arrested; at the trial he confessed everything and was condemned and executed on the 17th of April 1355.

The story of the insult written by Michele Steno on the doge’s chair is a legend of which no record is found in any contemporary authority. The motives of Faliero are not altogether clear, as his past record, even in the judgment of the poet Petrarch, showed him as a wise, clear-headed man of no unwonted passion. But possibly the attitude of the aristocracy and the example offered by the tyrants of neighbouring cities may have induced him to attempt a similar policy. The only result of the plot was to consolidate the power of the Council of Ten.

BIBLIOGRAPHY.—An account of Marino Faliero’s reign is given in S. Romani’s Storia documentata di Venezia, lib. ix. cap. ii. (Venice, 1828); C. Santad. La vita di Faliero, the edition of F. C. Santad. (Venice, 1883); G. d’Avanzo, Le opere di Faliero in edizione di E. R. (Città di Castello, 1900). For special works see V. Lazzarini’s Geografia d. M. Faliero in the Archivio Veneto of 1892; “M. Faliero” in Vol. iii. of F. d’Avanzo’s Italia antica, ib. (1893), and his exhaustive study “M. Faliero, la Congiura,” ibd. (1897). The most recent essay on the subject is contained in Horatio Brown’s Studies in Venetian History (London, 1907), wherein all the authorities are set forth. (L. V. F.)

PALISCI, a tribe of Sabine origin or connexions, but speaking a dialect closely akin to Latin, and of the illustrious stock of Falerii (g.), as well as a considerable tract of the surrounding country, probably reaching as far south as to include the small town of Capena. But at the beginning of the historical period, i.e. from the beginning of the 5th century B.C. and no doubt earlier, the dominant element in the town was Etruscan; and all through the wars of the following centuries the town was counted a member, and sometimes a leading member, of the Etruscan league (cf. Livy iv. 23, v. 17, vii. 17).

In spite of the Etruscan domination, the Faliscans preserved many traces of their Italian origin, such as the worship of the deities Juno Quiritis (Ovid, Fasti, vi. 49) and Feronia (Livy xxv. 11), the cult of Dis Sironus by the Hirpì or fire-leaping priests on Mount Soracte (Pliny, Nat. Hist. vii. 2, 19; Servius, ad Aen. xi. 785, 787), above all their language. This is preserved for us in some 36 short inscriptions, dating from the 3rd and 2nd centuries B.C., and is written in a peculiar alphabet derived from the Etruscan, and written from right to left, but showing some traces of the influence of the Latin alphabet. Its most characteristic signs are—

As a specimen of the dialect may be quoted the words written round the edge of a picture on a patera, the genuineness of which is established by the fact that they were written before the glaze was put on: “foi edo vino pipafo, cra carefo,” i.e. in Latin “hodie vinum bibam, cris carbo” (R. S. Conway, Italic Dialects, p. 352). This shows some of the phonetic characteristics of the Faliscan dialect, viz.,

1. The retention of medial f which in Latin became b;
2. The representation of an initial Ind.-Eur. gh by f (fond, contrast Latin hodie);
3. The palatalization of d- consonant i into some sound denoted by n, the central sound of fon, from fond;
4. The loss of final s, at all events before certain following sounds (e.g. beside Latin cras);
5. Other characteristics, appearing elsewhere, are:
   a. The retention of the velars (Fal. quando = Latin quando; contrast Umbrian pan(n)u);  
   b. The assimilation of some final consonants to the initial letter of the next word: "prætor de senatu sententia" (Conway, ib. cit. 321), i.e. "prætor of the Senate";
   c. Other characteristics, appearing elsewhere, are:
      a. The retention of the velars (Fal. quando = Latin quando; contrast Umbrian pan(n)u);  
      b. The assimilation of some final consonants to the initial letter of the next word: "prætor de senatu sententia" (Conway, ib. cit. 321), i.e. "prætor of the Senate";
      c. Other characteristics, appearing elsewhere, are:

Further information may be sought from W. Deebke, Die Faliser (a useful but somewhat uncritical collection of the evidence accessible in 1888); E. Bornmann, in C.I.L. xi. pp. 465 ff., and Conway, op. cit. (R. S. C.)

FALK, JOHANN DANIEL (1768–1826), German author and philanthropist, was born at Danzig on the 28th of October 1768. After attending the gymnasium of his native town, he entered the university of Halle with the view of studying theology, but preferring a non-professional life, gave up his theological studies and went to live at Weimar. There he published a volume of satires, which exerted a beneficial influence on the character of Wieland, and brought him admission into literary circles. After the battle of Jena, Falk, on the recommendation of Wieland, was appointed to a civil post under the French official authorities and rendered his townsman such good service that the duke of Weimar created him a councillor of legislation. In 1813 he established a society for friends in need (Gesellschaft der Freunde in der Not), and about the same time founded an institute for the care and education of neglected and orphan children, which, in 1830, was taken over by the state and still exists as the Falkisches Institut. The first literary efforts of Falk took the form chiefly of satirical poetry, and gave promise of greater future excellence than was ever completely fulfilled; his later pieces, directed more against individuals than the general vices and defects of society, gradually degenerated in quality. In 1806 Falk founded a critical journal under the title of Elysium und Tartarus. He also contributed largely to contemporary journals. He enjoyed the acquaintance and intimate friendship of Goethe, and his account of their intercourse was posthumously published under the title Goethe aus näheren persönlichen Umgange dargestellt (1832) (English by S. Austin). Falk died on the 14th of February 1826.

Falk’s Satirische Werke appeared in 7 vols. (1817 and 1826); his Abhandlungen Schriften (5 vols., 1819). See Johannes Falk; Erinnerungsbilder aus Briefen und Tagebüchern, gesammelt von dessen Tochter Rosalie Falk (1868); Heinzelmann, Johannes Falk und die Gesellschaft der Freunde in der Not (1879); A. Stein, J. Falk (1881); Hultzsch, Falk und Goethe (1900).
FALK, PAUL LUDWIG ADALBERT (1827-1900), German politician, was born at Matschkau, Silesia, on the 10th of August 1827. In 1847 he entered the Prussian state service, and in 1853 became public prosecutor at Lyck. In 1858 he was elected a deputy, joining the Old Liberal party. In 1868 he became a privy-councillor in the ministry of justice. In 1872 he was made minister of education, and in connexion with Bismarck's policy of the Kultur-kampf he was responsible for the famous May Laws against the Catholics (see GERMANY: HISTORY). In 1882 his position became untenable, owing to the death of Pius IX., and the change of German policy with regard to the Vatican, and he resigned his office, but retained his seat in the Reichstag till 1882. He was then made president of the supreme court of justice at Hamm, where he died in 1900.

FALKE, JOHANN FRIEDRICH GOTTLIEB (1823-1876), German historian, was born at Ratzeburg on the 29th of April 1823. Entering the university of Erlangen in 1843, he soon began to devote his attention to the history of the German language and literature, and in 1848 went to Munich, where he resided five years, and diligently availed himself of the use of the government library for the purpose of prosecuting his historical studies. In 1856 he was appointed secretary of the German museum at Nuremberg, and in 1859 keeper of the manuscripts. With the aid of the manuscript collections in the museum he now turned his attention chiefly to political history, and, with Johann H. Müller, established an historical journal under the name of Zeitschrift für deutsche Kulturgeschichte (4 vols., Nuremberg, 1856–1859). To this journal he contributed a history of German taxation and commerce. On the latter subject he published separately Geschichte des deutschen Handels (2 vols., Leipzig, 1859–1860) and Die Hanse als deutsche See-und Handelsmacht (Berlin, 1862). In 1892 he was appointed secretary of the state archives at Dresden, and, a little later, keeper. He there began the study of Saxon history, still devoting his attention chiefly to the history of commerce and economy, and published Die Geschichte des Kürfürsten August von Sachsen in volks-wirtschaftlicher Beziehung (Leipzig, 1868) and Geschichte des deutschen Zollwesens (Leipzig, 1869). He died at Dresden on the 2nd of March 1876.

FALKIRK, a municipal and police burgh of Stirlingshire, Scotland, Pop. (1801) 16,769; (1901) 29,280. It is situated on high ground overlooking the fertile Carse of Falkirk, 11 m. S.E. of Stirling, and about midway between Edinburgh and Glasgow. Grangemouth, its port, lies 3 m. to the N.E., and the Forth & Clyde Canal passes to the north, and the Union Canal to the south of the town. Falkirk now comprises the suburbs of Laurieston (E.), Grahamston and Bainsford (N.), and Camelon (W.). The principal structures include the burgh and county buildings, town hall, the Dollar free library and Camelon fever hospital. The present church, with a steeple 146 ft. high, dates only from 1811. In the churchyard are buried Sir John Graham, Sir John Stewart who fell in the battle of Flodden, and Sir Robert Munro and his brother, Dr Duncan Munro, killed in the battle of Flodden. The town is under the control of a council with provost and bailies, and combines with Airdrie, Hamilton, Lanark and Linlithgow (the Falkirk group of burghs) to return a member to parliament. The district is rich in coal and iron, which supply the predominant industries, Falkirk being the chief seat of the light casting trade in Scotland; but tanning, flour-milling, brewing, distilling and the manufacture of explosives (Nobel's) and chemicals are also carried on. Trysts or sales of cattle, sheep and horses were once held on the third week of August (September and October) on Stenhousemuir, 3 m. N.W. They were transferred thither from Crief in 1770, and were formerly the most important in the kingdom, but have now been greatly extended by the local weekly auction marts. Carron, 2 m. N.N.W., is famous for the iron-works established in 1760 by Dr John Roebuck (1718-1794), whose advising engineers were successively John Smeaton and James Watt. The short iron guns of large calibre designed by General Robert Melville, and first cast in 1779, were called carronades from this their place of manufacture.

Falkirk is a town of considerable antiquity. Its original name was the Gaelic Ebalis brea, "church of speckled or mottled stone," which Simeon of Durham (fl. 1130) transfigurated as Edgarsheth. By the end of the 13th century appears the form Faulkirk (the present local pronunciation), which is merely a translation of the Gaelic faur or faw, meaning "dun," "pale red." The first church was built by Malcolm Canmore (d. 1093). Falkirk was made a burgh of barony in 1600 and a burgh of regality in 1646, but on the forfeiture of the earl of Linlithgow in 1715 the statutory grant was vested in the crown. The town, immediately to the S., was the seat of the earl and his ancestors. The mansion was visited by Queen Mary, captured by Cromwell, and occupied by Generals Monk and Hawley. The wall of Antoninus ran through the grounds, and the district is rich in Roman remains, Camelon, about 2 m. W., being the site of a Roman settlement; Merchiston Hall, to the N.W., was the birthplace of Admiral Sir Charles Napier. The eastern suburb of Laurieston was first called Langtoun, then Merchiston, and received its present name after Sir Lawrence Dundas of Kerse, who had promoted its welfare. At Polmont, farther to the N., lies the former seat of the Duke of Hamilton, the school of Blair Lodge, besides coal-mines and other industries.

Battles of Falkirk.—The battle of the 22nd of July 1298 was fought between the forces of King Edward I. of England and those of the Scottish national party under Sir William Wallace. The latter, after long baffling the king's attempts to bring him to battle, had taken up a strong position south of the town behind a morass. They were formed in four deep and close masses ("schillrons") of pikemen, the light troops screening the front and a line of pikemen and -at-arms standing in reserve. It was perhaps hoped that the English cavalry would plunge into the morass, for no serious precautions were taken as to the flanks, but in any case Wallace desired no more than to receive an attack at the halt, trusting wholly to his massed pikes. The English right wing first appeared, tried the morass in vain, and then set out to turn it by a long détour; the main battle under the king halted in front of it, while the left wing under Antony Bec, bishop of Durham, was able to reach the head of the marsh without much delay. Once on the enemy's side of the obstacle, the bishop halted to wait for Edward, who was now following him, but his timid, stupid barons, shouting "Tit for that, thee bishop, to teach us war. Go say mass !" drove off the Scottish archers and men-at-arms and charged the nearest square of pikes, which repulsed them with heavy losses. On the other flank the right wing, its flank march completed, charged with the same result. But Edward, who had now joined the bishop with the centre or "main battle," peremptorily ordered the cavalry to stand fast, and, taught by his experience in the Welsh wars, brought up his archers. The longbow here scored its first victory in a pitched battle. Before long gaps appeared in the close ranks of pike heads, and after sufficient preparation Edward again launched his men-at-arms to the charge. The shaken masses then gave way one after the other, and the Scots fled in all directions.

The second battle of Falkirk, fought on the 17th of January 1746 between the Highlanders under Prince Charles and the British forces under General Hawley, resulted in the defeat of the latter. It is remarkable only for the bad conduct of the British dragoons and the steadiness of the infantry. Hawley retreated to Linlithgow, leaving all his baggage, 700 prisoners and seven guns in the enemy's hands.

FALKLAND, LUCIAN CARY, first Viscount (c. 1610-1643), son of Sir Henry Cary, afterwards 1st Viscount Falkland (d. 1633), a member of an ancient Devonshire family, who was lord deputy of Ireland from 1622 to 1629, and of Elizabeth (1585-1639), only daughter of Sir Lawrence Tanfield, chief baron of the exchequer, was born either in 1600 or 1610, and was educated at Trinity College, Dublin. In 1625 he inherited from his grandfather the manors of Great Tew and Burford in Oxfordshire, and, about the age of 21, married Lettice, daughter of Sir Richard Morrison, of Tooley Park in Leicestershire. Involved in a quarrel with his father, whom he failed to propitiate by
FALKLAND

offering to hand over to him his estate, he left England to take service in the Dutch army, but soon returned. In 1633, by the death of his father, he became Viscount Falkland. His mother had embraced the Roman Catholic faith, to which it was now sought to attract Falkland himself, but his studies and reflections led him, under the influence of Chillingworth, to the interpretation of religious problems rather by reason than by tradition or authority. At Great Tew he enjoyed a short but happy period of study, and he assembled round him many gifted and learned men, whom the near neighbourhood of the university and his own brilliant qualities attracted to his house. He was the friend of Hales and Chillingworth, was celebrated by Jonson, Suckling, Cowley and Waller in verse, and in prose by Clarendon, who is eloquent in describing the virtues and genius of the "incomparable" Falkland, and draws a delightful picture of his society and hospitality.

Falkland's intellectual pleasures, however, were soon interrupted by war and politics. He felt it his duty to take part on the king's side as a volunteer under Essex in the campaign of 1639 against the Scots. In 1640 he was returned for Newport in the Isle of Wight to the Short and Long Parliaments, and took an active part on the side of the opposition. He spoke against the exaction of shipmoney on the 7th of December 1640, denouncing the servile conduct of Lord Keeper Finch and the judges. He supported the prosecution of Strafford, at the same time endeavouring on more than one occasion to moderate the measures of the Commons in the interests of justice, and voted for the third reading of the attainder bill on the 21st of April 1641. On the 2nd of May the organization of the church he urged in the debate of the 8th of February 1641, that the interference of the clergy in secular matters, the encroachments in jurisdiction of the spiritual courts, and the imposition by authority of unnecessary ceremonies, should be prohibited. On the other hand, though he denied that episcopacy existed jure divino, he was opposed to its abolition; fearing the establishment of the Presbyterian system, which in Scotland had proved equally tyrannical. Triennial parliaments would be sufficient to control the bishops, if they mediated any further attacks upon the national liberties, and he urged that "where it is not necessary to change, it is necessary not to change." Even Hampden still believed that a compromise with the episcopal principle was possible, and assured Falkland that if the bill taken up to the Lords on the 1st of May 1641, excluding the bishops from the Lords and the clergy from secular offices, were passed, "there would be nothing more attempted to the prejudice of the church." Accordingly the bill was supported by Falkland. The times, however, were not favourable to compromise. The bill was lost in the Lords, and on the 27th of May the Root and Branch Bill, for the total abolition of episcopacy, was introduced in the House of Commons. This measure Falkland opposed, as well as the second bill for excluding the bishops, introduced on the 21st of October. In the discussion on the Grand Remonstrance he took the part of the bishops and the Arminians. He was now opposed to the whole policy of the opposition, and, being reproached by Hampden with his change of attitude, replied "that he had formerly been persuaded by that worthy gentleman to believe many things which he had since found to be untrue, and therefore he had changed his opinion in many particulars as well as to things as to persons."

On the 1st of January 1642, immediately before the attempted arrest of the five members, of which, however, he was not cognizant, he was offered by the king in taryship of state, and was persuaded by Hyde to accept it, thus becoming involved directly in the king's policy, though evidently possessing little influence in his counsels. He was one of the peers who signed the protestation against making war, at York on the 15th of June 1642. On the 5th of September he carried Charles's overtures for peace to the parliament, when he informed the leaders of the opposition that the king consented to a thorough reformation of religion. The secret correspondence connected with the Waller plot passed through his hands. He was present with the king at Edgehill and at the siege of Gloucester. By this time the hopelessness of the situation had completely overwhelmed him. The aims and principles of neither party in the conflict could satisfy a man of Falkland's high ideals and intellectual vision. His royalism could not suffer the substitution, as the controlling power in the state, of a parliament for the monarchy, nor his conservatism the revolutionary changes in church and state now insisted upon by the opposite factions. The noble character and policy of the king, the most incapable of men and yet the man upon whom all depended, must have been by now thoroughly understood by Falkland. Compromise had long been out of the question. The victory of either side could only bring misery; and the prolongation of the war was a prospect equally unhappy. Nor could Falkland find any support or consolation in his own inward convictions or principles. His ideals and hopes were now destroyed, and he had no definite political convictions such as inspired and strengthened Strafford and Pym. In fact his sensitive nature shrank from contact with the practical politics of the day and prevented his rise to the place of a leader or a statesman. Clarendon has recorded his final relapse into despair. "Sitting amongst his friends, often, after a deep silence and frequent sighs (he) would with a shrill and sad accent ingenerate the word Peace, Peace, and would passionately profess that the very agony of the war, and the view of the calamities and desolation the kingdom did and must endure, took his sleep from him and would shortly break his heart." At Gloucester he had in vain exposed himself to risks. On the morning of the battle of Newbury, on the 20th of September 1643, during the debate of the 8th of February 1641, that the interference of the clergy in secular matters, the encroachments in jurisdiction of the spiritual courts, and the imposition by authority of unnecessary ceremonies, should be prohibited. On the other hand, though he denied that episcopacy existed jure divino, he was opposed to its abolition; fearing the establishment of the Presbyterian system, which in Scotland had proved equally tyrannical. Triennial parliaments would be sufficient to control the bishops, if they mediated any further attacks upon the national liberties, and he urged that "where it is not necessary to change, it is necessary not to change." Even Hampden still believed that a compromise with the episcopal principle was possible, and assured Falkland that if the bill taken up to the Lords on the 1st of May 1641, excluding the bishops from the Lords and the clergy from secular offices, were passed, "there would be nothing more attempted to the prejudice of the church." Accordingly the bill was supported by Falkland. The times, however, were not favourable to compromise. The bill was lost in the Lords, and on the 27th of May the Root and Branch Bill, for the total abolition of episcopacy, was introduced in the House of Commons. This measure Falkland opposed, as well as the second bill for excluding the bishops, introduced on the 21st of October. In the discussion on the Grand Remonstrance he took the part of the bishops and the Arminians. He was now opposed to the whole policy of the opposition, and, being reproached by Hampden with his change of attitude, replied "that he had formerly been persuaded by that worthy gentleman to believe many things which he had since found to be untrue, and therefore he had changed his opinion in many particulars as well as to things as to persons."

The chief interest in Falkland does not lie in his writings or in the incidents of his career, but in his character and the distinction of his intellectual position, in his isolation from his contemporaries seeking reformation in the inward and spiritual life of the church and state, and not in his rôle as the leader and chief of rationalism in an age dominated by violent intolerance and narrow dogmatism. His personal appearance, according to Clarendon, was insignificant, "in no degree attractive or promising. His stature was low and smaller than most men; his motion not graceful ... but that little person and small stature was quickly found to contain a great heart ... all mankind could not but admire and love him."

FALKLAND, a royal and police burgh of Fifeshire, Scotland. Pop. (1905) 809. It is situated at the northern base of the hill called East Lawn or Morral, 147 ft. from the north-eastern road station (with which there is communication by 'bus), on the North British railway company's main line to Dundee, 21 m. N. of Edinburgh as the crow flies. It is an old-world-looking place, many of the ancient houses still standing. Its industries are chiefly concerned with the weaving of linen and the brewing of ale, for which it was once specially noted; and it has few public buildings save the town hall. The palace of the Stuarts, however, more beautiful than Holyrood and quite as romantic—lends the spot its fame and charm. The older edifice that occupied this site was a hunting-tower of the Macdougal family, which was erected on the site of the palace that was burned in 1572 to Robert Stewart, earl of Fife and Menteith, afterwards duke of Albany, second son of Robert II. Because of his father's long illness and the incapacity of Robert III, his brother Albany was during many years virtual ruler of Scotland, and, in the hope of securing the crown, caused the heir-apparent—David, duke of Rothesay—to be conveyed to the castle by force and then starved to death, in 1402. The conversion of the Thane's tower into the existing palace was begun by James III. and completed in 1538. The western part had two round towers, similar to those at Holyrood, which were also built by James V., and the southern elevation was ornamented with niches and statues, giving it a close resemblance to the Perpendicular style of the ecclesiastical architecture of England. The palace soon became the favourite summer residence of the Stuarts. From it James V. when a boy fled to Stirling by night from the custody of the earl of Angus, and in it he died in 1542.

Here, too, Queen Mary spent some of her happiest days, playing the country girl in its parks and woods. When the court was held at Falkland the Green was the daily scene of revelry and dance, and "To be Falkland bred" was a proverb that then came into use to designate a courtier. James VI. delighted in the palace and especially in its gardens. He upset the schemes of the Gowrie conspirators by escaping from Falkland to St Andrews, and it was while His Majesty was residing in the palace that the fifth earl of Bothwell, in 1592, attempted to kidnap him. In September 1596 an intensely dramatic interview took place in the palace between the king and Andrew Melville and other Presbyterian ministers sent by the general assembly at Cupar to remonstrate with him on allowing the Roman Catholic lords to return to Scotland. In 1654 the eastern wing was accidentally destroyed by fire, during its tenancy by the soldiers of Cromwell. It was afterwards restored by the Marquess of Fife, whose present palace was cut down for the building of a fort at Perth. Even in its neglected state the mansion impressed Defoe, who declared the Scottish kings owned more palaces than their English brothers. In 1715 Rob Roy garrisoned the palace and failed not to levy dues on the burgh and neighbourhood. Signs of decay were more evident when Thomas Carlyle saw it, for he likened it to "a black old bit of coffin or protrusive shin-bone striking through the soil of the dead past." But a munificent protector at length appeared in the person of the third marquess of Bute, who acquired the estate and buildings in 1888, and forthwith undertook the restoration of the palace.

Falkland became a royal burgh in 1458 and its charter was renewed in 1595, and before the earlier date it had been a seat of the Templars. It gives the title of viscount to the English family of Cary, the patent having been granted in 1620 by James VI.

The town's most distinguished native was Richard Cameron, the Covenant. His house—a three-storied structure with yellow-sashed front and thatched roof—still stands on the south side of the street called after him. The Hackstons of Rathillet also had a house in Falkland.

FALKLAND ISLANDS (Fr. Malouines; Span. Malvinas), a group of islands in the South Atlantic Ocean, belonging to Britain, and lying about 250 m. E. of the nearest point in the mainland of South America, between 51° and 53° S., and 57° 40' and 61° 25' W. With the uninhabited dependency of South Georgia Island, to the E.S.E., they form the most southerly colony of the British empire. The islands, childish of rocks, rocks, and the greatest of these, East Falkland, is 95 m. in extreme length, with an average width of 40 m., and the smaller, West Falkland, is 80 m. long and about 25 m. wide. The area of East Falkland is about 3000 sq. m., and that of West Falkland 2300. Most of the others are mere islets, the largest 16 m. long by 8 m. wide. The two principal islands are separated by Falkland Sound, a narrow strait from 18 to 24 m. in width, running nearly N.E. and S.W. The general appearance of the islands is not unlike that of one of the outer Hebrides. The general colouring, a faded brown, is somewhat dreary, but the mountain heights and promontories and the cliffs are a splendid sight, and the largest of these, East Falkland, is deeply indented and many of the bays and inlets form secure and well-protected harbours, some of which, however, are difficult of access to sailing ships.

East Falkland is almost bisected by two deep fjords, Choisel and Brenton Sounds, which leave the northern and southern portions connected only by an isthmus a mile and a half wide. The northern portion is hilly, and is crossed by a rugged range, the Wickham Heights, running east and west, and rising in some places to a height of nearly 2000 ft. The remainder of the island consists chiefly of low undulating ground, a mixture of pasture and moors, with many shallow freshwater tarns, and small streams running in the valleys. Two fine inlets, Berkeley Sound and Port William, run far into the land at the north-eastern extremity of the island. Port Louis, formerly the seat of government, is at the head of Berkeley Sound, but the anchorage there having been found rather too exposed, about the year 1844 a town was laid out, and the necessary public buildings were erected on Stanley Harbour, a sheltered recess within Port William. West Falkland is more hilly near the east island; the principal mountain range, the Hornby Hills, rises north and south parallel with Falkland Sound. Mount Adam, the highest hill in the islands, is 2315 ft. high.

The little town of Stanley is built along the south shore of Stanley harbour and stretches a short way up the slope; it has a population of little more than 900. The houses, mostly white with coloured roofs, are generally built of wood and iron, and have glazed porches, gay with fuchsias and pelargoniums. Government House, grey, stone-built and slated, calls to mind a manse in Shetland or Orkney. The government barrack is a rather imposing structure in the middle of the town, as is the cathedral church to the east, built of stone and buttressed with red granite, and with a spire 200 ft. high. The most northerly building is Darwin on Choisel Sound—a village of Scottish shepherds and a station of the Falkland Island Company.

The Falkland Islands consist entirely, so far as is known, of the older Palaeozoic rocks, Lower Devonian or Upper Silurian, slightly metamorphosed and a good deal crumpled and distorted, in the low ground clay slate and soft sandstone, and on the ridges hardened sandstone passing into the conspicuous white quartzites. There do not seem to be any minerals of value, and the rocks are not such as to indicate any probability of their discovery. Galena is found in small quantity, and in some places it contains a large percentage of silver. The dark bituminous layers of clay slate, which occur intercalated among the quartzites, have led, here as elsewhere, to the hope of coming upon a seam of coal, but it is contrary to experience that coal of any value should be found in rocks of that age.
Many of the valleys in the Falklands are occupied by pale glistening masses which at a little distance much resemble small glaciers. Examined more closely these are found to be vast accumulations of blocks of quartzite, irregular in form, but having a tendency to a rude diamond shape, from 2 to 20 ft. in length, and half as much in width, and of a color corresponding with that of the quartzite ridges on the hills above. The blocks are angular, and rest irregularly one upon another, supported in all positions by the angles and edges of those beneath. The whole mass looks as if it were, as it is, slowly sliding down the valley to the sea. These “stone runs” are looked upon with great wonder by the shifting population of the Falklands, and they are shown to visitors with many strange speculations as to their mode of formation. Their origin is attributed by some to the moraine formation of former glaciers. Another out of many theories is that the hard beds of quartzite are denuded by the disintegration of the softer layers. Their support being removed they break away in the direction of natural joints, and the fragments fall down the slope upon the vegetable soil. This soil is spongy, and, undergoing alternate contraction and expansion from being alternately comparatively dry and saturated with moisture, allows the heavy blocks to slip down by their own weight into the valley, where they become piled up, the valley stream afterwards removing the soil from among and over them.

The Falkland Islands correspond very nearly in latitude in the southern hemisphere with London, in the northern, but the climatic influences are very different. The temperature is equable, the average of the two midsummer months being about 47° Fahr., and that of the two winter months 37° Fahr. The extreme frosts and heats of the English climate are unknown, but occasional heavy snow-falls occur, and the sea in shallow inlets is covered with a thin coating of ice. The sky is almost constantly overcast, and rain falls, mostly in a drizzle and in frequent showers, on about 250 days in the year. The rainfall is not great, only about 20 in., but the mean humidity for the year is 80, saturation being 100. November is considered the only dry month. The prevalent winds from the west, south-west and south blow continually, at times approaching the force of a hurricane. “A region more exposed to storms both in summer and winter it would be difficult to mention” (Fitzroy, Voyages of “Adventure” and “Beagle,” i. 228). The fragments of many wrecks emphasize the dangers of navigation, which are increased by the absence of beacons, the only lighthouse being that maintained by the Board of Trade on Cape Pembroke near the principal settlement. Kelp is a natural danger-signal, and the sunken rock, “Uranie,” is reputed to be the only one not buoyed by the giant seaweed.

Of the inhabitants there is no trace in the Falklands, and the land fauna is very scanty. A small wolf, the louv-reward of de Bougainville, is extinct, the last having been seen about 1875 on the West Falkland. Some herds of cattle and horses run wild; but these were, of course, introduced, as were also the wild hogs, the numerous rabbits and the less common hares. All these have greatly declined in numbers, being profitably replaced by sheep. Land-birds are few in kind, and are mostly strays from South America. They include, however, the snipe and military starling, which on account of its scarlet breast is locally known as the robin. Sea-birds are abundant; and boats from the islands, having been comparatively lately peopled, they are singularly tame. Guils and amphibious birds abound in large variety; three kinds of penguin have their rookeries and breed here, migrating yearly for some months to the South American mainland. Stray specimens of the great king penguin have been observed, and there are also mollymawks (a kind of albatross), Cape pigeons and many carion birds. Kelp and upland geese abound, the latter being edible; and their shooting affords some sport.

The Falkland Islands form essentially a part of Patagonia, with which they are connected by an elevated submarine plateau, and their flora is much the same as that of Antarctic South America. The trees which form dense forest and scrub in southern Patagonia and in Fuegia are absent, and one of the largest plants on the islands is a gigantic woolly ragweed (Senecio caudicans) which attains in some places a height of 3 to 4 ft. A half-shrubby Veronica (V. decussata) is found in some parts, and has also received cultivators. The greater part of the “camp” (the open country) is formed of peat, which in some places is of great age and depth, and at the bottom of the bed very dense and bituminous. The peat is different in character from that of the northern European: cellular plants enter but little into its composition, and it is formed almost entirely of the roots and stems of Empetrum rubrum, a variety of the common cow-berry of the Scottish hills with red berries, called by the Falklanders the “diddle-dee” berry; of Myrtus nummularia, a little creeping myrtle whose leaves are used by the shepherds as a substitute for tea; of Calitha appendiculata, a dwarf species of marsh-marigold; and of some sedges and sedge-like plants, such as Astelia pumila, Gaimardia australis and Beothuka grandiflora. Peat is largely used as fuel, coal being obtained only at a cost of £3 a ton.

Two vegetable products, the “balsam bog” (Bolax globaria) and the “tussock grass” (Dactylis caespitosa) have been objects of curiosity and interest ever since the first accounts of the islands were given. The first is a huge mass of a bright green colour, living to a great age, and when dead becoming of a grey and stony appearance. When cut open, it displays an infinity of tiny leaf-buds and stems, and at intervals there enter into it an aromatic resin, which from its astringent properties is used by the shepherds as a vulnerary, but has not been converted to any commercial purpose. The “tussock grass” is a wonderful and most valuable natural production, which, owing to the introduction of stock, has become extinct in the two main islands, but still flourishes elsewhere in the group. It is a reed-like grass, which grows in dense tufts from 6 to 10 ft. high from stool-like root-crowns. It forms excellent fodder for cattle, and is regularly gathered for that purpose. It is of beautiful appearance, and the almost tropical profusion of its growth may have led to the early erroneous reports of the densely-wooded nature of these islands.

The population slightly exceeds 2000. The large majority of the inhabitants live in the East Island, and the predominating element is Scottish—Scottish shepherds having superseded the South American Gauchos. In 1867 there were no settlers on the west island, and the government issued a proclamation offering leases of grazing stations on very moderate terms. In 1868 all the available land was occupied. These lands are fairly healthy, the principal drawback being the virulent form assumed by simple epidemic maladies. The occupations of the inhabitants is almost entirely livestock. The principal industry is sheep-farming. Wool forms by far the largest export, and tallow, hides, bones and frozen mutton are also exported. Trade is carried on almost entirely with the United Kingdom; the approximate annual value of exports is £120,000, and of imports a little more than half that sum. The Falkland Islands Company, having its headquarters at Stanley and an important station in the camp at Darwin, carries on an extensive business in sheep-farming and the dependent industries, and in the general import trade. The development of this undertaking necessitated the establishment of stores and workshops at Stanley, and ships can be repaired and provided in every way; a matter of importance since not a few vessels, after suffering injury during heavy weather off Cape Horn, call on the Falklands in distress. The maintenance of the requisite plant and the high wages current render such repairs somewhat costly. A former trade in oil and sealskin has decayed, owing to the smaller number of whales and seals remaining about the islands. Communications are maintained on horseback and by water, and there are no roads except at Stanley. There is a monthly mail to and from England, the passage occupying about four weeks.

The Falkland Islands are a crown colony, with a governor and executive and legislative councils. The legislative council

1 See B Stechele, in Münchener geographische Studien, xx (1906), and Geographical Journal (December 1907).
consists of the governor and three official and two unofficial nominated members, and the executive of the same, with the exception that there is only one unofficial member. The colony is self-supporting, the revenue being largely derived from the drink duties, and there is no public debt. The Falklands are the seat of a colonial bishop. Education is compulsory. The government maintains schools and travelling teachers; the Falkland Islands Company also maintains a school at Darwin, and there is one for those of the Roman Catholic faith in Stanley.

There is also on Keppel Island a Protestant missionary settlement for the training in agriculture of imported Fuegians. Stanley was for some years a naval station, but ceased to be so in 1904.

The Falkland Islands were first seen by Davis in the year 1592, and Sir Richard Hawkins sailed along their north shore in 1594. The claims of Amerigo Vespucci to a previous discovery are doubtful. In 1598 Sebald de Wert, a Dutchman, visited them, and called them the Sebald Islands, a name which they bear on some Dutch maps. Captain Strong sailed through between the two principal islands in 1606, landed upon one of them, and called the passage Falkland Sound, and from this the group afterwards took its English name. In 1764 the French explorer De Bougainville took possession of the islands on behalf of his country, and established a colony at Port Louis on Berkeley Sound. But in 1767 France ceded the islands to Spain, De Bougainville being employed as intermediary. Meanwhile in 1765 Commodore Byron had taken possession on the part of England on the ground of prior discovery, and had formed a settlement at Port Egmont on the small island of Saunders. The Spanish and English settlers remained in ignorance, real or assumed, of each other’s presence until 1769-1770, when Byron’s action was nearly the cause of a war between England and Spain, both countries having armed fleets to contest the barren sovereignty. In 1771, however, Spain yielded the islands to Great Britain by convention. As they had not been actually colonized by England, the republic of Buenos Aires claimed the group in 1820, and subsequently entered into a dispute with the United States of America concerning the rights to the products of these islands. On the representations of Great Britain the Buenos Aires withdrew, and the British flag was once more hoisted at Port Louis in 1833. It was not until that time the Falkland Islands had been a regular British colony.

In 1843 Mr S. Lafone, a wealthy cattle and hide merchant on the river Plate, obtained from government a grant of the southern portion of the island, a peninsula 600,000 acres in extent, and possession of all the wild cattle on the island for a period of six years, for a payment of £10,000 down, and £2,000 in ten years from January 1, 1852. In 1851 Mr Lafone’s interest in Lafonia, as the peninsula came to be called, was purchased for £30,000 by the Falkland Islands Company, which had been incorporated by charter in the same year.

**FALLACY** (Lat. fall-ax, apt to mislead), the term given generally to any mistaken statement used in argument; in Logic, technically, an argument which violates the laws of correct demonstration. An argument may be fallacious in matter (i.e. misstatement of facts), in wording (i.e. wrong use of words), or in the process of inference. Fallacies have, therefore, been classified as: I. Material, II. Verbal, III. Logical or Formal; and II. and III. are often included under the general description Logical, and in scholastic paralogy, following Aristotle, are called fallacies in dictio or in voce, as opposed to material fallacies in re or extra dictionem.

I. Material.—The classification widely adopted by modern logicians and based on that of Aristotle, Organon (Sophisticum Dichotomiae), has been as follows:—(1) Fallacy of Accident, i.e. arguing erroneously from a general rule to a particular case, without proper regard to particular conditions which vitiate the application of the general rule; e.g. if manhood suffice the law, arguing that a criminal or a lunatic must, therefore, have a vote; (2) Converse Fallacy of Accident, i.e. arguing from a special case to a general rule; (3) Irrelevant Conclusion, or Ignoratio Elenchi, wherein, instead of proving the fact in dispute, the arguer seeks to gain his point by diverting attention to some extraneous fact (as in the legal story of No case. Abuse the plaintiff’s attorney’). Under this head come the so-called argumentum ad hominem, (a) ad populum, (b) ad baculum, (d) ad reverandum, (e) ad invicem, common in platform oratory, in which the speaker obscures the real issue by appealing to his audience on the grounds of (a) purely personal considerations, (b) popular sentiment, (c) fear, (d) conventional propriety. This fallacy has been illustrated by ethical or theological arguments wherein the fear of punishment is subtly substituted for abstract right as the sanction of moral obligation. (4) Petito principis (begging the question) or Circulus in probando (arguing in a circle), which consists in demonstrating a conclusion by means of premises which precede it in the argument. Jeremy Bentham points out that this fallacy may lurk in a single word, especially an adjective, e.g. if a measure were condemned simply on the ground that it is alleged to be “un-English”; (5) Fallacy of the Consequent, really a species of (3), wherein a conclusion is drawn from premises which do not really support it; (6) Fallacy of False Cause, or Non Sequitur (“it does not follow’’), wherein one thing is incorrectly assumed as the cause of another, as when the ancients attributed a public calamity to a meteorological phenomenon; (7) Fallacy of Many Questions (Plurium Interrogationum), wherein several questions are improperly grouped in the form of one, and a direct categorical answer is expected; (d) ad reverandum; (e) ad invicem; (f) ad invicem; (g) ad invicem; (h) ad invicem; (i) ad invicem; (j) ad invicem; (k) ad invicem; (l) ad invicem; (m) ad invicem; (n) ad invicem; (o) ad invicem; (p) ad invicem; (q) ad invicem; (r) ad invicem; (s) ad invicem; (t) ad invicem; (u) ad invicem; (v) ad invicem; (w) ad invicem; (x) ad invicem; (y) ad invicem; (z) ad invicem.

II. Verbal Fallacies are those in which a false conclusion is obtained by improper or ambiguous use of words. They are generally classified as follows. (1) Equivocation consists in employing the same word in two or more senses, e.g. in a syllogism, the middle term being used in one sense in the major and another in the minor premise, so that in fact there are four not three terms (“All fair things are honourable. This woman is fair; therefore this woman is honourable,” the second “fair” being in reference to complexion). (2) Amphibology is the result of ambiguity of grammatical structure, e.g. of the position of the adverb “only” in careless writers (“He only said that,” in which sentence, as experience shows, the adverb has been intended to qualify any one of the other three words). (3) Composition, a species of (1), which results from the confused use of collective terms (“The angles of a triangle are less than two right angles” might refer to the angles separately or added together). (4) Divinatio or the converse of the preceding, which consists in introducing the major term in the minor and collectively in the major premise. (5) Accent, which occurs only in speaking and consists of emphasizing the wrong word in a sentence (“He is a fairly good pianist,” according to the emphasis on the words, may imply praise of a beginner’s progress, or an expert’s depreciation of a popular hero, or it may imply that the person in question is a deplorable violinist). (6) Figure of Speech, the confusion between the metaphorical and ordinary uses of a word or phrase.

III. The purely Logical or Formal fallacies consist in the violation of the formal rules of the Syllogism (q.v.). They are
(a) fallacy of Four Terms (Quaternio terminorum); (b) of Undistributed Middle; (c) of Illicit process of the major or the minor term; (d) of Negative Premises.

Of other classifications of Fallacies in general the most famous are those of Francis Bacon and J. S. Mill. Bacon (Novum Organum, Aph. I. 33, 38 sqq.) divided fallacies into four Idola (1867, i.e. False Appearances), which summarize the various kinds of mistakes to which the human intellect is prone (see Bacon, Francis). With these should be compared the Offenbild according to Roger Bacon, contained in the Opus major, pt. i. (see Bacon, Roger).

J. S. Mill discussed the subject in book v. of his Logic, and Jeremy Bentham's Book of Fallacies (1824) contains valuable remarks. See R. Whatley's Logic, bk. v.: A. de Morgan, Formal Logic (1847); A. v. Humboldt, Fallacies (1850) and other textbooks. See also Aristotle, Logic, and for fallacies of Induction, see INDUCTION.

FALLIERES, CLÉMENT ARMAND (1841— ), president of the French republic, was born at Mâcon in the department of Lot-et-Garonne, where his father was clerk of the peace. He studied law and became an advocate at Nérac, beginning his public career there as municipal councillor (1858), afterwards mayor (1871), and as councillor-general of the department of Lot-et-Garonne (1871). Being an ardent Republican, he lost this position in May 1873 upon the fall of Thiers, but in February 1876 was elected deputy for Nérac. In the chamber he sat with the Republican Left, signed the protestation of the 18th of May 1877, and was re-elected in October by his constituency. In 1880 he was appointed a member of the committee of the interior in the Jules Ferry ministry (May 1880 to November 1881). From the 7th of August 1882 to the 20th of February 1883 he was minister of the interior, and for a month (from the 29th of January 1883) was premier. His ministry had to face the question of the expulsion of the pretenders to the throne of France, owing to the proclamation by Prince Jérôme Napoleon (January 1883), and M. Fallières, who was ill at the time, was not able to face the storm of opposition, and resigned when the senate rejected his project. In the following November, however, he was chosen as minister of public instruction by Jules Ferry, and carried out various reforms in the school system. He resigned with the ministry in March 1884. Again becoming minister of the interior in the Rouvier cabinet in May 1887, he exchanged his portfolio in December for that of justice. He returned to the ministry of the interior in February 1889, and finally took the department of justice from March 1890 to February 1892. In June 1890 his department (Lot-et-Garonne) elected him to the senate by 417 votes to 23. There M. Fallières remained somewhat apart from party struggles, although maintaining his influence among the Republicans. In March 1899 he was appointed minister of the interior until January 1906, when he was chosen by a union of the groups of the Left in both chambers as candidate for the presidency of the republic. He was elected on the first ballot by 449 votes against 371 for his opponent, Paul Doumer.

FALL-LINE, in American geology, a line marking the junction between the hard rocks of the Appalachian Mountains and the softer deposits of the coastal plain. The pre-Cambrian and metamorphic rocks of the mountain mass form a continuous ledge parallel to the east coast, where they are subject to denudation and form a series of "falls," as rapids in the river courses along this line. The relief of the land below the falls is very slight, and this low country rarely rises to a height of 200 ft., so that the rivers are navigable up to the falls, while the falls themselves are a valuable source of power. A line of cities may be traced upon the map whose position will thus be readily understood in relation to the economic importance of the fall-line. They are Trenton on the Delaware, Philadelpia on the Schuylkill, Georgetown on the Potomac, Richmond on the James, and Augusta on the Savannah. It will be readily understood that the softer and more recent rocks of the coastal plain have been modified by the sea, which, whether stationary,-wide standing above them, and that the trend of the edge of this great lenticular mass of ancient rock is roughly parallel to that of the Appalachian system.

FALLMERAYER, JAKOB PHILIPP (1790—1861), German traveller and historical investigator, best known for his opinions in regard to the ethnology of the modern Greeks, was born, the son of a poor peasant, at Tschösch, near Brixen in Tirol, on the 14th of December 1790. In 1809 he was admitted to the cathedral choir school at Brixen and made his way to Salzburg, where he supported himself by private teaching while he studied theology, the Semitic languages, and history. After a year's study he sought to assure to himself the peace and quiet necessary for a student's life by entering the abbey of Kremsmünster, but difficulties put in his way by the Bavarian officials prevented the accomplishment of this intention. At the university of Landshut, to which he removed in 1812, he first applied himself to jurisprudence, but soon devoted his attention exclusively to history and philology. He was immediately provided for by a rich patron. During the Napoleonic wars he joined the Bavarian infantry as a subaltern in 1813, fought at Hanau (30th October 1813), and served throughout the campaign in France. He remained in the army of occupation on the banks of the Rhine until Waterloo, where he spent six months at Orleans as adjutant to General von Spreti. Two years of garrison life at Lindau on Lake Constance after the peace were spent in the study of modern Greek, Persian and Turkish.

Resigning his commission in 1818, he was successively engaged as teacher in the gymnasia at Augsburg and in the gymnasia and seminaries of Baden and Württemberg. He was presented with a gold medal offered by the university of Copenhagen with his Geschichte des Kaiseriums von Tragwein, based on patient investigation of Greek and oriental MSS. at Venice and Vienna. The strictures on priestcraft contained in the preface to this book gave offence to the authorities, and his position was not improved by the liberal views expressed in his Geschichte der Halbinsel Morea während des Mittelalters (Stuttgart, 1830—1836, 2 pts.). The three years from 1831 to 1834 he spent in travel with the Russian count Oestermann Tolstoy, visiting Egypt, Palestine, Syria, Cyprio, the Ionian Islands, Constantinople, Greece and Naples. On his return he was elected in 1835 a member of the Royal Bavarian Academy of Sciences, but he soon after left the country again on account of political troubles, and spent the greater part of the next four years in travel, spending the winter of 1839—1840 with Count Tolstoy at Geneva. Constantinople, Trebizond, Athos, Macedonia, Thessaly and Greece were visited by him during 1840—1841; and after some years' residence in Munich he returned in 1847 to the East, and travelled in Palestine, Syria and Asia Minor. The authorities continued to regard him with suspicion, and university students were forbidden to attend the lectures he delivered at Munich. He entered, however, into friendly relations with the crown prince Maximilian, but this intimacy was destroyed by the events following on 1848. At that period he was appointed professor of history in the Munich University, and made a member of the national congress at Frankfurt-on-Main. He there joined the left opposition party, and in the following year he accompanied the rump-parliament to Stuttgart, a course of action which led to his expulsion from his professorate. During the winter of 1849—1850 he was an exile in Switzerland, but the amnesty of April 1850 enabled him to return to Munich. He died on the 26th of April 1861.

His contributions to the medieval history of Greece are of great value, and though his theory that the Greeks of the present day are of Albanian and Slav descent, with hardly a drop of true Greek blood in their veins, has not been accepted in its entirety by other investigators, it has served to modify the opinions of even his greatest opponents. A criticism of his views will be found in Hopf's Geschichte Griechenlands (reprinted from Ersch and Gruber's Encyl.), and in Finlay's History of Greece in the Middle Ages, by a man far in advance of him in the possession of adequate knowledge, but driven by the spirit of the day to exaggerate and idealize. The capture of Constantinople by Russia was inevitable, and would lead to the absorption by the Russian empire of the whole of the Balkan and Grecian
peninsula; and that this extended empire would constitute a standing menace to the western Germanic nations. These views he expressed in a series of brilliant articles in German journals. His most important contribution to learning remains his history of the empire of Trebizond. Prior to his discovery of the chronicle of Michael Panaretos, covering the dominion of Alexius Comnenus and his successors from 1204 to 1426, the history of this medieval empire had been unknown.

His works are—Geschichte des Kaiserthums Trapezunt (Munich, 1827-1848); Geschichte der Halbinsel Morea im Mittelalter (Stuttgart, 1830-1836); Uber die Entstehung der Neugriechen (Stuttgart, 1835); "Originallustre, Chroniken, Tragesamkeit" (Munich, 1842), in Abhandl. der hist. Classe der K. Bayerisch. Akad. v. Wiss.; Fragmente aus dem Orient (Stuttgart, 1845); Denkschrift über Golgotha und das heilige Grab (Munich, 1852), etc. (1853)—both of which had appeared in the Abhandlungen of the Academy; Das albanesische Element in Griechenland, iii. parts, in the Abhandl. for 1860-1866. After his death there appeared at Leipzig in 1861, under the editorship of G. M. Thomas, three volumes of Gesammelte Werke, containing New Fragmente aus dem Orient, Kritische Versuche, and Studien und Erinnerungen aus meinem Leben. A sketch of his life will also be found in L. Stueb, Herbststage in Tyrol (Munich, 1867).

FALLOPIUS (or FALLONIUS), GABRIELLO (1525-1563), Italian anatomist, was born about 1525 at Modena, where he became a canon of the cathedral. He studied medicine at Ferrara, and, after a European tour, became teacher of anatomy in that city. He thence removed to Pisa, and from Pisa, at the instance of Cosimo I., grand-duke of Tuscany, to Padua, where, besides the chairs of anatomy and surgery and of botany, he held the office of superintendent of the new botanical garden. He died at Padua on the 9th of October 1562. Only one treatise by Fallonius appeared during his lifetime, namely the Observationes anatomicae (Venice, 1561). His collected works, Opera genuina omnia, were published at Venice in 1584. (See Anatomy, K. FALLOUX, FRÉDÉRIC ALFRED PIERRE, Comte de (1811-1890), French statesman and author, was born at Angers on the 10th of May 1811. His father had been ennobled by Charles X., and Falloux began his career as a Legitimist and clerical journalist under the influence of Mme Swetchine. In 1846 he entered the legislature as deputy for Maine-et-Loire, and with many other ultra-Catholics he gave real or pretended support to the revolution of 1848. Louis Napoleon made him minister of education in 1849, but disagreements with the president led to his resignation within a year. He had nevertheless secured the passage of the Loi Falloux (March 15, 1850) for the organization of primary and secondary education. This law, which placed the clergy and members of ecclesiastical orders, male and female, might exercise the profession of teaching without producing any further qualification. This exemption was extended even to priests who taught in secondary schools, where a university degree was exacted from lay teachers. The primary schools were put under the management of the curés. Falloux was elected to the French Academy in 1856. His failure to secure re-election to the legislature in 1866, 1869, 1870 and 1871 was due to the opposition of the stricter Legitimists, who viewed with suspicion his attempts to reconcile the Orleans princes with Henri, comte de Chambord. In spite of his failure to enter the National Assembly his influence was very great, and was increased by the intimacy of his personal relations with Thiers. But in 1872 he offended both sections of the monarchical party at a conference arranged in the hope of effecting a fusion between the partisans of the comte de Chambord and of the Orleans princes, divided on the vexed question of the flag. He suggested that the comte de Chambord might recede from his position with dignity at the desire of the National Assembly, and not content with this encroachment on royalist principles, he insinuated the possibility of a transitional stage with the duc d'Orléans as president of the republic. His disgrace was so complete that he was excommunicated by the bishop of Angers in 1876. He died on the 16th of January 1886.

Of his numerous works the best known are his Histoire de Louis XVI (1840); Histoire de Saint Pie (1845); De la contre-revolution (1870); and the posthumous Mémoires d’un royaliste (2 vols., 1888).

FALLOW, land ploughed and tilled, but left unsown, usually for a year, in order, on the one hand, to disintegrate, aerate and free it from weeds, and, on the other, to allow it to recuperate. The word was probably early confused with "fallow" (from O. Eng. fæld, probably cognate with Gr. ράδος, grey), of a pale-brown or yellow colour, often applied to soil left untilled and unsown, but chiefly seen in the name of the "fallow deer." The true derivation is from the O. Eng. falça, only found in the plural, a barrow, and the ultimate origin is a Teutonic root meaning "to plough," cf. the German falgen. The recognition that continuous growing of wheat on the same area of land robs the soil of its fertility was universal among ancient peoples, and the practice of "fallowing" or resting the soil is as old as agriculture itself. The "Sabbath rest" ordered to be given every seventh year to the land by the Mosaic law is a classical instance of the "fallow." Improvements in crop rotations and manuring have diminished the necessity of the "bare fallow," which is uneconomical because the land is left unproductive, and because the nitrates in the soil intercepted by the roots of plants are washed away in the drainage waters. At the present time bare fallowing is, in general, only advisable on still soils and in dry climates. A "green fallow" is land planted with turnips, potatoes or some similar crop in rows, the space between which may be cleared of weeds by hoeing. The "barest fallow" is a modification of the bare fallow, effected by the growth of rye, vetches, or some other rapidly growing crop, sown in autumn and fed off in spring, the land then undergoing the processes of ploughing, grubbing and harrowing usual in the bare fallow.

FALLOW-DEER (that is, DUN DEER, in contradistinction to the red deer, Cervus [Dama] dama), a medium-sized representative of the family Cervidae, characterized by its expanded or palmed antlers, which generally have no bez-tine, rather long tail (black above and white below), and a coat spotted with white in summer but uniformly coloured in winter. The shoulder height is about 3 ft. The species is semi-domesticated in British parks, and occurs wild in western Asia, North Africa, the south of Europe and Sardinia. In prehistoric times it occurred throughout northern and central Europe. One park-bred has no spots. Bucks and does live apart except during the pairing-season; and the doe produces one or two, and sometimes three fawns at a birth. These deer are particularly fond of horse-chestnuts, which the stags are said to endeavour to procure by striking at the branches with their antlers. The Persian fallow-deer (C. [D.] mesopotamicus), a native of the mountains of Luristan, is larger than the typical species, and has a brighter coat, differing in some details of colouring. The antlers have the tree-size near the small brow-tine, and the palmation begins from the former. Here may be mentioned the plank-tailed type, a fossil deer commonly known as the Irish elk, which is perhaps a giant type of fallow-deer, and if so should be known as Cervus [Dama] giganteus. If a distinct type, its title should be C. (Megaceros) giganteus. This deer inhabited Ireland, Great Britain, central and northern Europe, and western Asia in Pleistocene and prehistoric times; and must have stood 6 ft. high at the shoulder. The antlers are greatly palmed and of enormous size, fine specimens measuring as much as 11 ft. between the tips.

FALL RIVER, a city of Bristol county, Massachusetts, U.S.A., situated on Mount Hope Bay, at the mouth of the Taunton river, 40 m. S. of Boston, Pop. (1880) 74,308; (1900) 104,863; (estimated, 1906) 105,942; (1910 census) 119,705. It is the third city in size of the commonwealth. Of the population in 1900, 59,042, or 47.7% were foreign-born, 90,244 were of foreign parentage (i.e. either one or both parents were foreign), and of these 81,727 had both foreign father and foreign mother. Of the foreign-born, 20,172 were French Canadians, 2329 were English Canadians, 12,268 were from England, 10,45 were from Scotland, 7317 were from Ireland, 2805 were from Portugal, and 1003 were from Russia, various other countries being represented by smaller numbers. The small increase between 1900 and 1906 was due in large part to the emigration of many of the inhabitants during the great strike of 1904-1905.
The water under the principal large, aldermen cotton municipal in dwellings frequent and next health. Excellent almost United in textile excellent Congregational Durfee plateau harbour evidence, Hartford i was very large mills and a stockholders area (1901) $35,442,581, (as great a) area controlled water-supply. The part 3,000,000 which was opened by the banks and the factories of Lowell, the of the Lowell, the area of the city is 13,043 acres, with nearly 700 linear yards of quayage. There are two granite docks, one higher grade granite, timber, coal and guano and other manures are imported, and granite, china clay, copper ore, ropes and fish exported. Falmouth is also in favour as a watering-place. The municipal borough of Penryn and Falmouth returns one member. The municipal borough is under a mayor, 4 aldermen and 12 councillors. Area, 790 acres.

Falmouth (Falemuth) as a haven and port has had a place in the maritime history of Cornwall from very early times. The site of the town, which is comparatively modern, was formerly known as Smithick and Pennycomequick and formed part of the manor of Arwenack held by the family of Killigrew. The corporations of Penryn, Truro and Helston opposed the taking, but the lords in council, to whom the matter was referred, decided in Killigrew's favour. In 1632 the House of Commons considered that it would be advantageous to the Commonwealth to grant a Thursday market to Smithick. This market was confirmed to Sir Peter Killigrew in 1660 together with two fairs, on the 30th of October and the 27th of July, and also a ferry between Smithick and Falmouth. By the charter of incorporation granted in 1672, the ferry was confirmed by the name being changed to Falmouth, and a mayor, recorder, 7 aldermen and 12 councillors were also granted. A common council with the usual rights and privileges. Three years later an act creating the borough a separate ecclesiastical parish empowered the mayor and aldermen to assess all buildings within the town at the rate of sixteen pence in the pound for the support of the rector. This rector's rate occasioned much ill-feeling in modern times, and by act of parliament in 1806 was taken over by the corporation, and provision made for its eventual extinction. The disfranchisement of Penryn, which
had long been a subject of debate in the House of Commons, was settled in 1832, by uniting Penryn with Falmouth for parliamentary purposes and assigning two members to the united boroughs. By the Redistribution of Seats Act 1885, the number of members was reduced to one. The fairs granted in 1660 are no longer held, and a Saturday market has superseded the chartered market. In the 17th and 18th centuries Falmouth grew in importance owing to its being a station of the Packet Service for the conveyance of mails.

**FALSE POINT,** a landlocked harbour in the Cuttack district of Bengal, India. It was reported by the famine commissioners in 1867 to be the best harbour on the coast of India from the Hugli to Bombay. It derives its name from the fact that vessels proceeding up the Bay of Bengal frequently mistook it for Point Palmyras, a degree farther north. The anchorage is safe, roomy and completely landlocked, but large vessels are obliged to lie out at some distance from its mouth in an exposed roadstead. The capabilities of False Point as a harbour remained long unknown, and it was only in 1860 that the port was opened. It was rapidly developed, owing to the construction of the Orissa canals. Two navigable channels lead inland across the Mahanadi delta, and connect the port with Cuttack city. The trade of False Point is chiefly with other Indian harbours, but a large export trade in rice and oil-seeds has sprung up with Mauritius, the French colonies and France. False Point is now a regular port of call for Anglo-Indian coasting steamers. Its capabilities were first appreciated during the Orissa famine of 1866, when it afforded almost the only means by which supplies of rice could be thrown into the province. A lighthouse is situated a little to the south of the anchorage, on the point which screens it from the southern monsoon.

**FALSE PRETENCES,** in English law, the obtaining from any other person by any false pretence any chattel, money or valuable security, with intent to defraud. It is an indictable misdemeanour under the Larceny Act of 1861. The broad distinction between this offence and larceny is that in the former the owner intends to part with his property, in the latter he does not. This offence dates as a statutory crime practically from 1756. At common law the only remedy originally available for an owner who had been deprived of his goods by fraud was an indictment for the crime of cheating, or a civil action for deceit. These remedies were insufficient to cover all cases where money or other properties had been obtained by false pretences, and the offence was first partially created by a statute of Henry VIII. (1541), which provided that if any person should falsely and deceitfully obtain any money, goods, &c., by means of any false token or counterfeit letter made in any other man's name, the offender should suffer any punishment other than death, at the discretion of the judge. The scope of the offence was enlarged to include practically all false pretences by the act of 1756, the provisions of which were embodied in the Larceny Act 1861.

The principal points to notice are that the pretence must be a false pretence of some existing fact, made for the purpose of inducing the prosecutor to part with his property (e.g. it was held not to be a false pretence to promise to pay for goods on delivery, if the goods were bad or counterfeit). The property, too, must have been actually obtained by the false pretence. The owner must be induced by the pretence to make over the absolute and immediate ownership of the goods, otherwise it is "larceny by means of a trick." It is not always easy, however, to draw a distinction between the various classes of offences. In the case where a man goes into a restaurant and orders a meal, and, after consuming it, says that he has no means of paying for it, it was usual to convict for obtaining food by false pretences. But R. v. Jones, 1809, L.R. 1 Q.B. 119 decided that it is neither larceny nor false pretences, but an offence under the Debtor's Act 1869, of obtaining credit by fraud. (See also CHEATING; FRAUD; LARCENY.)

**United States.**—American statutes on this subject are mainly copied from the English statutes, and the courts there in a general way follow the English interpretations. The statutes of each state must be consulted. There is no Federal statute, though there are Federal laws providing penalties for false personation of the lawful owner of public stocks, &c., or of persons entitled to pensions, prize money, &c. (U.S. Rev. Stats. § 5433), or the false making of any order purporting to be a money order (id. § 5402).

In Arizona, obtaining money or property by falsely personating another is punishable as for larceny (Penal Code, 1901, § 479). Obtaining credit by false pretences as to wealth and mercantile character is punishable by six months' imprisonment and a fine not exceeding three times the value of the money or property obtained (id. § 481).

In Illinois, whoever by any false representation or writing signifies by him, of his own respectability, wealth or mercantile correspondence or connexions, obtains credit and thereby defrauds any person of money, goods, chattels or any valuable thing, or who procures another to make a false report of his honesty, wealth, &c., shall return the money, goods, &c., and be fined and imprisoned for a term not exceeding one year (Crim. Code, 1903, ch. xxxvii. §§ 95, 97). Obtaining money or property by bogus cheques, the "confidence game" (Dorr v. People, 1907, § 228, II. 210), or "three card monte," sleight of hand, fortune-telling, &c., is punishable by imprisonment for from one to ten years (id. §§ 98, 185). Obtaining goods from warehouse, mill or wharf by false pretends—obtain by means of false and fraudulent receipt wrongly stating right of property, deposed—by imprisonment for not less than one nor more than ten years (id. § 124). Fraudulent use of railroad passes is a misdemeanour (id. 125a).

In Massachusetts it is simple larceny to obtain by false pretences the money or personal chattel of another (Rev. Laws, 1902, ch. cviii. § 20). Obtaining by a false pretence with intent to defraud the signature of a person to a written instrument, the false making whereof would be forgery, is punishable by imprisonment in a state prison or by fine (id. § 27).

In New York, obtaining property by false pretences, felonious breach of trust and embezzlement are included in the term "larceny" (Penal Code, § 528; Paul v. Dumas, 106 N.Y. 508; People v. Taatkehan, 1907, 104 N.Y. Suppl. 853), but the methods of proof required to establish each crime remain as before the code. Obtaining lodging and food on credit at hotel or lodging house with intent to defraud is a misdemeanour (Pen. Code, § 382). Purchase of property by false pretences as to person's means or ability to pay is not criminal when in writing signed by the party to be charged (Pen. Code, § 544).
saw-mills, and besides the output of the copper mines it produces manufactured iron and steel, timber, wood-pulp, bricks and charcoal. Falun has also railway rolling-stock factories. There are museums of mineralogy and geology, a lower school of mining, model room and scientific library. The so-called "Gothenburg System" of municipal control over the sale of spirits was actually devised at Falun as early as 1830.

FAMA (Gr. Φήμη, "Ostos"), in classical mythology, the personification of Rumour. The Homeric equivalent Ossa (Ilid. II. 53) is represented as the messenger of Zeus, who spreads reports with the rapidness of the wind. This does not personify Pheme, which is merely a presage drawn from human utterances, whereas Ossa (until later times) is associated with the idea of divine origin. A more definite character is given to Pheme by Hesiod (Works and Days, 764), who calls her a goddess; in Sophocles (Oed. Tyr. 158) she is the immortal daughter of golden Hope and is styled by the orator Aeschines (Contra Timarchum, § 128) one of the mightiest of goddesses. According to Pausanias (i. 17. i) there was a temple of Pheme at Athens, and at Smyrna (ib. ix. 11. 7), whose inhabitants were especially fond of seeking the aid of divination, there was a sanctuary of CLEDONES (sounds of the voice) there is an earth (ib. xx. 22).

There does not seem to have been any cult of Fama among the Romans, by whom she was regarded merely as a "figure of poetical religion." The Temple of Fame and Omen (Pheme and Cledon) mentioned by Plutarch (Moralia, p. 319) is due to a confusion with Aius Locutius, the divinity who warned the Romans of the coming attack of the Gauls. There are well-known descriptions of Fame in Virgil (Aeneid, iv. 173) and Ovid (Metam. xii. 39); see also Valerius Flaccus (i. 713), Statius (Thebais, iii. 479). An unfavourable idea gradually became attached to the name, thus Ennius speaks of Fama as the personification of the "evil" reputation and the opposite of Gloria (cp. the adjective famosus, which is not used in a good sense till the post-Augustan age). Chaucer in his House of Fame is obviously imitating Virgil and Ovid, although he is also indebted to Dante's Divina Commedia.

FAMAGUSTA (Gr. Ammochostos), a town and harbour on the east coast of Cyprus, 73 m. S. of the ruins of Salamis. The population in 1901 was 518, nearly all being Moslems who live within the walls of the fortress; the Christian population has migrated to a suburb called Varosa (pop. 1948). The foundation of Famagusta is ascribed to Teucer; it was probably the most important town in early Cyprus. The revolt of the Jews under Trajan, and earthquakes in the time of Constantius and Constantine the Great helped in turn to destroy it. It was restored by Fl. Constantius II. (A.D. 337-361) as Constantia. Another town a little to the south, built by Ptolemay Philadelphus in 274 B.C., and called Arsinoe in honour of his sister, received the refugees driven from Constantinia by the Arabs under Mu'awiyah, became the seat of the orthodox archbishopric, and was eventually known as Famagusta. It received a large accession of population at the fall of Acre in 1291; was annexed by the Genoese in 1377; reunited to the throne of Cyprus in 1464; and surrendered, after an investment of nearly a year, to the Turks in 1571. The fortifications, remodelled by the Venetians after 1489, the castle, the grand cathedral church of St Nicolas, and the remains of the palace and many other churches make Famagusta a place of unique interest. Acts ii. and v. of Shakespeare's Othello pass there. In 1903 measures were taken to develop the fine natural harbour of Famagusta. Basins were dredged to give depths of 13 and 24 ft. respectively at ordinary low tides, and commodious jetties and quays were constructed.

FAMILIAR (through the Fr. familier, from Lat. familiaris, of or belonging to the familia, family), an adjective, properly meaning belonging to the family or household, but in this sense the word is rare. The more usual meanings are: friendly, intimate, well known; and from its application to the easy relations of intimate friends the term may be used in an invidious sense of "free and easy" conduct on the part of any one not justified by any close relationship, friendship or intimacy. "Familiar" is, however, also used as a substantive, especially of the spirit or demon which attended on a wizard or magician, and was summoned to execute his master's wishes. The idea underlies the notion of the Christian guardian angel and of the Roman genius natalis (see DEMONOLOGY; WITCHCRAFT). In the Roman Church the term is applied to persons attached to the household of the pope or of bishops. These must actually do some domestic service. They are supported by their patron, and enjoy privileges which in the case of the papal familiars are considerable. "Familiars of the Holy Office" were lay officers of the Inquisition, whose functions were chiefly those of police, in making arrests, &c., of persons charged.

FAMILISTS, a term of English origin (later adopted in other languages) to denote the members of the Familia Caritatis (Hus der Liefen; Huis der Liefde; Haus der Liebe; "Family of Love"), founded by Hendrik Nicolaes (born on the 9th or 10th of January 1501 or 1502, probably at Münster; died after 1570, not later than 1581, probably in 1580). His calling was that of a merchant, in which he and his son Franz prospered, becoming ultimately wealthy. Not till 1540 did he appear in the character of one divinely endowed with "the spirit of the true love of Christ." For twenty years he was the headquarters at once of his merchandise and of his propaganda; but he travelled in both interests to various countries, visiting England in 1552 or 1553. To this period belong most of his writings. His primary work was Den Spiegel der Gerechtigkeit durch den Geist der Liefden und den vergodeden Mensch H.N. uith de hemelmesche Warheit betuyt. It appeared in an English form with the author's revision, as An Introduction to the holy Understanding of the Glasse of Righteousness (1577; republished in 1649). None of his works bear his name in full; his initials were mistakenly interpreted as standing for Hemo Novus. His "glass of righteousness" is the spirit of Christ interpreted by him. The remarkable fact was brought out by G. Arnold (and more fully by F. Nippold in 1862) that the printer of Nicolaes's works was Christopher Plantin, of Antwerp, a specially privileged printer of Roman Catholic theology and liturgy, yet secretly a steadfast adherent of Nicolaes. It is true that Nicolaes claimed to hold an impartial attitude towards all existing religious parties, and his mysticism, derived from David Joris, was undogmatic. Yet he admitted his followers by the rite of adult baptism, and set up a hierarchy among them on the Roman model. He gave his Evangelium Regni, in English, A Joyful Message of the Kingdom, 1557; republished, 1650. His pamphlets had an antinomian drift; for himself and his officials he claimed impeccability; but, whatever truth there may be in the charge that among his followers were those who interpreted "love" as licence, no such charge can be sustained against the morals of Nicolaes and the other leaders of the sect. His chief apostle in England was Christopher Videl, a native of Delft, an "illuminated elder," living at Colchester and Southwark, who ultimately recanted. The society spread in the eastern counties, in spite of repressive measures; it revived under the Commonwealth, and lingered into the early years of the 18th century; the leading idea of its "service of love" was reliance on human charity and tenderness for the moral and spiritual edification of its members. Thus, in an age of strife and polemics, it seemed to afford a refuge for quiet, gentle spirits, and meditative temperaments.

FAMILY, a word of which the etymology but partially illustrates the meaning. The Roman familia, derived from the Oscan famel (serrus), originally signified the servile property, the thralls, of a master. Next, the term denoted other domestic property, in things as well as in persons. Thus, in the 5th of the laws of the Twelve Tables, the rules are laid down: si intestato mortur, cur suus, heres, nec sit, cognatus,
PROXIMUS • FAMILIAM • HABETO, et *-AGNATUS • NEC • ESCIT • GENTILIS • FAMILIAM • NANCITOR; that is, if a man die intestate, leaving no natural heir who had been under his potestas, the nearest agnate, or relative tracing his connexion with the deceased exclusively through males, is to inherit the familia, or family fortune of every sort. Falling an agnate, a member of the gens of the dead man is to inherit. In a third sense, familia was applied to all the persons who could prove themselves to be descended from the same ancestor, and thus the word almost corresponded to our own use of it in the widest meaning, as when we say that a person is "of a good family" (Ulpian, Dig. 50, 1, 105 fn.).

1. Leaving for awhile the Roman terms, to which it will be necessary to return, we may provisionally define Family, in the modern sense, as the commonest or principal community of kinship. The union of one man with one woman, and by the increase of children born to them. These in modern times, and in most European countries, constitute the household, and it has been almost universally supposed that little natural associations of this sort are the germ-cell of early society. The Bible presents the growth of the Jewish nation from the one household of Abraham. His patriarchal family differed from the modern family in being polygamous, but, as female chastity was one of the conditions of the patriarchal family, and as descent through males was therefore recognized as certain, the plurality of wives makes no real difference to the argument. In the same way the earliest formal records of Indian, Greek and Roman society present the family as firmly established, and generally regarded as the most primitive of human associations. Thus, Aristotle derives the first household (οἰκία πατρίου) from the combination of man's possession of property—in the slave or in domesticated animals—with man's relation to woman, and he quotes Hesiod: ὃνοι μὲν πατρίας γυναῖκα τε βοῶν τ' ἄρτογημα (Politics, 1, 2, 5). The village, again, with him is a colony or offshoot of the household, and monarchical government in states is derived from the monarchy of the eldest male member of the family. Now, though certain ancient terms, introduced by Aristotle in the chapters to which we refer, might have led him to imagine a very different origin of society, his theory is, on the face of it, natural and plausible, and it has been almost universally accepted. The beginning of society, it has been said a thousand times, is the family, a natural association of kindred by blood, composed of father, mother and their descendants. In this family, the father is absolute master of his wife, his children and the goods of the little community; at his death his eldest son succeeds him; and in course of time this association of kindred, by natural increase and by adoption, develops into the clan, gens, or γένος. As generations multiply, the more distant relations split off into other clans, and these clans, which have not lost the sense of primitive kinship, unite once more into tribes. The tribes again, as civilization advances, acknowledge themselves to be subjects of a king, in whose veins the blood of the original family runs purest. This, or something like this, is the common theory of the growth of society.

2. It was between 1866 and 1880 that the common opinion began to be seriously opposed. John Ferguson McLennan, in his Primitive Marriage and his essays on The History of Exogamy (second series), drew attention to the wide prevalence of the custom of inheriting the kinship name through mothers, not fathers; and to the law of "Exogamy" (q.v.). The former usage he attributed to archaic uncertainty as to fatherhood; the natural result of absolute sexual promiscuity, or of Polyandry (q.v.). Either practice is inconsistent, prima facie, with the primitive existence of the Family, whether polygamous or monogamous, whether patriarchal or modern. The custom of Exogamy, again,—here taken to mean the unwritten law which made a man incur, and a capital offence, to marry within the real or supposed kin denoted by the common name of the kinship,—pointed to an archaic condition of family affairs all unlike our Table of prohibited degrees. This law of Exogamy was found, among many savage races, associated with Totems, that is plants, animals and other natural objects which give names to the various kindships, and are themselves, in various degrees, revered by members of the kindships. (See Totem and Totemism.)

Traces of such Kindships, and of Totemism, also of alleged promiscuity in ancient times, were detected by McLennan in the legends, folk-lore and institutions of Greece, Rome and India. Later, Prof. Robertson Smith found similar survivals, or possible survivals, among the Semitic races (Kinship in Early Arabia). Others have followed the same trail among the Celts (S. Reinach, Cultes, mythes et religions, 1904).

If arguments founded on these alleged survivals be valid, it may be that the most civilized races have passed through the stages of Exogamy, Totemism and reckoning descent in the female line. McLennan explained Exogamy as a result of scarcity of women, due to female infanticide. As women being scarce, the men of a group would steal them from other groups, and it would become shameful, and finally a deadly sin, for a man to marry within his own group-name, or name of kinship, say Wolf or Raven. Meanwhile, owing to scarcity of women, one woman would be the mate of many husbands (polyandry); hence, paternity being undetermined, descent would be reckoned through mothers.

Such are the outlines of McLennan's theory, which, as a whole, has been attacked by many writers, and is now, perhaps, accepted by none. McLennan's was the most brilliant of the flimsy work; but his supply of facts was relatively scanty, and his friend Charles Darwin stated objections which to many seem final, as regards the past existence of a stage of sexual promiscuity. C. N. Starcke (The Primitif Family, 1889), Edward Alexander Westermarck (History of Human Marriage, 1891), Ernest Crawley (The Mystic Rose), Herbert Spencer, Emile Durkheim, Lord Avebury and many others, have criticized McLennan, who, however, in coinng the term Exogamy, and drawing scientific attention to Totemism, and reckoning of kin through mothers, founded the study of early society. Here it may be said that "Matriarchate" (q.v.) is a misleading term, as is "Gynocracy," for the custom of deducing descent on the spindle side. Women among totemistic and exogamous savages are in a degraded position, nor does the deriving and inheriting of the kinship name, or anything else, on the spindle side, imply any ignorance of paternal relations; even where, as among Central Australian tribes, the facts of reproduction are said to be unknown.

3. Simultaneous with McLennan's researches and speculations were the works of Lewis H. Morgan. He was the discoverer of a custom very important in its bearing on the history of the human race, and very common in primitive races, in which addressing a kinsman do not discriminate between grades of relationship. All these grades are merged in large categories. Thus, in what Morgan calls the "Malayan system," "all consanguinei, near or far, fall within one of these relationships—grandparent, parent, brother, sister, child and grandchild." No other blood-relationships are recognized (Ancient Society). This at once reminds us of the Platonic Republic. "We devised means that no one should ever be able to know his own child, but that all should imagine themselves to be of one family, and should regard as brothers and sisters those who were within a certain limit of age; and those who were of an elder generation they were to regard as parents and grandparents, and those who were of a younger generation as children and grandchildren" (Timaeus, 18, Jowett's translation, first edition, vol. ii, 1871). This system prevails in the Polynesian groups and in New Zealand. Next comes what Morgan chooses to call the Turanian system. "It was universal among the North American aborigines," whom he styles Ganowanians. "Traces of it have been found in parts of Africa" (Ancient Society), and "it still prevails in South India among the Hindus, who speak the Dravidian languages" and also in North India, among other Hindus. The system, Morgan says, "is simply stupenduous." It is not exactly the same among all his miscellaneous "Turians," but, on the whole, assumes the following shapes. Suppose the speaker to be a male, he will style his nephew and
FAMILY

nie in the male line, his brother's children, "son" and "daughter," and his grand-nephews and grand-nieces in the male line, "grandson" and "granddaughter." Here the Turanian and the Malayan systems agree. But change the sex; let the male speaker address his nephews and nieces in the female line,—the children of his sister,—he salutes them as "nephew" and "niece," and they hail him as "uncle." Now, in the Malay system, nephews and nieces on both sides, brother's children or sisters, are alike named "children" of the uncle. If the speaker be a female, using the Turanian style, these terms are reversed. Her sister's sons and (sisters) sons by her as "son" and "daughter," her brother's children she calls "nephew" and "niece." Yet the children of the persons thus styled "nephew" and "niece" are not recognized in conversation as "grand-nephew" and "grand-niece," but as "grandson" and "granddaughter." It is impossible here to do more than indicate these features of the classificatory nomenclature, from which the others may be inferred. The reader is referred for particulars to Morgan's Systems of Consanguinity and Affinity of the Human Race.

The existence of the classificatory system is not an entirely new discovery. Nicolaus Damascenus, one of the inquirers into early society, who lived in the first century of our era, noticed this mode of address among the Galactophagi. Lactantius found it among the Iroquois. To Morgan's perception of the importance of the facts, and to his energetic collection of reports, we owe our knowledge of the wide prevalence of the system. From an examination of the degrees of kindred which seem to be indicated by the "Malayan" and "Turanian" modes of address, he has worked out a theory of the evolution of the modern family. A brief comparison of this with other modern theories will close our account of the family. The main points of the theory are shortly stated in Systems of Consanguinity, &c., and in Ancient Society. From the latter work we quote the following description of the five different and successive forms of the family:

1. The Consanguine Family. —It was founded upon the intermarriage of brothers and sisters, own and collateral, in a group.

2. The Punaluan Family. —It was founded upon the intermarriage of several sisters, own and collateral, with each other's husbands, in a group—the joint husbands not being necessarily kinsmen of each other; also, on the intermarriage of several brothers, own and collateral, with each other's wives in a group; these unions not being necessarily kindred to each other, although often the case in both instances (sic). In each case the group of men were conjointly married to the group of women.

3. The Patriarchal Family. —It was founded upon marriage between single pairs, but without an exclusive cohabitation. The marriage continued during the pleasure of the parties.

4. The Monogamous Family. —It was founded upon marriage between one man with several wives, followed in general by the seclusion of the wives.

5. The Consanguine System. —It was founded upon marriage between single pairs with an exclusive cohabitation.

Three of these forms, namely, the first, second, and fifth, were radical, because they were sufficiently general and influential to create three distinct systems of consanguinity, all of which still exist in living forms. Conversely, these systems are sufficient of themselves to prove the antecedent existence of the forms of the family, and of marriage with which they severally stand connected.

Morgan makes the systems of nomenclature proofs of the existence of the Consanguine and Punaluan families. Unhappily, there is no other proof, and the same systems have been explained on a very different principle (McLennan, Studies in Ancient History). Looking at facts, we find the Consanguine family notion, and cannot easily imagine how early groups abstained from intermarriage of brothers and sisters. St. Augustine, however (De civ. Dei, xvi, 16), and Archinus in his Theessalia (Odyssey, vii, 7, scolia B, Q) agree more or less with Morgan. Next, how did the Consanguine family change into the Punaluan? Morgan says (Ancient Society) brothers ceased to marry their sisters, because "the evils of it could not for ever escape human observation." Thus the Punaluan family was hit upon, and "created a distinct system of consanguinity" (Ancient Society), the Turanian.

Again, "marriages in Punaluan groups explain the relationships in the system." But Morgan provides himself with another explanation, "the Turanian system owes its origin to marriage in the group and to the gentile organization." He calls exogamy "the gentile organization," though, in point of fact, the only gentes we know, the Roman gentes, show scarcely a trace of exogamy. Again, "the change of relationships which resulted from substituting Punaluan in the place of Consanguine marriage turns the Malay into the Turanian system." On the same page Morgan attributes the change to the "gentile organization," and "the same theory supplies an explanation of their solution of the problem. Now, if the Punaluan marriage is a sufficient explanation, we do not need the "gentile organization." Both, in Morgan's opinion, were efforts of conscious moral reform. In Systems of Consanguinity the gentile organization (there called tribal), that is, exogamy, is said to have been "designed to work out a reform in the intermarriage of brothers and sisters." But the Punaluan marriage had done that, otherwise it would not have produced (as Morgan says it did) the change from the Malayan to the Turanian system, the difference in the two systems, as exemplified in Seneca and Tamil, being "in the relationships which depend on the intermarriage of brothers and sisters" (Ancient Society). Yet the Punaluan family, though itself a reform in morals and in "breeding," "did not furnish adequate motives to reform the Malay system," which, as we have seen, it did reform. The Punaluan family, it is suspected, "frequently involved own brothers and sisters"; had it not been so, there would have been no need of a fresh moral reformation,—"the gentile organization." Yet even in the Punaluan family (Ancient Society) "brothers ceased to marry their own sisters." What, then, did the "gentile organization" do for them? As they had already ceased to marry their own sisters, and as, under the gentile organization, they were still able to marry their half-sisters, the reformatory "ingenious" of the inventors of the organizations was at once superfluous and useless. It is impossible to understand the Punaluan system. Its existence is inferred from a system of nomenclature which it does (and does not) produce; it admits (and excludes) own brothers and sisters. Morgan has intended, apparently, to represent the Punaluan marriage as a long transition to the definite custom of exogamy, but it will be seen that his language is not very clear nor his positions assured. He does not adduce the cases of the families of the "gentile organization" (as, for instance, the Kátilorí or Kátilorí, institution, even in Hawaii. There is, if possible, a greater absence of historical testimony to the existence of the Consanguine family. It is difficult to believe that exogamy was a conscious moral and social reformation, because, ex hypothesi, the savages had no moral data, nothing to cause disgust at relations which seem revoltmg to us. It is as improbable that they discovered the supposed physical evils of breeding in and in. That discovery could only have been made after a long experience, and in the Consanguine family that experience was impossible. Thus, setting moral reform adás aside inconceivable, we cannot understand how the Consanguine families ever broke up. Morgan's ingenious speculations as to a transitional step towards the gens (as he calls what we style the totem-kindred), supposed to be found in the "classes" and marriage laws of the Kátilorí, are vitiated by the weakness and contradictory nature of the evidence (see Pritchard; J. D. Lang's Queensland, Appendix; Proceedings of American Academy of Arts, &c., vol. viii. 415; Nature, October 20, 1874). Further, though Morgan calls the Australian "gentile organization" "incipient," he admits (Ancient Society) that the Narrinyeri have totem groups, in which "the children are of the same genus or from being "incipient," the gens of the Narrinyeri is on the footing of the ghotra of Hindu custom. Lastly, though Morgan frequently declares that the Polynesians have not the gens (for he thinks them not sufficiently advanced), W. W. Gill (Myths and Songs from the South Pacific, London, 1876) has shown that unmistakable traces of the totem survive in Polynesian mythology.

4. Morgan's theory was opposed by McLennan (Studies in Ancient History, 1876), who maintained that the names for
relationships, in the "classificatory system," were merely terms of address, as among ourselves when a preacher calls any adult male "brother," when an old woman is addressed as "mother," when an elder man calls a junior "my son." He also shows that his own system accounted for the terms.

The controversy is still alive; one set of writers regarding the savage terms of relationship as indicating a state of things in which human beings dwelt in a "horde," with promiscuous intercourse; another set holding that the terms do not indicate consanguineous kinship, but degrees of age, status, and reciprocal obligations in a local tribe, and therefore that they do not yield any presumption that there was a past of promiscuity or of what is called "group marriage." On Morgan's side (not of course accepting all his details) are L. Fison and A. W. Howitt, and Baldwin Spencer and F. J. Gillen. Against him are Starcké, Westermack, A. Lang, Dr Durkeim, apparently, Crawley and many others.

5. A second presumption in favour of original promiscuity has been drawn by the eminent Australian students, Baldwin Spencer and F. J. Gillen, and by A. W. Howitt, from the customs of some Australian aborigines. In each tribe, owing to customary laws which are to be examined later, only men and women of a given status are intermarriageable (\textit{maapa, noa, andauw}) with each other. Though child-betrotals are usual, and though the woman is specialized to one man, who protects and nourishes her and all her children, and though their union is immediately preceded by an extended \textit{fus primae noctis} (such as Herodotus describes among the Nasamones), yet, among certain tribes, the following custom prevails. At great meetings the tribal leaders assign a woman as a paramour (with what amount of permanence remains obscure) to a man (pirrauru); one man may have several pirrauru men, one man several pirrauru women, in addition to their regularly betrothed (\textit{tippa malku}) wives and husbands. The husband occasionally shows fright, and bitter jealousies prevail, but, at the great ceremonial meetings, compliance is enforced under penalty of strangling. Thenceforth, if the husband permits, the male pirrauru has matrimonial rights over the other man's tippa malku wife when they meet. A symbolic ceremony of union precedes the junction of the pirrauru people. This institution, as far as reported, is peculiar to a group of tribes near Lake Eyre, the Dieri, Urubunna, and their congeners, or perhaps to all who have the same "phratry" names as the Dieri and Urubunna (Kiraru and Mataara, in various dialectic forms).

Elsewhere the pirrauru custom is not known: but almost everywhere there are licentious festivals, in which all marriage rules except those which forbid incest (in our sense of the word, namely between the closest relations) are thrown to the winds. Also a native marriage is almost always a choice of the sexual organs of beasts of licence, or Saturnalia, which have their analogies among many people, ancient and modern. Pirrauru is no more a survival of and a proof of primitive promiscuity, than is the legalized incest of ancient Egypt or ancient Peru. If these views be correct the argument for primitive promiscuity derived from pirrauru falls to the ground.

6. The questions at issue obviously are, was mankind originally promiscuous with no objections to marriage between persons of the nearest kin; and was the first step in advance the prohibition of marriage (or of amatory intercourse) between brothers and sisters; or did mankind originally live in very small groups, under a jealous sire, who imposed restrictions on intercourse between the young males, his sons, and all the females of the "hearth-circle," who constituted his harem? The problem has been studied, first, in the institutions of savages, notably of the most backward savages, the black natives of Australia; and next, in the light of the habits of the higher mankind.

As regards Australian matrimonial institutions, it has been known since the date of the \textit{Journals of two Expeditions of Discovery}, by Sir George Grey (1837-1839), that they are very complex and peculiar, in points strongly resembling the customary laws of the more backward Red Indian tribes of North America. Information came in, while McLennan was working, from G. Taplin (\textit{The Narrinyeri}, 1874), from A. W. Howitt and L. Fison, and many other inquirers (in Brough Smyth's \textit{Aborigines of Victoria}, 1898), from Howitt and Fison again (in \textit{Kimaroi and Kurnai}, 1880), and many essays by these authors, and finally, in \textit{North-West Central Tribes of Australia} (1899) and \textit{Northern Tribes of Central Australia} (1904), by Baldwin Spencer and F. J. Gillen; and in Howitt's \textit{Native Tribes of South-East Australia} (1904), with R. Roth's \textit{North-West Central Queensland Aborigines} (1897). All of these are works of very high merit. Knowledge is now much more wide, minute and securely based than it was when McLennan's \textit{Studies in Ancient History}, second series, was posthumously published (1890). We know with certainty that in Australia, among archaic savages who have neither metals, agriculture, pottery nor domesticated animals, a graduated scale of matrimonial institutions exists. First there are local tribes, each tribe having its own dialect; holding a recognized area of territory; and living on friendly terms with neighbouring tribes. Territorial conquest is never attempted. In many cases a knot of tribes of allied dialects and kindred rites may be, or at least is, spoken of as a "nation" by our authorities.

7. Customary law is administered by the Seniors, the wise, the magically skilled, who in many cases are "headmen" of local groups or of sets of kindred. As to marriage, primitive persons may wed within the local tribe, or into a neighbouring local tribe, at will, provided that they observe the restrictions of customary law. The local tribe is neither exogamous nor endogamous, any more than is an English county. The restrictions, except where they have become obsolete, fall into six main categories:

(i) In the most primitive, each tribe consists of two intermarrying and exogamous divisions, which are often styled \textit{phratries}. Each such division has a name, which, when it can be translated, is the name of an animal: in the majority of cases, however, the meaning of the phratry name is lost. In one instance, that of the Eualhlay tribe of north-west New South Wales, the phratry names are said (by Mrs Langlois Parker) to mean "Light Blood" and "Dark Blood.

(ii) In the theory of the Rev. J. Mathews, Eagle and Crow, might be taken to indicate a blending of two distinct races.

(iii) For the sake of clearness, tribes whose phratry names mean "Crow" and "Eagle Hawk," every member of the tribe belongs to the Eagle Hawk phratry or to Crow phratry: if to Crow, the man or woman can only marry an Eagle Hawk, if to Eagle Hawk, can only marry a Crow. The children invariably belong to the phratry of the mother, in this most primitive type. Within Eagle Hawk phratry is one set of totem kin, named usually after various species of animals and plants; within Crow phratry is another set of totem kin, named usually after various species of animals and plants (except in one region of Central Australia) after a \textit{different} set of plants and animals. With the exception mentioned (that of the Arunta
"nation"), in no tribe does the same totem ever occur in both phratries. Totems and totem names are inherited by the children from the mother, in this primitive type. Thus a man, Eagle Hawk by phraternity, may marry his woman Crow by phraternity, Black Duck by totem. His children by her are of phraternity Crow, of totem Black Duck. Obviously no person can marry another of his or her own totem, because, in the phraternity into which he or she must marry, no man or woman of his or her totem exists. The prohibition extends to members of alien and remote tribes, if of the same totem name.

The same rules exist in the more primitive North American tribes, but as the phraternity there has generally, though not always, decayed, the rule, where this has occurred, merely forbids marriage with one's own totem. It is said that in the Kambiri a man who marries his mother is said to be "kbi.

(2) We find this type of organization, where the child inherits phraternity and totem from the father, not from the mother.

(3) We find tribes in which phraternity and totem are inherited from the mother, but an additional rule prevails: the rule of "Matrimonial Classes." By this device, in phraternity "Dilbi," there are two classes, "Muri" and "Kubi." In phraternity "Kupathin" are two classes, "Ipai" and "Kumbo" (all these names are of unknown meaning). Each child inherits its mother's phraternity name and totem name, and also the name of that class of the two in the mother's phraternity to which the mother does not belong. No person may marry into his or her own class—practically into his or her own generation: the rule makes parental and filial marriages impossible—but these never occur even among more primitive tribes which have not the institution of classes. Suppose that the class names are really names of animals and other objects in nature—as in a few cases they actually are. Then the rules, where classes exist, would amount to this: no person may marry another who, by phraternity, totem or generation, owns the same hereditary animal name as himself or herself. In practice, where phratries exist, a man who knows a totem and a phraternity name knows whether or not he may marry her. Where class names exist (even though the totem name be lost), a man who knows a woman's class name knows whether or not he may marry her. Nothing can be simpler in practice.

(4) The same rules as under (3) exist, but the phraternity, totem and class are inherited through the father: the class of the child of course not being the father's, but the linked class in his phraternity.

(5) In the fifth category (Central North Australia), while phraternity name (if not lost) and totem name are inherited from the father, by a refinement of law which is spreading southwards there are four classes in each phraternity (or more exogamous division unnamed), and the choice of a partner in life is thus more restricted than in more primitive tribes.

(6) Finally we reach the institutions of the group of tribes called from the name of the most powerful tribe in the set, "the Arunta nation." They occupy the Macdonnell Ranges and other territory in the very centre of Australia. The Arunta reckon kinship in the male line: their phraternity names they have forgotten, in place of phratries eight matrimonial classes regulate marriage. In these respects they resemble most of the central and northern tribes, but present this unique peculiarity, that the same totems may and do exist in both of the opposed intermarrying exogamous divisions consisting of four classes each. It thus results that a man, in the Arunta tribe, may marry a woman of his own totem, if she be in the class with which he may intermarry. This licence is unknown in every other part of the totemic world, and even in the Kaitish tribe of the Arunta nation intertotemic marriages, in practice, almost never occur.

Among the Arunta the totems are only prominent in magical ceremonies. There are four classes in South-Eastern Australia. At these ceremonies (Intichuma) the men of the totem do co-operative magic for the benefit of their plant or animal, as part of the tribal food-supply. The members of the totem taste sparingly on these occasions, apparently under the belief that to do so increases their magical power: the rest of the tribe eat freely. But, as far as denoting kinship or regulating marriage is concerned, the totems, among the Arunta, have no legally important existence. Men and women of the same totem may intermarry, their children need not belong to the totem of either father or mother.

The process by which Arunta totems came thus to differ from those of all other savages is easily understood. Like the other tribes from the centre to the north (including the Urabunna nation, which reckons descent through women), the Arunta believe that the souls of the primal semi-bestival ancestors of the Alcheringsa or "dream time" are perpetually reincarnated. This opinion does not affect by itself the usual exogamous character of totemism among the other tribes. The Arunta nation, however, cultivates an additional myth, namely that the primitive ancestors, when they first occupied the land inhabited them certain oval stone slabs, with archaic markings, called churinga nanja, or "sacred things of the nanja." The nanja, again, is a tree or rock, fabled to have risen up to mark the spot where a group of primal ancestors, all of one and the same totem in each case (Cats here, Grubs there, Ducks elsewhere), "went into the ground." The souls of these ancestors haunt such spots, especially they haunt the nanja tree or rock, and the stone churinga nanja. Each district, therefore, has its own oknanikilla (or local totem centre of the ghosts), Cat ghosts, Grub ghosts, Duck ghosts, etc. These ghosts and their nanjas are confined and are reborn as children. When a child comes to birth, the mother names the oknanikilla in which she conceived it, and, whatever the ghost totem of that place may be, it is the child's totem. Its mother may be a Grub, its father may be a Crow, but if the child was conceived in a Duck, or Cat, or Opossum or Kangaroo locality, it is, by totem, a Cat, Opossum, Duck or Kangaroo. The churinga nanja of its primal ancestor is sought for at the place of the child's conception, and is put into the sacred repository of such objects.

Thus the child does not inherit its totem from father, or from mother, but from the totem which its mother's maternal grandfather, that is, her father's father, does inherit the right to do ceremonies for the paternal totem: a proof that, of old, totems were inherited, as elsewhere, and that in the male line. If totems among the Arunta, as everywhere else, were once arranged on the plan that the same totem never occurs in both exogamous moieties, that arrangement has been destroyed, as was inevitable, by the existing method of allotting totems to children,—not by inheritance,—but at haphazard. By this means (a consequence of the unique Arunta belief about churinga nanja) the same totems have got into both exogamous moieties, so that persons of the same totem, but of appropriate matrimonial class, may marry (or at least have common ancestors, for in the other division the name of the totem is unknown), and the choice of a partner in life is thus more restricted than in more primitive tribes.

The whole system is impossible except where descent is reckoned in the male line, for there alone is local totemism possible, and the Arunta system is based on local totemism, plus the churinga nanja and reincarnation beliefs. With reckoning of descent in the female line, no locality can possibly have its local totem: all the totems indiscriminately distributed everywhere; and thus no woman can say in what totemic locality her child was conceived, for there is not and cannot be, with female descent, any totemic locality. Now it is admitted that reckoning by female descent is the earlier method, and it is granted that in rites and ceremonies the Arunta are of a relatively advanced and highly organized pattern. Their social organization is local, and they have a kind of local magistracies, hereditary in the male line.

In spite of these facts, Spencer and Gillen conceive that the peculiar totemism of the Arunta is the most primitive type extant (cp. Spencer, J.A.I. (N.S.), vol. i. 273-281; and Frazer, ibid. 281-288). It is not easy to understand this position, as, without male kinship and consequent totemic system (which is not primitive), and without the churinga nanja (which exist only in a strictly limited area), the Arunta system of non-exogamous totems cannot possibly exist. Again, the other tribes cannot have passed through the Arunta stage, for, if they had, their totems would have existed, as among the Arunta, in both exogamous moieties, and would there remain when they came to be inherited;
so that the totems of all these tribes would still be non-exogamous, like those of the Arunta. But this is not the case. Once more, it is clear that the Arunta system has but recently reached their neighbours, the Kaitish, for though they have the churinga name belief, and the haphazard method of acquiring totems by local accident, these things have not yet overcome the old traditional reluctance to marry within the totem name. It is not unlawful among the Kaitish; but it is hardly ever done.

Despite these objections, however, Spencer and Gillen hold, as we have said, that, originally, there were no restrictions (or no known restrictions) on marriage. Totems were merely the result of the formation of co-operative magical societies, in the interest of the tribal food supply. Then, in some unknown way, regulations as to marriage were introduced for some unknown purpose, or were involved in some manner not understood. The traditions of the Arunta," says Spencer, "point to a very definite introduction of an exogamous system long after the totemic groups were fully developed—and, further, they point very clearly to the fact that the introduction was due to the deliberate action of certain ancestors. Our knowledge of the natives leads us to the opinion that it is quite possible that this really took place, that the exogamic groups were deliberately introduced so as to regulate marital relations."

Thus the wisdom of men living promiscuously as regards marriage, but organized in magical societies for the benefit of the common food supply of the local tribe (a complex institution postulated as already in being at this early stage), induced them to introduce a law that they harm they saw in their promiscuity, we are not informed. Spencer goes on, "by this we do not mean that the regulations had anything whatever to do with the idea of incest, or of any harm accruing from the union of individuals who were regarded as too nearly related. . . . There was felt the need of some kind of organization, and this gradually resulted in the development of exogamous groups." But as "it is quite possible that the exogamous groups were deliberately introduced to regulate marital relations," and as they could only do so by introducing exogamy, we do not see how that system can be the result of the gradual development of an organization quebecing to an unknown nature. A magical organization already existed (Journal of the Anthropological Institute, New Series, i. pp. 284-285).

The traditions of the Arunta seem here to be first accepted: "quite possibly" they are correct in stating that an exogamic system was purposefully introduced, long after totemic groups had arisen, by "the deliberate action of certain ancestors," and then that myth is rejected, in favour of the gradual development of exogamy, "out of some form of organization," unknown.

People who, like the Arunta, have lost memory of the very nature of the phratries, cannot conceivably remember the nature of the origin of exogamy, how it was changed as they now are to tribal councils which introduce new rules, they fancy that, in the beginning, new rules were thus introduced.

Meanwhile the working of magic for the benefit of the totem animals and plants, or rather for the name-giving animals of magical societies, is not known to Howitt among the tribes of primitive social organization, while it is well known among agricultural natives of the Torres Strait Islands and among the advanced Sioux and Omaha of North America. The practice seems to belong rather to the decadence than to the dawn of totemism. On the whole, then, there seems to be insurmountable difficulties in the way of Spencer's hypothesis that mankind were promiscuous, as regards marriage, but were organized into co-operative magical groups, athwart which came, in some unexplained way, the rule of exogamy; while, when it did come, all savages except the Arunta arranged matters so that totem kins were exogamous. The reverse was probably the case, totem kins were originally exogamous, and ceased to be so, and even to be kins among the Arunta, in consequence of the change of the totemic creed, becoming co-operative magical societies (Hartland, MacArthur, and others).

8. Spencer and Gillen leave the origin of exogamy an open question. Howitt supposes that, in the shape of the phratriic division of the tribe into two exogamous moieties, the scheme may have been introduced to the tribal headmen by a medicine man "announcing to his fellow headman a command received from some supernatural being . . ." (Natives of South-East Australia, pp. 50, 90). The Council is to speak, of "headmen" accept the divine decree, and the assembled tribe pass the Act. But this explanation explains nothing. Why did the prophet wish to introduce exogamy? Why were names of animals given, in so many cases, to the two exogamous divisions? As Howitt asks (op. cit. p. 153), "How was it that men assumed the names of objects, which in fact must have been the commencement of totemism?"

It is apparent that any theory which begins by postulating the existence of early mankind in promiscuous groups or hordes, into which exogamous moieties are introduced by tribal decree, takes for granted that the tribe, with its headman, councils and great meetings (not to mention its inspired prophet, with the tribal "All Father" who inspires him), existed before any rules regulating "marital relations" were evolved. Even if all this were probable, we are not told why a promiscuous tribe thought good to establish exogamous divisions. Some native myths attribute the institution to certain wise ancestors; some to the supernatural "All Father," say Baines; some to a treaty between Eagle Hawk and Crow, beings of cosmogonic legend, who give names to the phratries. Such myths are mere hypotheses. It is impossible to imagine how early savages, "ex hypothesi" promiscuous, saw anything to reform in their state of exogamy. They do not think certain unions wrong, because they are forbidden: they were not forbidden, originally, because they were thought wrong.

Westermarck has endeavoured to escape the difficulty thus: "Among the ancestors of man, as among other animals, there was no doubt a time when blood relationship was no bar to sexual intercourse. But variations here, as elsewhere, would naturally present themselves, and those of our ancestors who avoided in and in breeding would survive," while the others would die out. This appears to be orthodox evolutionary language, but it carries us no further. Human societies are not animals or plants, in whose structures various favourable "accidents" occur, producing better types, which survive. We ask why in human society did "variations present themselves"; why did certain sets of human beings "avoid in and in breeding"? We are merely told that some of our ancestors became exogamous and survived, while others remained promiscuous and perished. No light is thrown on the problem,—wherefore did some of our ancestors avoid in and in breeding, and become exogamous? Nothing is gained by saying "thus an instinct would be developed which would be powerful enough, as a rule, to prevent incestuous unions." There is no "instinct," there is a tribal law of exogamy. If there had been an "instinct," it might account for the avoidance of "in and in breeding"—that is, it might account for exogamy, ab initio. But that is left unaccounted for by the theory which, after maintaining that the avoidance produced the instinct, seems to argue that the instinct produced the avoidance. Westermarck goes on to say that "exogamy, as a natural extension of the instinct, would arise when single families united in small hordes. . . . But, if the single families already had the 'instinct,' they would not marry within the family: they would be exogamous,—" before they were "united in small hordes." The difficulty of accounting for exogamy does not seem to have been overcome, and no attempt is made to explain the animal names of totem kins and phratries. Westermarck, however, says that "there is no reason why we should assume, as so many anthropologists have done, that primitive men lived in small endogamous groups, practising incest in every degree," although, as he also says, "there was no doubt a time when blood relationship was no bar to sexual intercourse.

If there was no bar, people would "practise incest in every degree,"—what was there to prevent them? (History of Human Marriage, pp. 322, 353 (1891)).
So far we have seen no luminous and consistent account of how mankind became exogamous, if they began by being promiscuous. The theories rest on the idea that man, dwelling in an "undivided horde" (except so far as it was divided into co-operative magical societies), became it into two exogamous intermarring societies. Durkheim founded for him a theory which is not at all points easily understood. He supposes that, "at the beginning of societies of men, incest was not prohibited ... before each horde (peuple) divided itself into two primitive 'clans' at least" (L'Année sociologique, i. pp. 62, 63). Each of the two "clans" claimed descent from a different animal, which was its totem, and its "god." The two clans were exogamous, — out of respect to the blood of their totem (with which every member of the clan is mysteriously one), and, being hostile, the two clans raided each other for women. Each clan threw off colonies, which took new totems, new "gods," though still owning some regard to their original clan, from which they had seceded, while abandoning its "god." When the two "primary clans" made alliance and connubium, they became the phratries in the local tribe, and their colonies became the totem kins within the phratries.

We are not told why the original horde was disrupted into two hostile and intermarring "clans": we especially wonder why the horde, if it wanted an animal god, did not choose one animal for the whole community; and we may suspect that a difference of taste in animal "gods" caused the hostility of the two clans. Nor do we see what, if things occurred thus, the totem kind should not represent twenty or thirty differences of religious taste, in the original horde, as to the choice of animal gods. If the horde was going to vary in opinion, it is unlikely that only two factions put forward animal candidates for divinity. Again, a "clan" (a totem kin, with exogamy and descent derived through mothers) cannot overflow its territorial area and be therefore obliged to send out colonies, for such a clan (as Durkheim himself remarks) has no territorial area to overflow. It is not a local institution at all.

While these objections cannot but occur, Durkheim does provide a valuable reason for the existence of exogamy. When once the groups (however they got them) had totems, with the usual taboos on any sort of use of the totem by his kinsfolk, the women of the kin would be tabooed to the men of the same kin. In marrying a maiden of his own totem, a man inevitably violates the sanctity of the blood of the totem (L'Année sociologique, i. pp. 47-57). Cf. Reinhac, Cultes, mythes et religions, vol. i. pp. 162-165.

Here at last we have a theory which accounts for the "religious horror" that attaches to the violation of the rule of totemic exogamy: if any intermarry, the totem, is hereby disrupted, and its limits are ended. But how did totems, animals, and animal names come on to be mystically solidaires with their human namesakes and kinsmen? We do not observe that Dr Durkheim ever explains why two divisions of one horde chose each a different animal god, or why the supposed colonies thrown off by these primary clans deserted their animal gods for others, or why, and on what principle, they all chose new "gods," — fresh animals, plants and other objects. His hereditary totem is, in practice, the last thing that a savage changes. The only case of change on record is a recent attempt to increase the range of legal marriages in a waning Australian tribe, on whose lands certain species of animals are perishing.

Theories based on a supposed primordial state of promiscuity certainly encounter, when explaining the social organization of Australian savages, difficulties which they do not surmount. But Howitt has provided (apparently without fully realizing the merit of his own suggestions) a way out of the perplexities caused by the conception of early mankind dwelling promiscuously in "undivided communes." The way out is practically to say that, in everyday life, they lived in nothing of the sort. Howitt writes (Native Tribes of South-East Australia, p. 173): "A study of the evidence has led me to the conclusion that the state of society among the early Australians was that of an 'Undivided Commune.' .. It is, however, well to guard this expression. I do not desire to imply necessarily the existence of complete and continuous communism between the sexes. The character of the country, the necessity of moving from one point to another in search of game and vegetable food, would cause any Undivided Commune, perhaps at assumed dimensions greater than this immediate locality could provide with food, to break up into two or more Communes of the same character. In addition to this it is clear .. that in the past as now, individual likes and dislikes must have existed, so that, admitting the existence of common rights between the members of the Commune, these rights would remain in abeyance, so far as the separated parts of the Commune were concerned. But at certain gatherings .. or on great ceremonial occasions, all the segments of the original Commune would reunite, and would behave in the fashion now common in great licentious festivities meetings.

In the early ages contemplated, how can we postulate "great ceremonial occasions" or even peaceful assemblies at fruit-bearing spots? How can we postulate a surviving Primitive sense of solidarity among the scattered segments of the Commune, obviously very small, owing to lack of improvable supplies, and perpetually disintegrated? But, taking the original groups as very small, and as ruled by likes and dislikes, by affection and jealousy, we are no longer concerned with a promiscuous horde, but with a little knot of human beings, in whom love, parental affection and the jealousy of sires, would within the limits of totemic communities, and the laws of that person, as regards sexual privileges. Thus we have edged away from the hypothesis of the promiscuous indiscriminating horde to the opinion of Darwin. "We may conclude," he says, "from what we know of the jealousy of all male quadrupeds, armed as many of them are with special weapons for battling with their rivals, that promiscuous intercourse in a state of Nature is extremely improbable. .. The most probable view is that Man originally lived in small communities, each (man) with a single wife, or, if powerful, with several, whom he jealously guarded against other men. But, in a community of this early type, to guard women jealousy would mean constant battle, at least when Man became an animal who makes love all the year round. So Darwin adds: 'Or man may not have been a social animal, and yet have lived with several wives, like the Gorilla,—for all the natives agree that but one adult male is seen in a band; when the young male grows up a contest takes place for the mastery, and the strongest, by killing or driving out the others, establishes himself as head of the Community. Younger males, being thus expelled and wandering about, would, when at last successful in finding a partner, prevent too close interbreeding within the limits of the same family' (Descent of Man, i. pp. 361, 363 (1871)).

Here, then, we have practical Exogamy, as regards unions of brothers and sisters, among man still brutish, while the Sire is husband of the whole harem of females, probably unchecked as regards his daughters.

On this Darwinian text J. J. Atkinson builds his theory of the evolution of exogamy and of savage society in his Primal Law (Social Origins and Primal Law, by Lang and Atkinson, 1903). Paternal jealousy "gave birth to Primal Law, prohibiting marriage between certain members of a family or local group, and thus, in natural sequence, led to forced consensual selection beyond its circle, that is, led to Exogamy .. as a habit, not as an expressed law. .." The "expressed law" was necessarily a later development; conditioned by the circumstances which produced totemism, and sanctioned, as on Durkheim's scheme, by the totemic taboo. Atkinson worked out his theory by a minute study of customs of avoidance between near kin by blood or affinity; by observations on the customs of animals, and by hypotheses as to the very gradual evolution of human restrictions through many modifications. He also gave a theory of the "classification" system of names for relations, analogous to that of Morgan. The "names are here used "on reference to relativity of age of a class in relation to the group." The exogamous moieties of a tribe (phratries) are not
FAMILY 165

the result of a reformatory legislative bisection of the tribe, but of the existence of "two intermarrying totem clan groups." The whole treatise, allowing for defects caused by the author's death before the book was printed, is highly original and ingenious. The author, however, did not touch on the evolution of totemism.

9. The following system, as a means of making intelligible the evolution of Australian totemic society, is proposed by the present writer. We may suggest that men originally lived in the state of "the Cyclopean family, containing but one adult male, with the females, the adolescent males being driven out, to find each a female mate, or mates, elsewhere if they can. With increase of skill, improvements in implements and mitigation of ferocity, such groups may become larger, in a given area, but men may retain the habit of seeking mates outside the limits of the group of contiguity; the "avoidance" of brothers and sisters may already have arisen. Among the advanced Arunta, now, a man may speak freely to his elder sisters; to younger sisters, or "tribal sisters," he may not speak, or only at such a distance that the features are indistinguishable. To these rules of avoidance would be a step facilitating the permission to adult males to dwell in their paternal group, avoiding their sisters. Such groups, whether habitually exogamous or not, will require names for each other, and various reasons would yield a preference to names derived from animals. These are easily signalled in gesture language; are easily presented in pictograms and tattooing; are even now, among savages and boys, the most usual sort of personal nicknames; and are widely employed as group names of villagers in European folk-lore. Among European rustic such group sobriquets are usual, but are represented by the savage, with his ideas of the equality or superiority of animals to himself, seeing nothing to resent in an animal sobriquet, and the names, originally group sobriquets, would not find more difficulty in being accepted than "Whig," "Tory," "Huguenot," "Cavalier," "Christian," "Cameronian," —all of them originally nicknames given from without. Again, "Wry Nose" and "Crooked Mouth" are derivitive nicknames, but they are the translations of the ancient Celtic clan names Cameron and Campbell. The nicknames "Naked Dogs," "Liars," "Buffalo Dung," "Men who do not laugh," "Big Topknots," have been thoroughly accepted by the "gents of the Blackfoot Lodge Tales, pp. 208-225.

As Howitt writes, "the assumption of the names of objects by men must in fact have been the origin of totemism." Howitt does not admit the theory that the totem names came to arise in this way, but this way is a vera causa. Names must be given either from within or from without. A group, in savagery, has no need of a name for itself; "we" are "we," or are "The Men"; for all other adjacent groups names are needed. The name of one totem, Thalassa, "The Laughing Boy" totem, among the Warramunga and another tribe, is quite transparently a nickname, as Kari, "The Grown-up Men" (Spencer and Gillen, Northern Tribes of Central Australia, p. 207).

There is nothing, prima facie, which renders this origin of animal, plant and other such names for early savage groups at all improbable. They would not even be resented, as now are the animal names for villagers in the Orkneys, the Channel Islands, France, Cornwall and in ancient Israel (for examples see Social Origins, pp. 293-301). The names once accepted, and their origin forgotten, would be inevitably regarded as implying a mystic rapport between the bestial and the human namesakes, Crow, Eagle Hawk, Grub, Bandicoot, Opossum, Emu, Kangaroo and so on (see NAME). On this subject it is enough to cite J. G. Frazer, in The Golden Bough (2nd ed., vol. i. pp. 404-446). Here will be found a rich and satisfactory collection of proof that community of name implies mystic rapport. Professor Rhys is quoted for the statement that probably "the whole Aryan race believed at one time not only that the name was a part of the man, but that it was that part of him which is termed the soul." In such a mental stage the men "Crows," identify themselves with the actual Crow species: the birds are now "of their flesh," are fabled to be their ancestors, or the men have been evolved out of the birds. The Crow is sacro-sanct, a friend and protector, and a centre of taboos, one of which is the prohibition preventing a Crow man from intercourse with a Crow woman, "however far apart their hunting grounds may have been." All men and women Crows are recognized as brothers and sisters in the Crow, and are not intermarriages.

On these lines the prohibition to infringe the totem taboo by marriage within the totem name is intelligible, but the system of phratries has yet to be accounted for. It is obvious that the names could only have been given originally to local groups: the people who held this or that local habitation received the name. Suppose that the rule of each such group, or heart circle, had been "no marriage within the local group or camp," as in Atkinson's scheme. When the groups accept their new names, the rule becomes, "no marriage within local group Eagle Hawk, group Crow," and so on. So far the animal giving the group name may not yet have become a revered object. The result of the rule would inevitably be, in three or four generations, that in groups Crow or Eagle Hawk, there were no Crows or Eagle Hawks by descent, if the children took the names of descent from their mothers; for the sake of differentiation: the Ant woman's children in local group Crow being Ants, the Grub woman's children being Grubs, the Eagle Hawk woman's children being Eagle Hawks,—all in local group Crow, and inheriting the names of the local groups whose mothers were brought into local group Crow. By this means (indicated first by McLennan) each member of a local group would have a local group name, say Eagle Hawk, and a name by female descent, say Kangaroo, in addition, as now, to his or her personal name. In this way, all members of each local group would find, in any other local group, people of his name of descent, and, as the totem belief grew to maturity, kinsmen of his in the totem. When this fact was realized, it would inevitably make for peace among all contiguous groups. In place of taking women by force, at the risk of shedding kindred blood, peaceful betrothals between men and women of different local group names and of different names by descent could be arranged. Say that local groups Eagle Hawk and Crow took the lead in this arrangement of alliance and cannibalism, so that they, in the natural growth in the strength conferred by union) the other local groups came into it, ranging themselves under Eagle Hawk and Crow, we should have the existing primitive type of organization: Local Groups Eagle Hawk (Mukwara) and Crow (Kilpara) would have become the widely diffused phratries, Mukwara and Kilpara, with all the totem kins within them.

But, on these lines, some members of any totem kin, say Cat, would be in phratri Eagle Hawk, some would be in phratri Kilpara as now (for the different reason already indicated) among the Arunta. Such persons were in a quandary. By phratry law, as being in opposite phratries, a Cat in Eagle Hawk phratri could marry a Cat in Crow phratri. But, by totem law, this was impossible. To avoid the clash of law, all Cats had to go into one phratri or the other, either into Eagle Hawk or into Crow.

Two whole totem kins were in the same unhappy position. The persons who were Eagle Hawks by descent could not be in Eagle Hawk local group, now phratri, as we have already shown. They were in Crow phratri, they could not, by phratri law, marry in their own phratri; and to marry in Eagle Hawk was to break the old law, "no marriage within the local group name." Their only chance was to return to Eagle Hawk phratri, while Crow totem kin went into Crow phratri, and thus we often find, in fact, that in Australian phratries Mukwara (Eagle Hawk) there is a totem kin Eagle Hawk, and in Kilpara phratri (Crow) there is a totem kin Crow. This arrangement—the totem kin within the phratri of its own name—has long been known to exist in America. The Thinkets have Raven phratri, with totem kins Raven, Frog, Goose, &c., and Wolf phratri, with
FAMINE

totem kins Wolf, Bear, Eagle, &c. (Frazer, Totemism, pp. 61, 62 (1887)). In Australia the fact has hitherto escaped observation, because so many phratry names are not translated, while, though Mukauro and Kilpara are translated, the Eagle Hawk and Crow totem kins within them bear other names for the same birds, more recent names, or tribal native names, such as Billembilla and Wany, while Mukauro and Kilpara may have been names borrowed, within the institution of phratry, from some alien tribe now perhaps extinct.

We have now sketched a scheme explanatory of the most primitive type of social organization in Australia. The tendency is for phratry first to lose the meanings of their names, and, next, for their names to lapse into oblivion, as among the Arunta; the work of regulating marriage being done by the opposed Matrimonial Classes.

These classes are obviously an artificial arrangement, intended to restrict marriage to persons on the same level as generations. The meanings of the class names are only known with certainty in two cases, and then are names of animals, while there is reason to suspect that animal names occur in four or five of the eight class-names which, in different dialect forms, prevail in central and northern Australia. Conceivably the new class regulations made use of the old totemic machinery of nomenclature. But until Australian philologists can trace the original meanings of Class Names, further speculation is premature.

10. Much might be said about the way out of totemism. When once descent and inheritance are traced through males, the totem of totemism begins to break up. One way out is the Arunta way, where totems no longer designate kinship. In parts of America totems are simply fading into heraldry, or into magical societies, while the "gente," once totemic, have acquired new names, often local, as among the Sioux, or mere sobriquets, as among the Blackfeet. In Melanesia the phratry, whether named or nameless, have survived, while the totems have left but a few traces which some consider disputable (Social Origins, pp. 176-184). Among the Bantu of South Africa the tribes have sacred animals (Sihoko), which may be survivals of the totems of the chief local totem group, with male descent in the tribe, the whole of which now bears the name of the sacred animal. Even in Australia, among tribes where there is reckoning of descent in the male line, and where there are no matrimonial classes, the tendency is for totems to dwindle, while exogamy becomes local, the rule being to marry out of the district, not out of the kin (Howitt, Native Tribes of South-East Australia, pp. 270-272; cf. pp. 135-137).

The problem as to why, among savages all on the same low level of material culture, one tribe derives descent through women, while its nearest neighbouring tribe, with ceremonies, rites, beliefs and myths, bears the totemic character in a similar climate, traces descent through men, seems totally insoluble. Again, we find that the civilized Lycians, as described by Herodotus (book i. ch. 173), reckoned lineage in the female line, while the naked savages of north and central Australia reckon in the male line. Our knowledge does not enable us to explain the change from female to male tracing of lineage. Yet the change was essential for the formation of the family system of civilized life. The change may be observed taking place in the region of North-West America peopled by the Thilnekt, Haida and Salish tribes, the first are pure totemists, the last have arrived, practically, in the south, at the modern family, while a curious intermediate stage pervades the inter-racial station.

The best authority on the Family developed in different shapes in North-West America is Charles Hill-Tout (cf. "Origin of the Totemism of the Aborigines of British Columbia," Transactions of the Royal Society of Canada, vol. vii. sect. 11, 1901). He, like many American and some English and continental students, applies the term "totem" not only to the hereditary totem of the exogamous kin, but to the animal familiars of individual men or women, called manitous, naganu, ayamare, and jumbe, among North American Indians, in South America, in Borneo and in the Euaiali tribe of New South Wales. These animal familiars are chosen by individuals, obeying the monition of dreams, or are assigned to them at birth, or at puberty, by the tribal magicians. It has often been suggested that totemism arose when the familiar of an individual became hereditary to the group, and there is no doubt that such a thing would occur under a system of reckoning descent and inheriting totems. Such women, but as a Tsimshian myth says that a man's sister adopted his animal familiar, the bear, and transmitted it to her offspring, Hill-Tout supposes that this may have been the origin of totemism in tribes with reckoning of descent in the female line. Instances, however, are not known to exist in practice, and myths are mere baseless savage hypotheses.

Exogamy, in his opinion, is the result of treaties of political alliance with exclusive intercommunium between two sets of kinsfolk by blood, totemism being a mere accidental concomitant. This theory evades the difficulties raised by the hypothesis of deliberate reformatory legislation introducing the bisection of the tribe into exogamous societies.

AUTHORITIES.—The study of the History of the Family has been subject to great fluctuation of opinion, as unexpected evidence has kept pouring in from many quarters. The theory of primordial promiscuity, which in 1870 succeeded to Sir Henry Maine's patriarchal theory, and in 1890 was succeeded by the anthropological marriage, and the tnanitus, or "patriarchal theory," but to the view that the jealousy of the Sire of the "Cyclopean family," or "Gorilla family" invested the husband with such a power, or laid the basis of primordial marriage. The whole subject has been essentially swayed by English-speaking writers, as the English and Americans are brought most into contact with the most archaic savage societies. Among the more useful and interesting additional works already cited, may be mentioned Professor J. Kohler, Zur Urgeschichte der Ehe (Stuttgart, 1897). Professor Kohler is in favour of a remote past of "collective marriage," indicated, as in Morgan's view, by the existing savage names of relationships, which are expressive of relations of consanguinity. E. S. Hartland (Primitive Paternity, 1910) discusses myths of supernatural birth in relation to the history of the family.

One well-cared for work by Herr Cunow (Die Verwandtschafts-Organisationen der Australier, Stuttgart, 1874) deals with the Matrimonial Classes of Australian tribes. Cunow supposes that descent was originally reckoned in the male line, and that tribes with this organization (such as the Nurrinjery) are the more primitive. In this opinion he has few allies: and on the origin of Exogamy he seems to possess no definite ideas. Pfeiler's Ursprung des Totemismus (Berlin, 1906) explains Totemism as arising from the need of names for early groups of men: names which could be expressed in pictographs and tattooing, to which we may add "gesture language." He does not think it likely that this was the origin of totemism, for Pfeiler seems to think that the pictograph (say of a Crow or an Eagle Hawk) was prior to the group name. But, he remarks, like Howitt, "the germ of Totemism is the naming"; and the connexion of the name of the animal with the name of the group or of the men and their name-giving animal.

Other useful sources of information are the annual Reports of the Bureau of Ethnology (Washington), the Journal of the Institute of the Anthropological Society, Folk Lore (the organ of the Folk Lore Society), and Durkheim's L'Anne sociologique. Tabou et totemisme (Mauritius, by M. van de Walle, 1904) is a valuable contribution to knowledge.

For India, where vestiges of totemism linger in the hill tribes, see Risley and Crooke, Tribes and Castes, vols. i., ii., iii., iv., and Crooke, Populär Religion; also Crooke in J.A.I. (N.S.), vol. i. pp. 232-244.

FAMINE (Lat. James, hunger), extreme and general scarcity of food, causing distress and deaths from starvation among the population of a district or country. Famines have caused widespread suffering in all countries and ages. A list of the chief famines recorded by history is given farther on. The causes of famine are partly natural and partly artificial. Among the natural causes may be classed all failures of crops due to excess or defect of rainfall and other meteorological phenomena, or to the ravages of insects and vermin. Among the artificial causes may be classed war and economic errors in the production, transport and sale of food-stuffs.

The natural causes of famine are still mainly outside our control, though science enables agriculturists to combat them more successfully, and the improvement in means of transport allows a rich harvest in one land to supplement the defective

166
crops in another. In tropical countries drought is the commonest cause of a failure in the harvest, and where great droughts are not uncommon—as in parts of India and Australia—the hydraulic engineer comes to the rescue by devising systems of water-storage and irrigation. It is less easy to provide against the evils of excessive rainfall and of frost, hail and the like. The experience of the French in Algiers shows that it is possible to stamp out a plague of locusts, such as is the greatest danger to the farmer in many parts of Argentina. But the ease with which food can nowadays be transported from one part of the world to another minimizes the danger of famine from natural causes, as we can hardly conceive that the whole food-producing area of the world should be thus affected at once.

The artificial causes of famine have mostly ceased to be operative on any large scale. Chief among them is war, which may cause a shortage of food-supplies, either by its direct ravages or by depriving the supply of agricultural labour. But only local famines are likely to arise from this cause. Legislative interference with agricultural operations or with the distribution of food-supplies, currency restrictions and failure of transport, which have all been responsible in the past, are unlikely thus to operate again; nor is it probable that the modern speculators who attempt to make "corners" in wheat could produce the evil effects contemplated in the old statutes against forestallers and regators.

Such local famines as may occur in the 20th century will probably be attributable to natural causes. It is impossible to regulate the rainfall of any district, or wholly to supply its failure by any system of water-storage. Irrigation is better able to bring fertility to a naturally arid district than to avert the failure of crops in one which is naturally fertile. The true palliative of famine is to be found in the improvement of methods of transport, which make it possible rapidly to convey food from one district to another. But the efficiency of this preventive stops short at the point of saving human life. It cannot prevent a rise in prices, with the consequent suffering among the poor. Still, every year makes it less likely that the world will see a renewal of the great famines of the past, and it is only the countries where civilization is still backward that are in much danger of even a local famine.

Great Famines.—Amongst the great famines of history may be named the following:

b.c. 436 Famine at Rome, when thousands of starving people threw themselves into the Tiber.

A.D. 12 Great famine in Egypt.

650 Famine throughout India.

874 Universal famine.

941, 1022 Great famines in India, in which entire provinces and 1033 were depopulated and man was driven to cannibalism.

1005 Famine in England.

1016 Famine throughout Europe.

1064-1072 Seven years' famine in Egypt.

1148-1159 Eleven years' famine in India.

1162 Universal famine.

1344-1345 Great famine in India, when the Mogul emperor was unable to obtain the necessaries for his household. The famine continued for years and thousands upon thousands of people perished of want.

1350-1407 The Durga Devi famine in India, lasting twelve years.

1586 Famine in England which gave rise to the Poor Law system.

1661 Famine in India, when not a drop of rain fell for two years.

1769-1770 Great famine in Bengal, when a third of the population (10,000,000 persons) perished.

1783 The great famine in India, which extended from the eastern edge of the Benares province to Lahore and Jammu.

1790-1792 The Doji Bora, or skull famine, in India, so-called because the people died in such numbers that they could not be buried. According to tradition this was one of the severest famines ever known. It spread over the whole of Bombay into Hyderabad and affected the northern districts of Madras. Relief works were first opened during this famine in Madras.

Famine 1838

Intense famine in North-West Provinces (United Provinces) of India: 800,000 perished.

1846-1847 Famine in Ireland, due to the failure of the potato-crop. The Irish were made by parliament amounting to £10,000,000.

1861 Famine in North-West India.

1866 Famine in Bengal and famine of one million perished.

1869 Intense famine in Rajputana; one million and a half perished. The government initiated the policy of saving life.

1874 Famine in Behar, India. Government relief in excess of the needs of the people.

1876-1878 Famine in Bombay, Madras and Mysore; five millions perish. Relief insufficient.

1877-1878 Severe famine in north China. Nine and a half millions said to have perished.

1887-1889 Famine in China.

1891-1892 Famine in Russia.

1899-1901 Famine in India. One million people perished. Estimated loss to India £50,000,000. The government spent £10,000,000 on relief, and at one time there were 4,500,000 people on the relief works.

1905 Famine in Russia.

Famines in India.—Owing to its tropical situation and its almost entire dependence upon the monsoon rains, India is more liable than any other country in the world to crop failures, which upon occasion deepen into famine. Every year sufficient rain falls in India to secure an abundant harvest if it were evenly distributed over the whole country; but as a matter of fact the distribution is so uneven and so uncertain that every year some district suffers from insufficient rainfall. In fact, famine is, to all intents and purposes, endemic in India, and is a problem to reckon with every year in some portion of that vast area. The people depend so entirely upon agriculture, and the harvest is so entirely destroyed by a single monsoon failure, that wherever a total failure occurs the landless labourer is immediately thrown out of work and remains out of work for the whole year. The question is thus one of lack of employment, rather than lack of food. The food is there, perhaps at a slightly enhanced price, but the unemployed labourer has no money to buy it. The problem is very much the same as that met by the British Poor Law system. Every year in England a poor rate of some £23,000,000 is expended for a population of 40 millions; while it is only in an exceptional year in India that £10,000,000 is spent on a population of 350 millions.

Famine seem to take great India periodical intervals, which have been held to be in some way dependent on the sun-spot period. Every five or ten years the annual scarcity widens its area and becomes a recognized famine; every fifty or a hundred years whole provinces are involved, loss of life becomes widespread, and a great famine is recorded. In the 140 years since Warren Hastings initiated British rule in India, there have been nineteen famines and five severe scarcities. For the period preceding British rule the records have not been so well preserved, but there is ample evidence to show that famine was just as frequent in its incidence and infinitely more deadly in its effects under the native rulers of India. In the great Bengal famine of 1769-1770, which occurred shortly after the foundation of British rule, but while the native officials were still in power, a third of the population, or ten millions out of thirty millions, perished. From this it may be guessed what occurred in the centuries under Mogul rule, when for years there was no rain, when famine lasted for three, four or twelve years, and entire cities were left without an inhabitant. In the famine of 1901, the worst of recent years, the loss of life in British districts was 3% of the population affected, as against 33% in the Bengal famine of 1770.

The native rulers of India seem to have made no effort to relieve the sufferings of their subjects in times of famine; and even down to 1866 the British government had no settled famine policy. In that year the Orossane famine awakened the public conscience, and the commission presided over by Sir George Campbell laid down the lines upon which subsequent famine-relief was organized. In the Rajputana famine of 1860 the humane principle of saving every possible life was first
enunciated. In the Behar famine of 1874 this principle was even
carried to an extreme, the cost was enormous, and the people
were in danger of being pauperized. The resulting reaction
caused a regrettable loss of life in the Madras and Bombay
famine of 1876-1878, and the Famine Commission of 1880,
followed by those of 1887 and 1901, laid down the principle that
every possible relief must be supplied, but that the wages on relief
works must be so regulated in relation to the market rate of
wages as not to undermine the independence of the people.
The experience gained in the great famines of 1898 and 1901 has been
garnered by these commissions, and stored up in the "famine
codes" of each separate province, where rules are provided for
the treatment of famine directly a crop failure is seen to be
probable. The first step is to open test works; and directly
they show the necessity, regular relief works are established,
in which the people may earn enough to keep them from starva-
tion, until the time comes to sow the next crop.

As a result of the severe famine of 1878-1879, Lord Lytton's
government instituted a form of insurance against famine known
as the Famine Insurance Grant. A sum of Rs. 1,500,000 was
to be yearly set aside for purposes of famine relief. This scheme
has been widely misunderstood; it has been assumed that an
entirely separate fund was created, and that in years when the
specified sum was not paid into this fund, the purpose of the
government was not carried out. But Sir John Strachey,
the author of the scheme, explains in his book on India that
the original intention was nothing more than the annual applica-
tion of the annual revenue of the indicated amount, to purposes
of famine relief; and that when the country was free from
famine, this sum should be regularly devoted to the discharge
of debt, or to the prevention of debt which would otherwise
have been incurred for the construction of railways and canals.
The sum of 1½ crores is regularly set aside for this purpose,
and is devoted as a rule to the construction of protective irriga-
tion works, and for investigating and preparing new projects
falling under the head of protective works.

The measures by which the government of India chiefly
endeavored to remove the liability of the country to famine are
the promotion of railways; the extension of canal and well
irrigation; the reclamation of waste lands, with the establish-
ment of fuel and fodder reserves; the introduction of agricultural
improvements; the multiplication of industries; emigration;
and finally the improvement where necessary of the revenue and
rent systems. In times of famine the function of the railways
in distributing the grain is just as important as the function of
the irrigation-canais in increasing the amount grown. There is
always enough grain within the boundaries of India for the needs
of the people; the only difficulty is to transport it to the tract
where it is required, a particular work being the extension of the
extension of railways, in the famines of 1898 and 1901 there was
never any dearth of food in any famine-stricken tract; and the
only difficulty was to find enough rolling-stock to cope with the
demand. Irrigation protects large tracts against famine, and has
increased immensely the wheat output of the Punjab; the
Irrigation Commission of 1903 recommended the addition of 64
million acres to the irrigated area of India, and that recommenda-
tion is being carried out at an annual cost of 1½ millions sterling
for twenty years, but at the end of that time the list of works
that will return a lucrative interest on capital will be practically
exhausted. Local conditions do not make irrigation everywhere
possible.

As five-sixths of the whole population of India are dependent
upon the land, any failure of agriculture becomes a national
calamity. If there were more industries and manufactures in
India, the dependence on the land would not be so great and
the liability to lack of occupation would not be so uniform in any
particular district. The remedy for this is the extension of
factories and home industries; but European capital is difficult
to obtain in India, and the native capital prefers to its the
ruinous factories and industries, therefore, is a waste of time.
It is sometimes alleged by native Indian politicians that famines
are growing worse under British rule, because India is becoming
exhausted by an excessive land revenue, a civil service too
expensive for her needs, military expenditure on imperial objects,
and the annual drain of some £15,000,000 for "home charges."
The reply to this indictment is that the British land revenue is
£16,000,000 annually, whereas Aurangzeb's over a smaller area,
allowing for the difference in the value of the rupee, was
£110,000,000; though the Indian Civil Service is expensive,
it's cost is more than covered by the fact that India, under
British guarantee, obtains her loans at 3½% as against 10%
or more paid by native rulers; though India has a heavy military
burden, she pays no contribution to the British navy, which
protects her seaboard from invasion; the drain of the home
farms cannot be very great, as India annually absorbs 6 millions
sterling of the precious metals; in 1899-1900, a year of famine,
the net imports of gold and silver were 172,000,000. Finally,
it is estimated by the census commissioners that in the famine of
1901 three million people died in the native states and only one
million in British territory.

FAN (Lat. vanus; Fr. éventail), in its usually restricted
meaning, a light implement used for giving motion to the air
in order to produce coolness to the face; the word is, however,
also applied to the winnowing fan, for separating chaff from
grain, and to various mechanical appliances for ventilation, &c.
Ventilabrum et flabellum are names under which ecclesiastical
fans are mentioned in old inventories. Fans for cooling the face
have been in use in hot climates from remote ages. A bas-relief
in the British Museum represents Sennacherib with female
figures carrying feather fans. They were attributes of royalty
along with horse-hair fly-fappers and umbrellas. Examples
may be seen in plates of the Egyptian sculptures at Thebes
and other places, and also in the ruins of Persepolis. In
the museum of Bouak, near Cairo, a wooden fan handle showing
holes for feathers is still preserved. It is from the tomb of Amen-
a-re, a man of the 19th dynasty, that these instruments were
found. In India fans were also attributes of men in authority,
and sometimes sacred emblems. A heart-shaped fan, with an ivory handle, of unknown age, and held in great veneration by the Hindus, was given to
King Edward VII. when prince of Wales. Large punkahs or
screens, moved by a servant who does nothing else, are in
common use in hot countries, and particularly India.

Fans were used in the early middle ages to keep flies from
the sacred elements during the celebrations of the Christian mysteries.
Sometimes they were round, with bells attached—of silver or
silver gilt. Notice how the fans in the scenes of the coronations of
St. Pult's, London, Salisbury cathedral and many other churches
exist still. For these purposes they are no longer used in
the Western church, though they are retained in some Oriental rites.
The large feather fans, however, are still carried in the state
processions of the supreme pontiff in Rome, though not used
during the celebration of the mass. The fan of Queen Theodo-
linda (7th century) is still preserved in the treasury of the
cathedral of Monza. Fans made part of the bridal outfit, or
mundo musibbris, of Roman ladies.

Folding fans had their origin in Japan, and were imported
into Europe in the 13th century. The name the shape still used—a
section of a circle of paper pasted on a light radiating framework
of bamboo, and variously decorated, some in colours, others
of white paper on which verses or sentences are written. It is a

compliment in China to invite a friend or distinguished guest to write some sentiment on your fan as a memento of any special occasion, and this practice has continued. A fan that has some celebrity in France was presented by the Chinese ambassador to the comtesse de Clauzel at the coronation of Napoleon I. in 1804. When a site was given in 1635, on an artificial island, for the settlement of Portuguese merchants in Nippo in Japan, the space was laid out in the form of a fan as emblematic of an object acceptable for general use. Men and women of every rank both in China and Japan carry fans, even artisans using them with one hand while working with the other. In China they are often made of carved ivory, the sticks being plates very thin and sometimes carved on both sides, the intervals between the carved parts pierced with astonishing delicacy, and the plates held together by a ribbon. The Japanese make the two outer guards of the stick, which cover the others, occasionally of beaten iron, extremely thin and light, damascened with gold and other metals.

Fans were used by Portuguese ladies in the 14th century, and were well known in England before the close of the reign of Richard II. In France the inventory of Charles V. at the end of the 14th century mentions a folding ivory fan. They were brought into general use in that country by Catherine de' Medici, probably from Italy, then in advance of other countries in all matters of personal luxury. The court ladies of Henry VIII’s reign in England were used to handling fans. A lady in the “Dance of Death” by Holbein holds a fan. Queen Elizabeth is painted with a round feather fan in her portrait at Gorhambury; and as many as twenty-seven are enumerated in her inventory (1606). Coryat, the English traveller, in 1606 describes them as common in Italy. They also became of general use from that time in Spain. In Italy, France and Spain fans had special conventional uses, and various actions in handling them grew into a code of signals, by which ladies were supposed to convey hints or signals to admirers or to rivals in society. A paper in the Spectator humorously proposes to establish a regular drill for these purposes.

The chief seat of the European manufacture of fans during the 17th century was Paris, where the sticks or frames, whether of wood or ivory, were made, and the decorations painted on mounts of very carefully prepared vellum (incorrectly called chicken skin)—a material stronger and tougher than paper, with a surface as smooth and as flexible as silk. French fans were exported to Madrid and other Spanish cities, where they were decorated by native artists. Many were exported complete; of old fans called Spanish a great number were in fact made in France. Louis XIV. issued edicts at various times to regulate the manufacture. Besides fans mounted with parchment, Dutch fans of ivory were imported into Paris, and decorated by the heraldic painters in the process called “Vernis Martin,” after a famous carriage painter and inventor of colours lac vernish. Fans of this kind belonging to Queen Victoria and the baronesse de Rothschild were exhibited in 1870 at Kensington. A fan of the date of 1660, representing sacred subjects, is attributed to Philippe de Champagne, another to Peter Oliver in England in the 17th century. Cano de Arevalo, a Spanish painter of the 17th century, devoted himself to fan painting. Some harsk expressions of Queen Christina to the young ladies of the French court are said to have caused an increased ostentation in the splendour of their fans, which were set with jewels and mounted in gold. Rosalba Carriera was the name of a fan painter of celebrity in the 17th century. Le Brun and Romanoff were much employed during the same period. Klingstedt, a Dutch artist, enjoyed a considerable reputation in the latter part of the century. The fan-makers of that time were a very numerous and wealthy body. Many of them file their teeth to points. Their hair, which is woolly, is worn by the women long, reaching below the nape of the neck. The men wear it in a variety of shapes, often building it up over a wooden base. The growth of the hair appears abundant, but that on the face is usually removed. Little clothing is worn; the men wear a bark waist-cloth, the women a plantain girdle, sometimes with a bustle of dried grass. A chief wears a leopard's skin round the shoulders. Both sexes tattoo and paint the body, formerly imported from Italy, which had been painted on swanskin parchment prepared with various perfumes.

During the 18th century all the luxurious ornamentation of the day was bestowed on fans as far as they could display it. The sticks were made of mother-of-pearl or ivory, carved with extraordinary skill in France, Italy, England and other countries. They were painted from designs of Boucher, Watteau, Lancret and other “genre” painters; Hébert, Rau, Chevalier, Jean Boquet, Mme. Vertié, are known as fan-painters. These fashions were followed in most countries of Europe, with certain national differences. Taffeta and silk, as well as fine parchment, were used for the mounts. Little circles of glass were let into the stick to be looked through, and small telescopic glasses were sometimes contrived at the pivot of the stick. They were occasionally mounted with the finest point lace. An interesting fan (belonging to Madame de Thiac in France), the work of Le Flamand, was presented by the municipality of Dieppe to Marie Antoinette on the birth of her son the dauphin. From the time of the Revolution the old luxury expended on fans died out. Fine examples ceased to be exported to England and other countries. The painting on them represented scenes or personages connected with political events. At a later period fan mounts were often prints coloured by hand. The events of the day mark the date of many examples found in modern collections. Among the fan-makers of modern days the names of Alexandre, Duvelleroy, Fayet, Vanier became well known in Paris; and the designs of Charles Conder (1868-1909) have brought his name to the front in this art. Painters of distinction often design and paint the mounts, the best designs being figure subjects. A great impulse was given to the manufacture and painting of fans in England after the exhibition which took place at South Kensington in 1874. Modern collections of fans take their date from the emigration of many noble families from France at the time of the Revolution. Such objects were given as souvenirs, and occasionally sold by families in straitened circumstances. A large number of fans of all sorts, principally those of the 18th century, French, English, German, Italian, Spanish, &c., have been bequeathed to the South Kensington (Victoria and Albert) Museum.

The sticks of folding fans are called in French brins, the two outer guards panaches, and the mount feuilles.

**FANCY** (a shortened form, dating from the 15th century, of “fantasy,” which is derived through the O. Fr. fantasye, modern fantaisie, from the Latinized form of the Gr. φαντασία, phantasia, to show), display, showing forth, as a philosophical term, the presentative power of the mind. The word “fancy” and the older form “fantasy,” which is now chiefly used poetically, was in its early application synonymous with imagination, the mental faculty of creating representations or images of things not present to the senses; it is more usually, in this sense, applied to the lighter forms of the imagination. “Fancy” also commonly means inclination, whim, caprice. The more learned form “phantasy,” as also such words as “phantom” and “phantasm,” is chiefly confined to visionary imaginings.

**FANG** (Fan, Fang, Panwe, Pawe, Pahouin, Pauwen, Mpangwe), a powerful African people occupying the Gabun district north of the Ogowe river in French Congo. Their name means “men.” They call themselves Pa-wa, Fa-wa and Fa with highly nasaled n. They are a finely-made race of chocolate colour; some are very dark, but these are of slave origin. They have bright expressive oval faces with prominent black bones. Many of them file their teeth to points. Their hair, which is woolly, is worn by the women long, reaching below the nape of the neck. The men wear it in a variety of shapes, often building it up over a wooden base. The growth of the hair appears abundant, but that on the face is usually removed. Little clothing is worn; the men wear a bark waist-cloth, the women a plantain girdle, sometimes with a bustle of dried grass. A chief wears a leopard's skin round the shoulders. Both sexes tattoo and paint the body,
and delight in ornaments of every kind. The men, whose sole occupations are fighting and hunting, all carry arms—muskets, spears for throwing and stabbing, and curious throwing-knives with blades broader than they are long. Instead of bows and arrows they use blowpipes made of echu, with which they hunt apes and birds. In battle the Fang used to carry elephant hide shields; these have apparently been discarded.

When first met by T. E. Bowdich (1815) the Paamways, as he calls the Fang, were an inland people inhabiting the hilly plateaux north of the Ogoué affluents. Now they have become the neighbours of the Mpongwe (q.v.) of Glass and Libreville on the Kombo river, while south of the Gabun they have reached the sea at several points. Their original home is probably to be placed somewhere near the Congo. Their language, according to Sir R. Burton; is soft and sweet, and a contrast to their harsh voices, and the vocabularies collected prove it to be of the Bantu-Negroid linguistic family. W. Winwood Reade (Sketch Book, i. p. 158) states that "it is like Mpongwe (a pure Bantu idiom) cut in half; for instance, njina (gorilla) in Mpongwe is njin in Fan." The plural of the tribal name is formed in the usual Bantu way, Ba-Fang.

Morally the Fang are superior to the negro. Mary Kingsley writes: "The Fan is full of fire, temper, intelligence and go, very teachable, rather difficult to manage, quick to take offence, and utterly indifferent to human life." This latter characteristic has made the Fang as dangerous by night as they are noted cannibals, and ferocious in nature. Prisoners are badly treated and are often allowed to starve. The Fang are always fighting, but the battles are not bloody. After the fall of two or three warriors the bodies are dragged off to be devoured, and their friends disperse. Burton says that their cannibalism is limited to the consumption of slain enemies; that the sick are not devoured; and that the dead are decently buried, except slaves, whose bodies are thrown into the forest. Mary Kingsley, on the other hand, believed their cannibalism was not limited. Since the discovery of the coast in 1444 many remarkable and interesting things have happened to the Fang, and it is not a people like the negro. He will eat his next door neighbour's relations and sell his own deceased to his next door neighbour in return, but he does not buy slaves and fatten them up for his table as some of the middle Congo tribes do. He has no slaves, no prisoners of war, no cemeteries, so you must draw your own conclusions." Among certain tribes the aged alone are permitted to eat human flesh, which is taboo for all others. There is no doubt that the cannibalism of the Fang is diminishing before the advance of civilization. Apart from their ferocity, the Fang are an agreeable and industrious people. They are skillful workers in iron and have various inventions called bikii. They live in a simple way, and are not a people like the negro. They live in a simple way, and are not a people like the negro. They are energetic traders and are skilled in pottery and in gardening. Their religion appears to be a combination of primitive animism and ancestor worship, with a belief in sympathetic magic.

FANO (anc. Fanum Fortunae, q.v.), a town and episcopal see of the Marches, Italy, in the province of Pesaro and Urbino, 8 m. S.E. of the former by rail, and 46 ft. above sea-level, on the N.E. coast of Italy. Pop. (1901), town 10,535, commune 24,730. The cathedral has a 13th century portal, but the interior is unimportant. The vestibule of S. Francesco contains the tombs of some members of the Malatesta family. S. Croce and S. Maria Novella contain works by Giovanni Pisano, the predella of one of which is attributed to Raphael. S. Agostino contains a painting of S. Angelo Custode ("the Guardian Angel"), which is the subject of a poem by Robert Browning. The fine Gothic Palazzo della Ragoine (1399) has been converted into a theatre. The palace of the Malatesta, with fine porticoes and Gothic windows, was much damaged by an earthquake in 1874. S. Michele, built against the arch of Augustus, is an early Renaissance building (1475-1490), probably by Matteo Nuzio of Fano, with an ornate portal. The façade has an interesting relief showing the colonnade added by Constantine as an upper storey to the arch of Augustus and removed in 1463. Fano in the middle ages passed through various political vicissitudes, and in the 14th century became subject to the Malatesta. In 1458 Pius II. added it to the states of the Church. Julius II. established here in 1514 the first printing press with movable Arabic type. The harbour was restored by Paul V. but is now unimportant.

FANSHAWE, SIR RICHARD, Bart. (1668-1666), English poet and ambassador, son of Henry Fanshawe, remembrancer of the exchanger, of W. Fanshawe, his brother, and daughter of Thomas Smith or Smythe, was born early in June 1668, and was educated in Cripplegate by the famous schoolmaster, Thomas Farriby. In November 1623 he was admitted fellow-commoner of Jesus College, Cambridge, and in January 1626 he entered the Inner Temple; but the study of the law being distasteful to him, he travelled in France and Spain. On his return, an accomplished linguist, in 1635, he was appointed secretary to the English embassy at Madrid under Lord Astor. At the outbreak of the Civil War he joined the king, and while at Oxford was appointed secretary of Sir John Harrison and Balls, Hertfordshire. About the same time he was appointed secretary at war to the prince of Wales, with whom he set out in 1645 for the western counties, Scilly, and afterwards Jersey. He compounded in 1646 with the parliamentary authorities, and was allowed to live in London till October 1647, visiting Charles I. at Hampton Court. In 1647 he published his translation of the Pastor Fido of Guarini, which he reissued in 1648 with the addition of several other poems, original and translated. In 1648 he was appointed treasurer to the navy under Prince Rupert. In November of this year he was in Ireland, where he actively engaged in the royalist cause till the spring of 1650, when he was despatched by Charles II. on a mission to obtain help from Spain. This was refused, and he joined Charles in Scotland as secretary. On the 2nd of September 1650 he had been created a baronet. He accompanied Charles in the expedition into England, and was taken prisoner at the battle of Worcester on the 3rd of September 1651. After a confinement of some weeks at Whitehall, he was allowed, with restrictions, and under the supervision of the authorities, to choose his own place of residence. He published in 1653 his Selected Parts of the Lives of the Illustrious Kings of France, revised and abridged. In 1654 he completed translations of two of the comedies of the Spanish poet Antonio de Mendoza, which were published after his death, Querer per solo querer: To Love only for Love's Sake, in 1670, and Fiestas de Avarijes in 1671. But the great labour of his retirement was the translation of the Lusiad, by Camoens, published in 1655. It is in ottava rima, with the translation prefixed to it of the Latin poem Fupor Petroniensiis. In 1658 he published a Latin version of the Faithful Shepherdess of Fletcher;

FASHAW, Charles, Englishman, who went to France, received a commission as one of the French ambassa

FATTO—FANTASTICI
FANTAN—FANTI

returned to Madrid, having failed in his mission, and was almost immediately recalled by Clarendon on the plea that he had exceeded his instructions. He died very shortly afterwards before leaving Madrid, on the 26th of June 1666. He had a family of fourteen children, of whom five only survived him, Richard, the youngest, succeeding as second baronet and dying unmarried in 1711.

As a translator, whether from the Italian, Latin, Portuguese or Spanish, Fanshawe has a considerable reputation. His Pastor Fido and his Lustiad have not been superseded by later scholars, and his rendering of the latter is praised by Southey and Sir Richard Burton. As an original poet also the few verses he has left are sufficient evidence of exceptional literary talent.

AUTHORITIES.—Memoirs of Lady Fanshawe, written in 1676 and published 1682 (from an inaccurate transcript); this was reprinted from the original manuscript and edited by H. C. Fanshawe (London, 1807); article in the Dict. of Nat. Biography and authorities there quoted; Bibliographia Brit. (Kippis); Original Letters of Sir R. F. (2 vols., 1724), the earlier edition of 1702 with portrait being only vol. i. of this edition; Notes Genealogical and Historical of the Fanshawe Family (1866-1872); funeral sermon by H. Misc. 1164 (lets). (P. C. Y.)

FANTAN, a form of gambling highly popular among the Chinese. The game is simple. A square is marked in the centre of an ordinary table, or a square piece of metal is laid on it, the sides being marked 1, 2, 3 and 4. The banker puts on the table a double handful of small coins—in China "cash"—or similar articles, which he covers with a metal bowl. The players bet on the numbers, setting their stakes on the side of the square which bears the number selected. When all have staked, the bowl is removed, and the banker or croupier with a small stick removes coins from the heap, four at a time, till the final batch is reached. If it contains four coins, the backer of No. 4 wins; if three, the backer of No. 3 wins, and so on. Twenty-five per cent. is deducted from the stake by the banker, and the winner receives five times the amount of his stake thus reduced. In Macao, the Monte Carlo of China, play goes on day and night, every day of the week, and bets can be made from 5 cents to 500 dollars, which are the limits.

Fantan is also the name of a card game, played with an ordinary pack, by any number of players up to eight. The deal decided, the cards are dealt singly, any that are left over forming a stock, and being placed face downwards on the table. Each player contributes a fixed stake or "ante." The first player can enter if he has an ace; if he has not he pays an "ante," and if he fails at this the second player is then called upon and acts similarly till an ace is played. This (and the other aces when played) is put face upwards on the table, and the piles are built up from the ace to the king. The pool goes to the player who first gets rid of all his cards. If a player fails to play, having a playable card, he is fined the amount of the ante for every card in the other players' hands.

FANTASIA (Italian for "fantasy," a causing to be seen, from Greek, σαλσαρ, to show), a name in music sometimes loosely used for a composition which has little structural form, and appears to be as free a combination of unrelated material as the medley of familiar airs connected together with original passages of more or less brilliancy. The word, however, was originally applied to more formal compositions, based on the madrigal, for several instruments. Fantasias appear as distinct compositions in Bach's works, and also joined to a fugue, as in the "Great Fantasia and Fugue" in A minor, and the "Fantasia cromatica" in D minor. Brahms used the name for his shorter piano pieces. It is also applied to orchestral compositions "not long enough to be called symphonic poems and not formal enough to be called overtures" (Sir C. Hubert Parry, in G. W. Bannister, A Modern Day of Music). Schumann was much used in Tunis, Algeria and Morocco, with the meaning of "showing off," for an acrobatic exhibition of horsemanship by the Arabs. The riders fire their guns, throw them and their lances into the air, and catch them again, standing or kneeling in the saddle, all at full gallop.

FANTI, MANFREDO (1806-1865), Italian general, was born at Carpi and educated at the military college of Modena. In 1831 he was implicated in the revolutionary movement operated by Ciro Menotti (see Francis IV., of Modena), and was condemned to death and hanged in effigy, but escaped to France, where he was given an appointment in the French corps of engineers. In 1833 he took part in Mazzini's abortive attempt to invade Savoy, and in 1835 he went to Spain to serve in Queen Christina's army against the Carlists. There he remained for thirteen years, distinguishing himself in battle and rising to a high staff appointment. But on the outbreak of the war between Piedmont and Austria in 1848 he hurried back to Italy, and although at first his services were rejected both by the Piedmontese government and the Lombard provisional government, he was afterwards given the command of a Lombard brigade.

In the general confusion following on Charles Albert's defeat on the Mincio and his retreat to Milan, where the people rose against the unhappy king, Fanti's courage and tact saved the situation. He was elected member of the Piedmontese chamber in 1849, and on the renewal of the campaign he again commanded a Lombard brigade under General Ramorino. After the Piedmontese defeat at Novara (23rd of March) peace was made, but a rising broke out at Genoa, and Fanti with great difficulty got his Lombards from taking part in it. But he was suspected as a Mazzinian and a soldier of fortune by the higher Piedmontese officers, and they insisted on his being court-martialled for his operations under Ramorino (who had been tried and shot). Although honourably acquitted, he was not employed again until the Crimean expedition of 1855. In the second Austrian war in 1859 Fanti commanded the 2nd division, and contributed to the victories of Palestro, Magenta and San Martino. After the peace of Villafranca he was sent to organize the army of the Central Italian League (composed of the provisional governments of Tuscany, Modena, Parma and Romagna), was commissioned in it as a general, and as such he had the command of 45,000 men, whose function was to be ready to intervene in the papal states on the outbreak of a revolution. He showed statesmanlike qualities in steering a clear course between the exaggerated prudence of Baron Ricasoli, who wished to recall the troops from the frontier, and the impetuosity of Garibaldi, his second-in-command, who was anxious to invade Romagna prematurely, even at the risk of Austrian intervention. Fanti's firmness led to Garibaldi's resignation. In January 1860 Fanti became minister of war and marine under Cavour, and incorporated the League's army in that of Piedmont. In the meanwhile Garibaldi had invaded Sicily with his Thousand, and King Victor Emmanuel decided at last that he too must intervene; Fanti was given the chief command of a strong Italian force which invaded the papal states, seized Ancona and other fortresses, and defeated the papal army at Castelfidardo, where the enemy's commander, General Lamoricière, was captured. In three weeks Fanti had conquered the Marche and Umbria and taken 28,000 prisoners. When the army entered Neapolitan territory the king took the chief command, with Fanti as chief of the staff. After defeating a large Neapolitan force at Mola and organizing the siege operations round Gaeta, Fanti returned to the war office at Turin to carry out important army reforms. His attitude in opposing the admission of Garibaldi's 7000 officers into the regular army with their own grades made him the object of great unpopularity for a time, and led to a severe reprimand from Cavour. On the death of the latter (7th of June 1861) he resigned office and took command of the VII. army corps. But his health had now broken down, and after four years' suffering he died in Florence on the 5th of April 1865. His loss was greatly felt in the war of 1866.

See Carandini, Vita di Fanti (Verona, 1872); A. Di Giorgio, Il Generale M. Fanti (Florence, 1865). (L.V.)

FANTI, a nation of Negroes, inhabiting part of the seaboard of the Gold Coast colony, British West Africa, and about 20,000
sq. m. of the interior. They number about a million. They have many traditions of early migrations. It seems probable that the Fanti and Ashanti were originally one race, driven from the north-east towards the sea by more powerful races, possibly the ancestors of Fula and Hausa. There are many words in Fanti for plants and animals not now existing in the country, but which abound in the Gurunsi and Moshi countries farther north. These regions have been always haunted by slave-raiders, and possibly these latter may have influenced the exodus. At any rate, the Fanti were early driven into the forests from the open plains and slopes of the hills. The name Fanti, an English version of *Mfant,, is supposed to be derived from *fan, a wild cabbage, and *i, di or da, to eat; the story being that upon the exile of the tribe into the forest, the wild cabbage was their only food. They are divided into seven tribes, obviously totemic, and with rules as to exogamy still in force. (1) Kwanu, buffalo; (2) Echwe, leopard; (3) Eso, bush-cat; (4) Nitchewa, dog; (5) Nnona, parrot; (6) Ebrazdi, lion; and (7) Abru, corn-stalk; these names are obsolete, though the meanings are known. The tribal marks are three gashes in front of the ear on each side in a line parallel to the jaw-bone. The Fanti language has been associated by A. B. Ellis with the Ashanti speech as the principal descendant of an original language, possibly the Tshi (pronounced Twi), which is generally considered as the parent of Ashanti, Fanti, Akim, and modern Tshi. 

The average Fanti is of a dull brown colour, of medium height, with negroid features. Some of the women, when young, are quite pretty. The women use various perfumes, one of the most usual being prepared from the excrement of snakes. There are no special initiatory rites for the youthful Fanti, only a short seclusion for girls when they reach the marriageable age. Marriage is a mere matter of sale, and the maidens are tricked out in all the family finery and walk round the village to indicate that they are ready for husbands. The marriages frequently end in divorce. The family is universal, and of the children is left exclusively to the mothers, who are regarded by the Fanti with deep veneration, while little attention is paid to the fathers. Wives never eat with their husbands, but always with the children. The rightful heir in native law is the eldest nephew, i.e. the eldest sister's eldest son, who invariably inherits wives, children and all property. As to tenure of land, the source of ownership of land is derived from the possession of the chief's "stool," which is, like the throne of a king, the symbol of authority, and not even the chief can alienate the land from the stool. Females may succeed to property, but generally speaking the acquisition of such property is the result of their succeeding to the stool of a chief. The Fanti are not permanent cultivators of the soil. Three or at most five years will cover the period during which land is continuously cultivated. The commonest native dishes are palm-oil chop, a bowl of palm oil, produced by boiling freshly ground palm nuts, in which a fowl or fish is then cooked; and fufu, "white," a boiled mass of yams or plantains. The Fanti have a taste for shark-flesh, called locally "stink-fish." It is sliced up and partly sun-dried, and is eaten in a putrid state. The Fanti are skilful sailors and fishermen, build excellent canoes, and are expert weavers. Pottery and goldsmithry are trades also followed. Their religion is fetishism, every Fanti having his own "fetish" or familiar spirit, but there is a belief in a beneficent Creative Being. Food is offered the dead, and a ceremony of purification is said to be indulged in at funerals, the bearers and mourners plunging into the sea or river after the interment.

**FANTIN-LATOUR—FĀRĀBĪ**

(1836–1904). French artist, was born at Grenoble on the 14th of January 1836. He studied first with his father, a pastel painter, and then at the drawing school of Lecocq de Boisbaudran, and later under Couture. He was the friend of Ingres, Dalacroy, Corot, Courbet and others. He exhibited in the Salon of 1861, and many of his more important canvases appeared on its walls in later years, though 1863 found him with Harpignies, Manet, Legros, and Whistler in the Salon des Refusés. Whistler introduced him to English artistic circles, and he lived for some time in England, many of his portraits and flower pieces being in English galleries. He died on the 28th of August 1904. His portrait groups, arranged somewhat after the manner of the Dutch masters, are as interesting from their subjects as they are from the artistic point of view. "Hommage à Delacroix" showed portraits of Whistler and Legros, Baudelaire, Champfleury and himself; "Un Atelier à Batignolles" gave portraits of Monet, Manet, Zola and Renoir, and is now in the Luxembourg; "Un Coin de table" presented Verlaine, Rimbaud, Camille Peladan and others; and "Autour du Piano" contained portraits of Chabrier, D'Indy and other musicians. His paintings of flowers are perfect examples of the art, and form perhaps the most famous section of his work in England. In his later years he devoted much attention to lithography, which had occupied him as early as 1862, but his examples were then considered so revolutionary, with their strong lights and black shadows, that the printer refused to execute them. After "L'Anniversaire" in honour of Berlioz in the Salon of 1876, he regularly exhibited lithographs, some of which were excellent examples of delicate portraiture, others being elusive and imaginative drawings of animals. The music of Wagner (who was living at that time in Paris as early as 1864), Berlioz, Brahms and other composers. He illustrated Adolphe Jullien's Wagner (1886) and Berlioz (1888). There are excellent collections of his lithographic work at Dresden, in the British Museum, and a practically complete set given by his widow to the Louvre. Some were also exhibited at South Kensington in 1898–1899, and at the Dutch gallery in 1904.

**FANUM PORTUNAR** (mod. *Pano*), an ancient town of Umbria, Italy, at the point where the Via Flaminia reaches the N.E. coast of Italy. Its name shows that it was of Roman origin, but of its foundation we know nothing. It is first mentioned, with Pisauro and Ancona, as held by Julius Caesar in 49 B.C. Augustus planted a colony there, and round it constructed a wall (of which some remains exist), as is recorded in the inscription on the triple arch erected in his honour at the entrance to the town (A.D. 9–10), which is still standing. Vitruvius tells us that there was a temple in his honour and a temple of Jupiter, and describes a basilica of which he himself was the architect. The arch of Augustus bears a subsequent inscription in honour of Constantine, added after his death by L. Turcius Secundus, *corrector Flaminiae et Picieni*, who also constructed a colonnade above the arch. Several Roman statues and heads, attributable to members of the Julio-Claudian dynasty, were found in the convent of S. Filippo in 1899. These and other objects are now in the municipal museum (E. Brizio in *Notizie degli scavi*, 1899, 149 seq.). Of the temple of Fortuna from which the town took its name no traces have been discovered.

(T. As.)

**FAN VAULT**, in architecture, a method of vaulting used in the Perpendicular style, of which the earliest example is found in the cloisters of Gloucester cathedral, built towards the close of the 14th century. The ribs are all of one curve and equidistant, and their divergency, resembling that of an open fan, has suggested the name. One of the finest examples, though of later date (1460), is the vault over the staircase of Christ Church, Oxford. For the origin of its development see VAULT.

**FARĀBĪ, ṢĪṢĪNA [Abū Nasr Farābī] (870–950), Arabic philosopher, was born of Turkish stock at Fārāb in Turkestan, where also he spent his youth. Thence he journeyed to Baghdad, where he learned Arabic and gave himself to the study of mathematics, medicine and philosophy, especially the works of Aristotle. Later he went to the court of the Ḥamdānī Saif addaula, from whom he received a warm welcome and a small pension. Here he lived a quiet if not ascetic life.**
He died in Damascus, whither he had gone with his patron. His works are very clear in style, though epistrophic rather than systematic in the treatment of subjects. Unfortunately the success of Avicenna seems to have led to the neglect of much of his work. In Europe his compendium of Aristotle's *Rhetoric* was published at Venice, 1484. Two of his smaller works appear in *Alfarabii operaomnia* (Paris, 1638), and two are translated in F. A. Schmidler's *Documenta philosophiae Arabum* (Bonn, 1836). More recently Fr. Dieterich has published at Leiden: *Alfarabi's philosophische Abhandlungen* (1890; German trans. 1892); *Alfarabi's Abhandlung des Musterstaats* (1895; German trans. with an essay "Über den Zusammenhang der arabischen und der griechischen Staatslehre*" 1903; English translation of *Alfarabi* in German, with an essay on "Das Wesen der arabischen Philosophie" (1904).

**FARADAY, MICHAEL** (1791-1867), English chemist and physicist, was born at Newington, Surrey, on the 22nd of September 1791. His parents had migrated from Yorkshire to London, where his father worked as a blacksmith. Faraday himself became apprenticed to a bookbinder. The letters written to his friend Benjamin Abbott at this time give a lucid account of his aims in life, and of his methods of self-culture, when his mind was beginning to turn to the experimental study of nature. In 1812 Mr. D'Arcy, a customer of his master, took him to hear four lectures by Sir Humphry Davy. Faraday took notes of these lectures, and afterwards wrote them out in a fuller form. Under the encouragement of Mr. D'Arcy, he wrote to Sir H. Davy, enclosing these notes. "The reply was immediate, kind and favourable." He continued to work as a journeyman bookbinder till the end of 1813, when he was appointed assistant in the laboratory of the Royal Institution of Great Britain on the recommendation of Davy, whom he accompanied on a tour through France, Italy and Switzerland from October 1813 to April 1815. He was appointed director of the laboratory in 1825; and in 1833 he was appointed full professor of chemistry in the institution for life, without the obligation to deliver lectures. He thus remained in the institution for fifty-four years. He died at Hampton Court on the 25th of August 1867.

Faraday's earliest chemical work was in the paths opened by Davy, to whom he acted as assistant. He made a special study of chlorine, and discovered two new chlorides of carbon. He also made the first rough experiments on the diffusion of gases, a phenomenon first pointed out by John Dalton, the physical importance of which was more fully brought to light by Thomas Graham and Joseph Loschmidt. He succeeded in liquefying several gases; he investigated the alloys of steel, and produced several new kinds of glass intended for optical purposes. A specimen of one of these heavy glasses afterwards became historically important as the substance in which Faraday detected the rotation of the plane of polarization of light when the glass was placed in the magnetic field, and also as the substance which was first repelled by the poles of the magnet. He also endeavoured with some success to make the general methods of chemistry, as distinguished from its results, the subject of special study and of popular exposition. See his work on *Chemical Manipulation*.

But Faraday's chemical work, however important in itself, was soon completely overshadowed by his electrical discoveries. The first experiment which he has recorded was the production of a voltaic pile with seven halfpence, seven disks of sheet zinc, and six pieces of paper moistened with salt water. With this pile he decomposed sulphate of magnesia (first letter to Abbott, July 12, 1812). Henceforward, whatever other subjects might from time to time claim his attention, it was from among electrical phenomena that he selected those problems to which he applied the full force of his mind, and which he kept persistently in view, even when year after year his attempts to solve them had been baffled.

His first notable discovery was the production of the continuous rotation of magnets and of wires conducting the electric current round each other. The consequences deducible from the great discovery of H. C. Oersted (21st July 1820) were still in 1821 apprehended in a somewhat confused manner even by the foremost men of science. Dr. W. H. Wollaston indeed had formed the expectation that he could make the conducting wire rotate on its own axis, and in April 1821 he came with Sir H. Davy to the laboratory of the Royal Institution to make an experiment. Faraday was not there at the time, but coming in allude he heard the conversation on the expected rotation of the wire.

In July, August and September of that year Faraday, at the request of R. Phillips, the editor of the *Annals of Philosophy*, wrote for that journal an historical sketch of electro-magnetism, and he repeated almost all the experiments he described. This led him in the beginning of September to discover the method of producing the continuous rotation of the wire round the magnet, and of the magnet round the wire. He did not succeed in making the wire or the magnet revolve on its own axis. This first success of Faraday in electro-magnetic research became the subject of much ridicule, and a large number of impromptus against his honour. Into these we shall not enter, referring the reader to the *Life of Faraday*, by Dr. Bence Jones.

We may remark, however, that although the fact of the tangential force between an electric current and a magnetic pole was clearly stated by Oersted, and clearly apprehended by A. M. Ampère, Wollaston and others, the realization of the continuous rotation of the wire and the magnet round each other was a scientific puzzle requiring no mean ingenuity for its original solution. For on the one hand the electric current always forms a closed circuit, and on the other the two poles of the magnet have equal but opposite properties, and are inapparently connected, so that whatever tendency there is for one pole to circulate round the current in one direction is opposed by the equal tendency of the other pole to go round the other way, and thus the one pole can neither drag the other round and round the wire nor yet leave it behind. The thing cannot be done unless we adopt in some form Faraday's ingenious solution, by causing the current, in some part of its course, to divide into two channels, one on each side of the magnet, in such a way that during the revolution of the magnet the current is transferred from the current in the front of the magnet to the channel behind it, so that the middle of the magnet can pass across the current without stopping it, just as Cyrus caused his army to pass dryshoed over the Gylides by diverting the river into a channel cut for it in his rear.

We must now go on to the crowning discovery of the induction of electric currents.

In December 1824 he had attempted to obtain an electric current by means of a magnet, and on three occasions he had made elaborate but unsuccessful attempts to produce a current in one wire by means of a current in another wire or by a magnet. He still persevered, and on the 20th of August 1831 he obtained the first evidence that an electric current can induce another in a different circuit. On the 3rd of September he writes to his friend R. Phillips: "I am busy just now again on electromagnetism, and think I have got hold of a good thing, but can't say. It may be a weed instead of a fish that, after all my labour, I may at last pull up." This was his first successful experiment. In nine more days of experimenting he had arrived at the results described in his first series of "Experimental Researches" read to the Royal Society on the 24th of November 1831. By the intense application of his mind he had thus brought the new idea, in less than three months from its first development, to a state of perfect maturity.

During his first period of discovery, besides the induction of electric currents, Faraday established the identity of the electrification produced in different ways; the law of the definite electrolytic action of the current; and the fact, upon which he
laid great stress, that every unit of positive electrification is related in a definite manner to a unit of negative electrification, so that it is impossible to produce what Faraday called “an absolute charge of electricity” of one kind not related to an equal charge of the opposite kind. He also discovered the difference of the capacities of different substances for taking part in electric induction. Henry Cavendish had before 1773 discovered that glass, wax, resin and shellac have higher specific inductive capacities than air, and had actually determined the numerical ratios of these capacities, but this was unknown both to Faraday and to all other electricians of his time, since Cavendish’s Electrical Researches remained unpublished till 1789.

The first period of Faraday’s electrical discoveries lasted ten years. In 1831 he found that he required rest, and it was not till 1845 that he entered on his second great period of research, in which he discovered the effect of magnetism on polarized light, and the phenomena of diamagnetism.

Faraday had for a long time kept in view the possibility of using a ray of polarized light as a means of investigating the condition of transparent bodies when acted on by electric and magnetic forces. Dr Bence Jones (Life of Faraday, vol. i. p. 362) gives the following note from his laboratory book on the 10th of September 1822:—

“Polarized a ray of lamplight by reflection, and endeavoured to ascertain whether any depolarizing action (was) exerted on it by water placed between the poles of a voltaic battery in a glass cylinder; one of the glass’s through which was decomposed pure water, weak solution of sulphate of soda, and strong sulphuric acid; none of them had any effect on the polarized light, either when put out or of the circuit, so that no particular arrangement of particles could be ascertained in this way.”

Eleven years afterwards we find another entry in his notebook on the 2nd of May 1833 (Life, by Dr Bence Jones, vol. ii. p. 26). He then tried not only the effect of a steady current, but the effect on making and breaking contact.

“I do not think, therefore, that decomposing solutions or substances will be found to have (as a consequence of decomposition or arrangement) any effect on the energy of the polarized ray. Should now try non-decomposing bodies, as solid nitre, nitrate of silver, borax, glass, &c., whilst solid, to see if any internal state induced, which by decomposition is destroyed, i.e. whether, when they cannot decompose, any state of electrical tension is present. My borate of glass good, and common electricity better than voltaic.”

On the 6th of May he makes further experiments, and concludes:—“Hence I see no reason to expect that any kind of structure or tension can be rendered evident, either in decomposing or non-decomposing bodies, in insulating or conducting states.”

At last, in 1845, Faraday attacked the old problem, but this time with complete success. Before we describe this result we may mention that in 1862 he made the relation between magnetism and light the subject of his very last experimental work. He endeavoured, but in vain, to detect any change in the lines of the spectrum of a flame when the flame was acted on by a powerful magnet.

This long series of researches is an instance of his persistence. His energy is shown in the way in which he followed up his discovery in the single instance in which he was successful. The first evidence which he obtained of the rotation of the plane of polarization of light under the action of magnetism was on the 13th of September 1845, the transparent substance being his own heavy glass. He began to work on the 30th of August 1841 on polarization light passing through electrolytes. After three days he worked with common electricity, trying glass, heavy optical glass, quartz, Iceland spar, all without effect, as on former trials. On the 13th of September he worked with lines of magnetic force. Air, flint, glass, rock-crystal, calcareous spar were examined, but without effect.

“Heavy glass was experimented with. It gave no effect when the same magnetic poles or the contrary poles were on opposite sides (as respects the course of the polarized ray), nor when the same poles were on the same side at equal distances, or intervening power was applied. But when contrary magnetic poles were on the same side there was an effect produced on the polarized ray, and thus magnetic force and light were proved to have relations to each other. This fact will most likely prove exceedingly fertile, and of great value in the investigation of the conditions of nature.”

He immediately goes on to examine other substances, but with “no effect,” and he ends by saying, “Have got enough for to-day.” On the 18th of September he “does an excellent day’s work.” During September he had four days of work, and in October six, and on the 6th of November he sent in to the Royal Society the nineteenth series of his “Experimental Researches,” in which the whole science, and almost the phenomena are fully specified. The negative rotation in ferro-magnetic media is the only fact of importance which remained to be discovered afterwards (by M. E. Verdet in 1856).

But his work for the year was not yet over. On the 3rd of November a new horseshoe magnet came home, and Faraday immediately began to experiment on the action in the polarized ray through gases, but with no effect. The following day he repeated an experiment which had given no result on the 6th of October. A bar of heavy glass was suspended by silk between the poles of the new magnet, and he “found it to be impossible to get any rotation.” When it was arranged, and had come to rest, I found I could affect it by the magnetic forces and give it position.” By the 6th of December he had sent in to the Royal Society the twentieth, and on the 24th of December the twenty-first, series of his “Researches,” in which the properties of diamagnetic bodies are fully described. Thus these two great discoveries were elaborated, like his earlier one, in about three months.

The discovery of the magnetic rotation of the plane of polarized light, though it did not lead to such important practical applications as some of Faraday’s earlier discoveries, has been of the highest value to science, furnishing complete dynamical evidence that wherever magnetic force exists there is matter, small portions of which are rotating about axes parallel to the direction of that force.

We have given a few examples of the concentration of his efforts in seeking to identify the apparently different forces of nature, of his far-sightedness in selecting subjects for investiga- tion, of his persistence in the pursuit of what he set before him, of his energy in working out the results of his discoveries, and of the accuracy and completeness with which he made his final statement of the law of the phenomenon.

These characteristics of his scientific spirit lie on the surface of his work, and are manifest to all who read his writings. But there was another side of his character, to the cultivation of which he paid at least as much attention, and which was reserved for his friends, his family and his church. His letters and his conversations were always full of whatever could awaken a healthy interest, and free from anything that might rouse ill-feeling. When, on rare occasions, he was forced out of the region of science into that of controversy, he stated the facts and let them make their own way. He was entirely free from pride and undue self-assertion. During the growth of his powers he always thankfully accepted a correction, and made use of every expedient, however humble, which would make his work more effective in every detail. When at length he found his memory failing and his mental powers declining, he gave up, without ostentation or complaint, whatever parts of his work he could no longer carry on according to his own standard of efficiency. When he was no longer able to apply his mind to science, he remained content and happy in the exercise of those kindly feelings and warm affections which he had cultivated no less carefully than his scientific powers.

The parents of Faraday belonged to the very small and isolated Christian sect which is commonly called after Robert Sandeman. Faraday himself attended the meetings from childhood; at the age of thirty he made public profession of his faith, and during two different periods he discharged the office of elder. His opinion with respect to the relation between his science and his religion is expressed in a lecture on mental education delivered in 1854, and printed at the end of his Researches in Chemistry and Physiology.

“Before entering upon the subject, I must make one distinction which, however it may appear to others, is to me of the utmost importance. High as man is placed above the creatures around
him, there is a higher and far more exalted position within his view; and the ways are infinite in which he occupies his thoughts about the fears, or hopes, or expectations of a future life. I believe that the truth of that future cannot be brought to his knowledge by any exertion of his mental powers, however exalted they may be; that it is made known to him by other teaching than his own, and is received through simple belief of the testimony given. Let no one, therefore, think that the self-education I am about to recommend, in respect of the things of this life, can ever extend to considerations of the hope set before us, as if man by reasoning could find out God. It would be improper here to enter upon this subject farther than to mark an absolute distinction between religious and ordinary belief. I shall be reproached with the weakness of refusing to apply those mental operations which I think good in respect of high things to the very highest. I am content to bear the ridicule of those belief, and I believe in the other. The visible things of Him from the creation of the world are clearly seen, being understood by the things that are made, even His eternal power and Godhead; and I have never seen anything incompatible between those things of man which can be known by the spirit of man which is within him and those higher things concerning his future, which he cannot know by that spirit."

Faraday gives the following note as to this lecture:

"These observations were delivered as a lecture before His Royal Highness the Prince Consort and the members of the Royal Institution on the 6th of May 1854. They are so immediately connected in their nature and origin with my own experimental life, considered either as cause or consequence, that I have thought the close of this volume the proper place for their reproduction."

As Dr Bence Jones concludes—

"His standard of duty was supernatural. It was not founded on any intuitive ideas of right and wrong, nor was it fashioned upon any outward experiences of time and place, but it was formed entirely on what he held to be the revelation of the will of God in the whole world, and through all his life his faith led him to act up to the very letter of it."

Published Works.—Chemical Manipulation, being Instructions to Students in Chemistry (i vol., John Murray, 1st ed. 1827, 2nd ed. 1830, 3rd ed. 1842); Experimental Researches in Electricity, vols. i. and ii., Richard and John Edward Taylor, vols. i. and iii. (1836); Experimental Researches in Chemistry and Physics, Taylor and Francis (1836); On the Great Sacrifices of a Candle (edited by W. Crookes) (Griffin, Bohn & Co., 1861); On the Various Forces in Nature (edited by W. Crookes) (Chatto & Windus, no date).

FAHAR, a river of Afghanistan. It rises in the southern slopes of Shah-Koh, which forms the southern wall of the valley of Herat. How it flows south-west for 160 m. to the town of Seistan Hamun. At the town of Fahar it has a width of 150 yds. in the dry season with 2 ft. of water and a clear swift stream. It is liable to floods, when it becomes impassable for weeks. The lower valley of the Farah Rud is fertile and well cultivated.

FAHAR, a town of Afghanistan. It is situated on the river that bears its name on the main road between Herat and Kandahar, 160 m. S. of Herat and 225 m. W. of Kandahar. It is a place of some strategical importance, as it commands the approaches to India and Seistan from Herat. The town (2,465 ft. above sea-level) was formerly the walled district of Fahar (a corruption of Fahar, the principal city of the province of Burgh, or by the delineation of the play of character upon character, which is that of comedy. The history of the word is interesting. Its ultimate origin is the Latin farcire, to stuff, and with the meaning of "stuffing" or "foam" it appears in old cookery books in English. In medieval Latin farca and farcia were applied to the expansion of the Kyrie eleison in litanies, &c., by interpolating words and phrases between those two words; later, to words, phrases and rhymed verses, sometimes in the vernacular, also interpolated in various parts of the service. The French faux, the form to which we have returned, was introduced into the service of the stage, and medieval drama inserted into their parts, generally to meet the popular demand for a lightening of humour or buffoonery. It has thus been used for the lighter form of comic drama (see DRAMA), and also figuratively for a piece of idle buffoonery, sham, or mockery.

FAREHAM, a market town in the Fareham parliamentary division of Hampshire, England, 76 m. S.W. from London by the London & South Western railway. Pop. of urban district (1901) 8,246. It lies at the head of a creek opening into the north-western corner of Portsmouth harbour. The principal industries are the manufacture of wearing apparel, flour, coarse earthenware, terra-cotta, tobacco-pipes and leather. Fareham has a considerable trade in corn, timber and coal; the creek being accessible to vessels of 300 tons. Three miles E. of Fareham, on Portsmouth harbour, are the interesting ruins of Porchester.

FAIZ, a poet of the thirteenth century, was born in Herat, and received a thorough education in the Koran, the Hadith, the four great schools of theology, the science of genealogy, and the languages of ancient and modern India. He was the author of a collection of poems called "The Book of the World of Creation," which is famous in the Persian language. He died in 1253.

FAZAD, a town in the province of Seistan, Afghanistan. It is situated on the river Farah, which flows through the town. The town is noted for its cotton, silk, and wool textiles.
Castle, an extensive walled enclosure retaining its Norman keep, and exhibiting in its outer walls considerable evidence of Roman workmanship; Professor Haverfield, however, denies that it occupies the site of the Roman Portus Magnus. The church of St Mary has some fine Norman portions. It belonged to an Augustinian priory founded by Henry I. At Titchfield, 3 m. W. of Fareham, are ruins of the beautiful Tudor mansion, Place House, built on the site of a Premonstratensian abbey of the 13th century, of which there are also fragments.

The fact that Fareham (Farnham, Farnum) formed part of the original endowment of this priory and its existence center on or before the 9th century. It is mentioned in the Domesday Survey as subject to a reduced assessment on account of its exposed position and liability to Danish attacks. There is evidence to show that Fareham had become a borough before 1264, but no charter can be found. It was a mesne borough held by the bishop of Winchester, but it is probable that during the 18th century the privileges of the burgesses were allowed to lapse, as by 1835 it had ceased to be a borough. Fareham returned two members to the parliament of 1366, but two years later it petitioned against representation on the ground of expense. A fair on the site of Ockham and the two fairs a year were held with the grant of Henry III. The day appears to have been afterwards changed to the 26th of June, and in the 18th century it was mainly important for the sale of toys. It was abolished in 1871. Fareham owed its importance in medieval times to its facilities for commerce. It was a free port and had a considerable trade in wool and wine. Later its shipping declined and in the 16th century it was little more than a fishing village. Its commercial prosperity in modern times is due to its nearness to Portsmouth.

FAREL GUILLAUME (1480-1560), French reformer, was born of a noble family near Gap in Dauphiné in 1480. His parents meant him for the military profession, but his bent being for study he was allowed to enter the university of Paris. Here he came under the influence of Jacobus Faber (Stapulensis), on whose recommendation he was appointed professor in the college of Cardinal Lemoine. In 1521, on the invitation of Bishop Briçonnet, he repaired to Meaux, and took part in efforts of reform within the Roman communion. The persecuting measures of 1523, from which Faber found a refuge at Meaux, determined Farel to leave France. Oecolampadius welcomed him to Basel, where in 1524 he put forth thirteen theses sharply antithetical to the papal constitutions. On the 10th of June 1525 the council of two hundred had ordained that in every church and chapter of the city "the pure Gospel" should be preached; against this order the bishop's vicar led the opposition. Reaching Geneva in October 1532, Farel (described in a contemporary monastic chronicle as "un chétif malheureux prédicant, nommé maître Guillaume") at once began to preach in a room of his lodging, and soon attracted "un grand nombre de gens qui estoient advenus de sa venue et déjà infects de son hérésie." Summoned before the bishop's vicar, his trial was a scene of insult and clamour, ending in his being violently thrust from the court andidden to leave the city within three hours. He escaped with difficulty to Orbe by boat. Through the intervention of the government of Bern, liberty of worship was granted on the 28th of March 1533 to the Reformation party in Geneva. Farel, returning, achieved in a couple of years a complete supremacy for his followers. On New Year's Day 1534 the bishop interdicted all preaching un authorized by himself, and ordered the burning of all Protestant Books. This was the signal for public disputations in which it was too late for the leading party to take the Reformation side, with the result that by decree of the 27th of August 1536 the Reformed religion was suppressed and the reformed religion established. Calvin, on his way to Basel for a life of study, touched at Geneva, and by the importunity of Farel was there detained to become the leader of the Genevan Reformation. The severity of the disciplinary measures which followed procured a reaction under which Farel and Calvin were banished the city in 1538. Farel was called to Neuchâtel in July 1538, but his position there was made untenable, though he remained at his post during a visitation of the plague. When (1541) Calvin was recalled to Geneva, Farel returned; but twenty days were held before he was allowed to leave the Reformation there. It is said that when he preached in the Dominican church of Metz, the bells were rung to drown his voice, but his voice outdid the bells, and on the next occasion he had three thousand hearers. His work was checked by the active hostility of the duke of Lorraine, and in 1544 he returned to Neuchâtel. No one was more frequently and confidentially consulted by Calvin. When the trial of Servetus was in progress (1553), Calvin was anxious for Farel's presence, but he did not arrive till sentence had been passed. He accompanied Servetus to the stake, vainly urging him to a recantation at the last moment. A coolness with Calvin was created by Farel's marriage, at the age of sixty-nine, with a refugee widow from Rouen, of unsuitable age. By her, six years later, he had one son, who died in infancy. The vigour and fervency of his preaching were unabated by length of years. Calvin's death, in 1564, affected him deeply. Yet in his last year he revisited Metz, preaching amid great enthusiasm, with all his wonted fire. The effort was too much for him; he left the church exhausted, took to his bed, and died at Metz on the 13th of September 1565.

Farel wrote much, but usually in haste, and for an immediate purpose. He takes one hand and the other down to the last moment. He was a man of activity rather than of speculation or of much insight. His Sommaire was re-edited from the edition of 1534 by J. G. Baum in 1867. Others of his works (all in French) were his treatise on purgatory (1554), on the Lord's Prayer (1554), on the Supper (1555). He "was remarkable for boldness and energy both in preaching and prayer" (M. Young, Life of Palestrino). As an orator, he was denunciatory rather than suasive; thus while on the one hand he powerfully impressed, on the other hand he stimulated opposition. A monument to him was unveiled at Neuchâtel on the 4th of May 1876.

Lives of Farel are numerous; it may suffice to mention C. Ancillon, Vie de G. Farel (1861); the article in Bayle; M. Kirchhofer, Das Leben W. Farel (1831-1833); Ch. Schmidt, Études sur Farel (1834); G. Farel (1893); J. J. Herzog, in Herzog-Haupstädte L'encyclopédie (1868).
that Smith was his "Master and Instructor in Mineral Surveying," and his subsequent publications show how well he had profited by the teachings he received. Farey prepared the General View of the Agriculture and Minerals of Derbyshire in two vols. (1811-1813) for the Board of Agriculture. In the first of these volumes (1811) he gave an able account of the upper part of the British series of strata, and a masterly exposition of the Carboniferous and other strata of Derbyshire. In this classic work, and in a paper published in the Phil. Mag. vol. li. 1818, p. 173, on "Mr Smith's Geological Claims stated," he zealously called attention to the importance of the discoveries of William Smith. Farey died in London on the 6th of January 1826.

See Biographical Notice, by W. S. Mitchell, in Geol. Mag. 1873, p. 25.

**FARAGO, WILLIAM GEORGE** (1818-1881), pioneer American expressman, was born in Pompey, New York, on the 20th of May 1818. From the age of thirteen he had to support himself, obtaining little schooling, and for several years he was a clerk in grocery stores in Syracuse. He became a freight agent for the Auburn & Syracuse railway company at Auburn in 1841, an express messenger between Albany and Buffalo a year later, and in 1843 a resident agent in Buffalo. In 1844 he organized, with Henry Wells (1805-1878) and Daniel Dunning, the first express company (Wells & Co.; after 1845 Livingston & Fargo) to engage in the carrying business west of Buffalo. The lines of this company (which first operated only to Detroit, via Cleveland) were rapidly extended to Chicago, St Louis, and other western points. In 1850 he was chosen by Congress to be the first delegate to the American Express Company. In 1857 he became president and Fargo secretary. In 1854, with Wells and others, he organized the firm of Wells, Fargo & Company to conduct an express business between New York and San Francisco by way of the Isthmus of Panama and on the Pacific coast, where it long had a virtual monopoly. In 1861 Wells, Fargo & Co. bought and reorganized the Overland Mail Co., which had been formed in 1857 to carry the United States mails, and of which Fargo had been one of the original promoters. From 1862 to 1866 he was mayor of Buffalo, and from 1868 to his death, in Buffalo, on the 3rd of August 1881, he was president of the American Express Company, with which in 1868 the Merchants Union Express Co. was consolidated. He was a director of the New York Central and of the Northern Pacific railways.

**FARGO, a city and the county-seat of Cass county, North Dakota, U.S.A., about 254 m. W. of Duluth, Minnesota. Pop. (1890) 6604; (1900) 9580, of whom 2564 were foreign-born; (1910 census) 14,331.** It is served by the Northern Pacific, the Great Northern, and the Chicago, Milwaukee & St Paul railways. The city is situated on the W. bank of the Red river of the North, which in 1699 had a navigable depth of only about 2 ft. In 1875 it was the site of the first railroad town of the United States, having a fine masonic temple. There are a public library and a large Y.M.C.A. building. St John's hospital is controlled by Roman Catholic sisters, and St Luke's hospital by the Lutheran Church. Fargo is in a rich agricultural (especially wheat) region, is a busy grain-trading and jobbing centre, is one of the most important wholesale distributing centres for agricultural implements and machinery in the United States, and has a number of manufactures, notably flour. The total value of the city's factory products in 1905 was $1,165,832. Fargo, named in honor of W. G. Fargo, the Wells Fargo Express Company, was first settled as a tent city in 1871, when the Red river was crossed by the Northern Pacific, but was not permanently settled until after the extinction in 1873 of the Indian title to the reservation on which it was situated. It was chartered as a city in 1875. The Milwaukee railway was completed to Fargo in 1884. In June 1863 a large part of the city was destroyed by fire, the loss being more than $3,000,000.

**FARIA Y SOUSA, MANUEL DE** (1590-1649), Spanish and Portuguese historian and poet, was born of an ancient Portuguese family, probably at Pombro, on the 18th of March 1590, attended the university of Braga for some years, and when about fourteen entered the service of the bishop of Oporto. With the exception of about four years from 1631 to 1634, during which he was a member of the Portuguese embassy in Rome, the greater part of his later life was spent at Madrid, and there he died, after much suffering, on the 3rd of June 1649. He was a laborious, peaceful man; and a happy marriage with Catharina Machado, the Albonia of his poems, enabled him to lead a studious domestic life, dividing his cares and affections between his children and his books. His first important work, an **Epidemle de las historias de Portugueas** (Madrid, 1628), was favourably received; but some passages in his enormous commentary upon *Os Lusíadas*, the poem of Luís de Camoens, excited the suspicion of the inquisitors, caused his temporary incarceration, and led to the permanent loss of his official salary. In spite of the enthusiasm which is said to have prescribed to him the daily task of twelve folio pages, death overtook him before he had completed his greatest enterprise, a history of the Portuguese in all parts of the world. Several portions of the work appeared at Lisbon after his death, under the editorship of Captain Faria y Sousa—*Europa Portuguesa* (1665, 3 vols); *Asia Portuguesa* (1666-1675, 3 vols); *Afric Portuguesa* (1681). As a poet Faria y Sousa was nearly as prolific; but his poems are venerated by the prevailing Gon- gorism of his time. They were for the most part collected in the *Noches claras* (Madrid, 1624-1626), and the *Fuente de Aganipe*, of which four volumes were published at Madrid in 1644-1646. He also wrote, from information supplied by P. A. Semmedo, the *Império de China i cultura evangelica en él* (Madrid, 1642); and translated and completed the *Nobiliario* of the count of Castro afonso.

There are English translations by J. Stevens of the *History of Portugal* (London, 1698), and of *Portuguesa Asia* (London, 1695).**

**FARIBAULT, a city and the county-seat of Rice county, Minnesota, U.S.A., on the Cannon river, at the mouth of the Straight river, about 45 m. S. of St Paul. Pop. (1890) 6520; (1900) 7868, of whom 1386 were foreign-born; (1910) 8279; (1920) 9001. Fariabault is served by the Chicago Great Western, the Chicago, Milwaukee & St Paul, and the Chicago, Rock Island & Pacific railways. The city is attractively situated near a lake region widely known for its summer resorts. Faribault is the seat of the Minnesota institute for defectives, including the state school for the deaf (1863), the state school for the blind (1874), and the state school for the feeble-minded (1876); of three institutions under control of the Protestant Episcopal Church—the Seabury divinity school (incorporated 1866), the Shattuck school (1867; incorporated in 1905), a military school for boys, and St Mary's hall (1866), a school for girls, founded by Bishop Whipple; and of the Roman Catholic (Dominican) Bethlehem Academy for girls. In the city are the cathedral of our Merciful Saviour (1868-1866), the first Catholic church in the United States (1866), used as a cathedral from its opening; and the hospital and nurses' training school of the Minnesota District of the Evangelical
Synod. The city has a public library, and owns and operates its own water-supply system. There is a good water power, and among the city's manufactures are flour, beer, shoes, furnishing-rattan-ware, warehouse trucks, canned goods, cane syrup, waggons and carriages, gasolene engines, wind-mills, pianos and woolen goods. Faribault, named in honour of Jean Baptiste Faribault, a French fur-trader and pioneer who made his headquarters in the region in the latter part of the 18th century, was permanently settled about 1848, and was chartered as a city in 1872. A French millwright, N. La Croix, introduced here, about 1856, a new process of making flour, which revolutionized the industry in the United States, but his mill was soon destroyed by flood and he removed to Minneapolis, where the process was extensively used for many years. Faribault was for many years the home of Bishop Henry Benjamin Whipple (1822-1901), the pioneer bishop (1859-1901) of the Protestant Episcopal Church in Minnesota, famous for his missionary work among the Indians.

FARIDKOT, a native state of India in the Punjab. It ranks as one of the Cis-Sutlej states, which came under British influence in 1800. Its area is 642 sq. m., and its population in 1901 was 1,24,912. It is bounded on the W. and N.E. by the British district of Ferozepore, and on the S. by Nahha state. During the Sikh wars in 1845 the chief, Raja Pakhal Singh, entered himself in the British cause, and was rewarded with an increase of territory. In the Mutiny of 1857, 100, his son and successor, Wazir Singh, did good service by guarding the Sutlej ferries, and in attacking a notorious rebel, whose stronghold he destroyed. The estimated gross revenue is £8,300; there is no tribute. The territory is traversed by the Rewari-Ferozepore railway, and also crossed by the Fazilka line, which starts from Kotkapura, the old capital. It is irrigated by a branch of the Sindh canal. The town of Faridkot has a railway station, 84 m. from Lahore.

FARIDPUR, or FURREEPUR, a town and district of British India, in the Dacca division of eastern Bengal and Assam. The town, which has a railway station, stands on an old channel of the Ganges. Pop. (1901) 11,649. There are a Baptist mission and a government high school. The district comprises an area of 2281 sq. m. The general aspect is flat, tame and uninteresting, although in the northern tract the land is comparatively high, with a light sandy soil, covered with water during the rainy season, but dry during the cold and hot weather. From the town of Faridpur the ground slopes, until in the south, on the confines of Backergunj, it becomes one immense swamp, never entirely dry. Several small streams, and the headwaters of the district may be said to be under water. The villages are built on artificially raised sites, or the high banks of the deltaic streams. Along many of the larger rivers the line of hamlets is broken for miles together, so that it is difficult to say where one ends and another begins. The huts, however, except in markets and bazaars, are seldom close together, but are scattered amidst small garden plots, and groves of mango, date and betel-nut trees. The plains between the villages are almost invariably more or less depressed towards the centre, where usually a marsh, or lake, or deep lagoon is found. These marshes, however, are gradually filling up by the silt deposited from the rivers; in the north of the district there now only remain two or three large swamps, and in them the process may be seen going on. The climate of Faridpur is damp, like that of the other districts of eastern Bengal; the average annual rainfall is 66 in. and the average mean temperature 76° F.

The principal rivers of Faridpur are the Ganges, the Arial Khan and the Harihagara. The Ganges, or Padma as it is locally called, touches the extreme north-west corner of the district, flows along its northern boundary as far as Goolanda, where it receives the waters of the Jamuna or main stream of the Brahmaputra, and whence the united stream turns southwards and forms the eastern boundary of the district. The river is navigable by large cargo boats throughout the year, and has an average breadth during the rainy season of 1600 yds. Rice is the great crop of the district. In 1901 the population was 1,037,646, showing an increase of 6% in the decade. The north of the district is crossed by the line of the Eastern Bengal railway to Goolanda, the port of the Brahmaputra steamers, and a branch runs to Faridpur town. But most of the trade is conducted by river.

FARID UD-DIN 'ATTAR, or Ferid Edden-Athar (1119-1220), Persian poet and mystic, was born at Nishapur, 513 A.H. (1119 A.D.), and was put to death 627 A.H. (1229 A.D.), thus having reached the age of 110 years. The date of his death is, however, variously given between the years 1193 and 1235, although the majority of authorities support 1225; it is also probable that he was born later than 1191, but before 1150. His real name was Abu Ta'llib (or Abu Hamid) Mohammed ben Ibrahim, and he was born in a town of that name in Khorasan, near the Caspian Sea, and was educated at the court of the emperor. He is best known as a poet of Religion. He followed for a time his father's profession of druggist or perfumer, and hence the name 'Attar (one who sold ār, orro of roses; hence, simply, dealer in drugs), which he afterwards employed as his poetical designation. According to the account of Daulatshah, his interest in the great mystery of the higher life of man was awakened in the following way. One day a wandering fakir gazed sadly into his shop, and, when ordered to be gone, replied: "It is nothing for me to go; but I grieve for thee, O druggist, for how wilt thou be able to supply the draught of death, and leave all these goods of thine behind thee?" The word was in season; and Mohammed ben Ibrahim the druggist soon gave up his shop and began to study the mystic theosophy of the Sufis under Sheikh Rukneddin. So thoroughly did he enter, into the spirit of that religion that he was before long recognized as one of its principal representatives. He travelled extensively, visited Mecca, Egypt, Damascus and India, and on his return was invested with the Sufi mantle by Sheikh Majd-ud-din of Bagdad. The greater portion of his life was spent in the town of Shadylah, but he is not unfrequentedly named Nishapur, after the city of his boyhood and youth. The story of the Sufi is a strange one. After a long and successful life, when he had retired to the city of Faridpur, near Firozepore, and was, as people say, of the age of 30, he was asked by the ruler of another city, Khan, he was about to be sold for a thousand dirhems, when he advised his captor to keep him, as doubtless a larger offer would yet be made; but when the second bidder said he would give a bag of horse fodder for the old man, he asserted that he was worth no more, and had better be sold. The soldier, irritated at the loss of the first offer, immediately slew him. A noble tomb was erected over his grave, and the spot acquired a reputation for sanctity. Farid was a voluminous writer, and left no fewer than 120,000 couplets of poetry, though in his later years he carried his asceticism so far as to deny himself the pleasures of poetic composition. His most famous work is the Manûkṣî afغار, or language of birds, an allegorical poem containing a complete survey of the life and doctrine of the Sufis. It is extremely popular among Mahomedans both of the Sunni and Shiiite sects, and the manuscript copies are consequently very numerous. The birds, according to the poet, were tired of a republican constitution, and longed for a king. As the lapwing, having guided Solomon through the desert, best knew what a king should be, he was asked whom they should choose. The Simorg in the Caucasus, was his reply. But the way to the Caucasus was long and dangerous, and most of the birds excused themselves from the enterprise. A few, however, set out; but by the time they reached the great king's court, their number was reduced to thirty. The thirty birds (šî morg), wing-weary and hunger-stricken, at length gained access to their chosen monarch the Simorg; but only to find that they strangely lost their identity in his presence—that they are he, and he is they. In such strange fashion does the poet image forth the search of the human soul after absorption into the divine.

The text of the Manûkṣî afgar was published by Garcin de Tassy in 1857; a summary of its contents having already appeared as La Poésie philosophique et religieuse chez les Persans in 1856; it was succeeded by a complete translation in 1863. Among Farid ud-din's other works may be mentioned his Pándânama (Book of Counsel), of which a translation by Silvestre de Sacy appeared in 1816; Bâbûl (The Book of the Nightingale); Wâsâlet Name (Book of the junctions); Khûrûs va Gul (The King and the Rose); and Tadbîrata 'l Ausîyâ (Memoirs of the Saints) (ed. R. A. Nicholson in
FARINA—FARINI

FARINA, SALVATORE (1846– ), Italian novelist, was born in Sardinia, and after studying law at Turin and Pavia devoted himself to a literary life at Milan. Farina has often been compared as a sentimental humorist with Dickens, and his style of writing has given him a special place in modern Italian fiction. His masterpiece is Il Signor To (1888), a delightful portrait of an egoist; Don Chisciotello, Amore bendato, Capelli biondi; Oro nascosto, Il Tesoro di Donatina, Amore a centi ochi, which were somewhat marvellous. His name is strong in the southern market, for his fame is a tremendous canvas. Proceeding to tect, Miro slava, he executed a masterpiece; Labrador, a portrait of a great subject; and his name was written in many other works of mythologic excellence.

FARINATO, PAOLO (1522–1606), Italian painter and architect, was a native of Verona. He is sometimes named Farinato degli Uberti, as he came from the ancient Florentine stock to which the Ghibelline leader Farinato degli Uberti, celebrated in Dante's Convivioi, belonged. He flourished at the same time that the art of Verona obtained its greatest lustre in the works of Paolo Cagliari (Paul Veronese), succeeded by other members of the Cagliari family, of whom most or all were outlawed by Farinato. He was instructed by Niccolò Glinio, and probably by Antonio Badile and Domenico del Riccio (Broasoreci). Proceeding to Venice, he formed his personal friendship with Titian and Giorgione, though he was never conspicuous as a colourist, and in form he learned more from the works of Giulio Romano. His nude figures show knowledge of the antique; he affected a bronzed tone in the complexion, harmonizing with the general gravity of his colour, which is more luscious in fresco than in oil-painting. Vasari praised his thronged compositions and merit of draughtsmanship. His works are to be found not only in Venice and principally in Verona, but also in Mantua, Padua and other towns belonging or adjacent to the Venetian territory. He was a prosperous and light-hearted man, and continually prospered in his art, passing from a comparatively dry manner into a larger and bolder one, with much attraction of drapery and of landscape. The "Miracle of the Loaves and Fishes," painted in the church of S. Giorgio in Verona, is accounted his masterpiece; it was executed at the advanced age of seventy-nine, and is of course replete with figures, comprising those of the painter's own family. A saloon was painted by him in S. Maria in Organo, in the same city, with the subjects of "Michael expelling Lucifer" and the "Massacre of the Innocents"; in Piacenza is a "St Sixtus"; in Berlin a "Presenta- tion of the Temple"; and in the communal gallery at Titian and of his prime works, the "Marriage of St. Catherine." Farinato executed some sculptures, and various etchings of sacred and mythologic subjects; his works of all kinds were much in request, including the wax models which he wrought as studies for his painted figures. He is said to have died at the same hour as his wife. His son Orazio was also a painter of merit.

FARINELLI (1702-1782), whose real name was CARLO BRODIE, one of the most extraordinary singers that ever lived, was born on the 24th of January 1702, at Naples. He was the nephew of Cristiano Farinelli, the composer and violinist, whose name is synonymous with genius and perfection. When he was but a child he soon acquired, under the instruction of N. A. Porpora, a voice of marvellous beauty, and became famous throughout southern Italy as il ragazzo (the boy). In 1722 he made his first appearance at Rome in his master's Eumene, creating the greatest enthusiasm by surpassing a popular German trumpet-player, for whom Porpora had written an obligato to one of the boy's songs, in holding and swelling a note of prodigious length, purity and power, and in the variations, roulades and trills which he introduced into the air. In 1724 he appeared at Vienna, and at Venice in the following year, returning to Naples shortly afterwards. He sang at Milan in 1726, and at Bologna in 1727, where he first met and acknowledged himself vanquished by the singer Antonio Bernacchi (b. 1700), to whose instruction he was much indebted. With ever-increasing success and fame Farinelli appeared in nearly all the great cities of Italy; and returned a third time to Vienna in 1731. He now modified his style; it is said on the advice of Charles VI., from mere bravura of the Porpora school to one of pathos and simplicity. He visited London in 1734, arriving in time to lend his powerful support to the faction which in opposition to Handel had set up a rival opera with Porpora as composer and Senesino as principal singer. But not even his aid could make the undertaking successful. His first appearance at the Lincoln's Inn Fields theatre was in Ariasiss, much of the music of which was by his brother, Riccardo Broschi. His success was instantaneous, and the prince of Wales and the court loaded him with favours and presents. Having spent three years in England, Farinelli set out for Spain, staying a few months on the way in France, and sing at Angoulême in 1735. In 1737 he returned to France, and spent only a few months there before returning to London, where he was received at a service which extended nearly twenty-two years. His voice, employed by the queen to cure Philip V. of his melancholy madness, acquired for him an influence with that prince which gave him eventually the power, if not the name, of prime minister. This power he was wise and modest enough to use discreetly. For ten years, night after night, he had to sing to the king the same six songs, and never anything else. Under Ferdinand VI. he held a similar position, and was decorated (1756) with the cross of Calatrava. He utilized his ascendency over this king by persuading him to establish an Italian theatre in London, as a consequence of which he was succeeded by his son Charles III. Farinelli retired with the fortune he had amassed to Bologna, and spent the remainder of his days there in melancholy splendour, dying on the 15th of July 1782. His voice was of large compass, possessing seven or eight notes more than those of ordinary singers, and was sonorous, equal and clear; he also possessed a great knowledge of music.

FARINGDON, properly great Faringdon, a market town in the Abingdon parliamentary division of Berkshire, England, 17 m. W.S.W. of Oxford by road. Pop. (1891) 2900. It lies on the eastern border of Oxfordshire, 4 miles from the Thames at the source. It is the terminus of a branch of the London and Western railway from Uffington. The church of All Saints is a large cruciform building with low central tower. Its period is mainly Transitional Norman and Early English, and though considerably altered by restoration it contains some good details, with many monuments and brasses. Faringdon House, close to the church, was built by Henry James Pye (1745-1813), poet laureate from 1790 to 1813, who also caused to be planted the conspicuous group of fir-trees on the hill east of the town called Faringdon Clump, or locally (like other similar groups) the Faringdon audience. It is a fine example of a late Georgian house, designed by the architect John Wood the Elder (1704-1754) for the third Earl of Albemarle, who later sold it to the Duke of Grafton in 1820. The house has been altered and improved over the years, particularly in the 19th century, and now contains a collection of paintings and other decorative arts. The grounds are also historically significant, having been landscaped in the 18th century by Capability Brown.

FARINI, LUIGI CARLO (1818-1886), Italian statesman and historian, was born at Rupit, near Ravenna, on the 22nd of October 1812. After completing a brilliant university course at Bologna, which he interrupted to take part in the revolution of 1831 (see CARBONARI), he practised as a physician at Rupit and at Ravenna. He acquired a considerable reputation, but in 1843 his political opinions brought him under the suspicion of the police and caused his expulsion from the papal states. He resided successively in Florence and Paris, and travelled about Europe for the purpose of physicians of France, and was elected to the Chamber of Deputies in the July revolution of 1848, and was re-elected to the Chamber in the French elections of 1851. He was also elected to the Chamber of Deputies in the Italian elections of 1848, and was appointed secretary-general to G. Recchi, the minister of the interior (March 1848). But he held office for little more than a month, since like all the other Italian Liberals he disapproved of the pope's change of front in refusing to allow his troops to fight against Austria, and resigned with the rest of the ministry on the 29th of April, Pius IX., wishing to counteract the effect of this policy, sent Farini to Charles Albert, king of Sardinia, to hand over the command of the papal contingent to him. Elected member of parliament for Faenza, he was again appointed secretary to the ministry of the interior in the Marniani cabinet, and later director-general of the public health department. He resigned office on the proclamation of the republic after the flight of the pope to Gaeta in 1849, resumed it for a while when Pius returned to Rome with the protection of Napoleon III., and retired from public life in 1855.
of French arms, but when a reactionary and priestly policy was instituted, he went into exile and took up his residence at Turin. There he became convinced that it was only through the House of Savoy that Italy could be liberated, and he expounded his views in Cavour's paper Il Risorgimento, in La Fratella and Il Piemonte, of which latter he was at one time editor. He also wrote his chief historical work, Lo Stato Romano dal 1815 al 1830, in four volumes (Turin, 1859). In 1851 he was appointed minister of public instruction in the D'Azzeglio cabinet, an office which he held till May 1852. As a member of the Sardinian parliament and Junta (1851) Cavour was a critic of the supporters of Cavour (q.v.), and strongly favoured the proposal that Piedmont should participate in the Cisalpine, if indeed he was not actually the first to suggest that policy (see G. B. Ercolani's letter in E. Parri's memoir of Farini). In 1856 and 1857 he published two letters to Mr Gladstone on Italian affairs, which created a sensation, while he continued to propagate his views in the Italian press. When on the outbreak of the war of 1859 Francis V., duke of Modena, was expelled and a provisional government set up, Farini was sent as Piedmontese commissioner to that city; but although recalled after the peace of Villafranca, he was appointed on the annexation of central Italy to Piedmont and remained behind, becoming a Modenese citizen and dictator of the state. He negotiated an alliance with Parma, Romagna and Tuscany, when other provisional governments had been established, and entrusted the task of organizing an army for this central Italian league to General Fanti (q.v.). Annexation to Piedmont having been voted by pèbiscito and the opposition of Napoleon III. having been overcome, Farini returned to Turin, when the king conferred on him the order of the Annunziata and Cavour appointed him minister of the interior (June 1858), and subsequently viceroy of Naples: but he soon resigned on the score of ill-health. Cavour died in 1861, and the following year Farini succeeded Rattazzi as premier, in which office he endeavoured to carry out Cavour's policy. Over-exertion, however, brought on softening of the brain, which compelled him to resign office on the 24th of March 1863, and ultimately resulted in his death on the 1st of August 1866. He was buried at Turin, but in 1875 his remains were removed to his native village of Russi.

His son Domenico Farini had a distinguished political career and was at one time president of the chamber.

BIBLIOGRAPHY.—Several letters from Farini to Mr Gladstone and Lord John Russell were reprinted from the middle of the 19th century in les affaires d'Italie (1859), and a collection of his political correspondence was published under the title of Lettres sur les affaires d'Italie (Paris, 1860). His works were translated into English part in 1855 and four years later in a pirated edition. See E. Parri, Luigi Carlo Farini (Rome, 1878); L. Carpi in Il Risorgimento Italiano, vol. iv. (Milan, 1888); and G. Finali's article, "II 27 Aprile 1859," in the Nuova Antologia for the 10th of May 1903. (L. V.)

FARM, in the most generally used sense, a portion of land leased or held for the purpose of agriculture; hence "farming" is equivalent to the pursuit of agriculture, and "farmer" an agriculturist. This meaning is comparatively modern. The origin of the word has perhaps been complicated by an Anglo-Saxon form, meaning provisions or food supply, and more particularly a payment of provisions for the sustenance of the king, the cyninges form. In Domesday this appears as a food rent: fírma unius noccis or dict. According to the New English Dictionary there is no satisfactory Teutonic origin for the word. It has, however, been sometimes connected with a word which appears in the older forms of some Teutonic languages, meaning "life." The present form "farm" certainly comes, through the French ferme, from the Latin Lat. fírmas (firmus) and so means a fixed or certain payment in money or kind. The Anglo-Saxon form may not be an original Teutonic word but an early adaptation of the Latin. The fírma, originally a tax, seems, as the king "booked" his land, to have become a rent (see F. W. Maitland, Domesday Book and After, 1897, p. 236 ff., and J. H. Round, Feudal England, 1895, p. 109 ff.). The word fírma is thus used of the composition paid by the sheriff in respect of the dues to be collected from the shire. From the use of the word for the fixed sum paid as rent for a portion of land leased for cultivation, "farm" was applied to the land itself, whether held on lease or otherwise, and always with the meaning of agricultural land. The aspect of the fixity of the sum paid leads to a secondary meaning, that of a certain sum paid by a taxable person, community, state, &c., in respect of the taxes or dues that will be imposed, or to such a sum paid as a rent by a contractor for the right of collecting such taxes. This method of indirect collection of the revenue by contractors instead of directly by the officials of the state is that known as "farming the taxes." The system is best known through the publicani of Rome, who formed companies or syndicates to farm not only the indirect taxation of the state, but also other sources of the state revenues, such as mines, fisheries, &c. (see Publicani).

In monarchical Europe, which grew out of the ruins of the Roman empire, the revenue was almost universally farmed, but the system was gradually narrowed down until only indirect taxes became the subject of farming. France from the 16th to the 18th centuries is the most interesting modern example. Owing to the hopeless condition of its revenues, the French general government was generally in a state of anticipating its resources, and was thus entirely in the hands of financiers. In 1681 the indirect taxes were farmed collectively to a single company of forty capitalists (formes générales), increased to sixty in 1755, and reduced to the original number in 1780. These farmers-general were appointed by the king for six years, and paid an annual fixed sum every year in advance. The taxes which they collected were the customs (douanes or traites), the gabelle or salt tax, local taxes or octrois (entrées, &c.), and various smaller taxes. They were under the management of a controller-general, who had a central office in Paris. The office of farmer-general was the object of keen competition, not only because the successful candidates had to share a considerable part of the profits of the post with ministers, courtiers, favourites, and even the sovereign, in the shape of gifts (croupes) and pensions. The capacity of the farmers-general was proverbial, and the loss to the revenue by the system was great, while very considerable hardships were inflicted on the poorer contributors by the unscrupulous methods of collection practised by the underlings of the farmers. In addition, the unpatriotic nature of the taxes caused deep discontent, and the destitution in which the farmers-general were held culminated in the execution of thirty-two of them during the French Revolution and the sweeping away of the system.

FARM BUILDINGS. The best laying out of a farm, and the construction of its buildings, are matters which, from the variety of needs and circumstances, involve practical considerations and expert knowledge, too detailed in their nature for more than a brief reference in this work. It may be said generally that the best aspect for farm buildings is S. or S.S.E., and with a view to easy disposal of drainage they should be built on a slight slope. The supply of water, whether it be provided from wells by engine or windmill power, by hydraulic rams or other means, is a prime consideration, and it should if possible be laid on at different suitable points or at any rate the central source of supply should be in the most accessible and convenient place as regards stables and cow-sheds. The buildings should be constructed on or within easy distance of the public road, in order to save the upkeep of private roads, and should be as near as possible to the centre of the farm. On mixed farms of ordinary size (200 to 500 acres) the building may be advantageously planned in one or more parallel blocks, the stock-yards being placed in the centre separated by the cow-sheds, and surrounded by the cart-sheds, stables, stores and barn, cattle-boxes, piggeries and minor buildings. On farms of larger size and on dairy farms special needs must be taken into account, while in all cases the local methods of farming must influence the grouping and arrangement of the steadings.

For a more detailed treatment of the subject reference may be made to the following works:—S. Taylor, Modern Homesteads;
FARME R——FARMERS' MOVEMENT

FARMER, RICHARD (1735-1797). Shakespearian commentator, the son of a rich maltster, was born at Leicester on the 28th of August 1735. He was educated at the free grammar school of his native town, and at Emmanuel College, Cambridge. He graduated in 1757 a senior optime; three years later he proceeded M.A. and became classical tutor, and in 1775 master of his college, in succession to William Richardson, the biographer of the English bishops. In the latter year also he was appointed vice-chancellor, and three years afterwards chief librarian of the university. In 1780 he was appointed to a prebendal stall in Lichfield, and two years later to one at Canterbury; but the second office he exchanged in 1788 for that of a canon residentiary of St Paul's. Cambridge, where he usually resided, was indebted to him for improvements in lighting, paving and watching; but perhaps London and the nation have less reason to be grateful for his zealous advocacy of the custom of erecting monuments to departed worthies in St Paul's. In 1765 he issued a prospectus for a history of the town of Leicester; but this work, based on materials collected by Thomas Staveley, he never even began; it was carried out by the learned printer John Nichols. In 1766 he published his famous Essay on the Learning of Shakespeare, in which he proved that the poet's acquaintance with ancient and modern Continental literature was very limited, and also, derived from a translation of which he himself had even the blunders. "Shakespeare," he said, "wanted not the stilts of language to raise him above all other men." "He came out of nature's hand, like Pallas out of Jove's head, at full growth and maturity." "One might," he said—by way of ridiculing the Shakespearian criticism of the day—"with equal wisdom, study the Talmud for an exposition of Tristram Shandy." The essay fully justifies the author's description of himself in the preface to the second edition: "I may consider myself as the pioneer of the commentators; I have removed a deal of learned rubbish, and pointed out to them Shakespeare's track in the very pleasant paths of nature." Farmer died at Cambridge on the 8th of September 1797. He was, it appears, twice offered a bishopric by Pitt, but declined the preferment. Farmer was immensely popular in his own college, and loved, it was said, above all other things, old port, old clothes and old books.

FARMERS' MOVEMENT, in American political history, the general name for a movement between 1867 and 1896 remarkable for a radical socio-economic propaganda that came from what was considered the most conservative class of American society. In this movement there were three periods, popularly known as Granger, Alliance and Populist.

The Grange, or Order of the Patrons of Husbandry (the latter the official name of the national organization, while the former was the name of local chapters, including a supervisory National Grange at Washington), was a secret order founded in 1867 to advance the social needs and combat the economic backwardness of farm life. It grew remarkably in 1873-1874, and in the latter year attained a membership of perhaps 800,000. In the causes of its growth—much broader than those that issued in the financial crisis of 1873—a high tariff, railway freight-rates and other grievances were mingled with agricultural troubles like the fall of wheat prices and the increase of mortgages. The condition of the farmer seemed desperate. The original objects of the Grange were primarily educational, but these were soon overborne by an anti-middleman, co-operative movement.

Grange agents bought everything from farm machinery to women's dresses; hundreds of grain elevators and cotton and tobacco warehouses were bought, and even steamboat lines; mutual insurance companies were formed and joint-stock stores. Nor was co-operation limited to distributive processes; crop-reports were circulated, co-operative dairies multiplied, flour-mills were operated, and patents were purchased, that the Grange might manufacture farm machinery. The outcome in some states was ruin, and the name Grange became a reproach. Nevertheless these efforts in co-operation were exceedingly important both for the results obtained and for their wider significance. Nor could politics be excluded, though officially tatoosed; for economics must be considered by social idealists, and economics everywhere ran into politics. Thus it was with the railway question. Railways had been extended into frontier states, and were heavy crops in sparsely settled regions where freight-rates were high, so that—given the existing distributive system—there were "over production" and waste; there was notorious stock manipulation and discrimination in rates; and the farmers regarded "absentee ownership" of railways by New York capitalists much as absentee ownership of land has been regarded in Ireland. The Grange officially disclaimed eminity to railways; but though the organization did not attack them, the Grangers—through political "farmers' clubs" and the like—did. About 1867 began the efforts to establish regulation of the railways, as common-carriers, by the states. Especially in the old eastern "Granger laws," and in their general principles, soon endorsed (1876) by the Supreme Court of the United States, have become an important chapter in the laws of the land. In a declaration of principles in 1874 Grangers were declared to be "not enemies of railroads," and their cause to stand for "no communism, no agrarianism." To conservatives, however, co-operation seemed communism, and "Grange laws" agrarianism; and thus in 1875-1876 the growth of the movement aroused extraordinary interest and much uneasiness. In 1874 the order was reorganized, membership being limited to farmers and farm women. The "National Grange," founded in a millionaire manufacturers' Grange on Broadway), and after this there were constant quarrels in the order; moreover, in 1875 the National Grange largely lost control of the state Granges, which discredited the organization by their disastrous co-operation ventures. Thus by 1876 it had already ceased to be of national political importance. About 1880 a renaissance began, particularly in the Middle States and New England; this revival was marked by a recurrence to the original social and educational objects. The national Grange and state Granges (in all, or nearly all, of the states) were still active in 1905.

The Alliance carried the movement farther into economics. The "National Farmers' Alliance and Industrial Union," formed in 1889, embraced several originally independent organizations formed from 1873 onwards; it was largely confined to the South and was secret. The "National Farmers' Alliance," formed in 1889, went back similarly to 1877, was much smaller, Northern and non-secret. The "Colored Farmers' National Alliance and Co-operative Union" (formed 1888, merged in the above "Southern" Alliance in 1890) was the second greatest organization. With these three were associated many others, state and national, including an annual, non-partisan, deliberative and advisory Farmers' National Congress. The Alliance movement reached its greatest power about 1890, in which year twelve national farmers' organizations were represented in conventions in St Louis, and the six leading ones alone probably had a membership of 5,000,000.

As with the Grange, so in the ends and declarations of the whole later movement, concrete remedial legislation for agricultural or economic ills was mingled with principles of vague radical tendency and with lofty idealism. Among the principles

1 Membership usually included males or females above 16 years of age.

2 Thus, the "Southern" Alliance in 1890 (the chief platforms were the one at Ocala, Florida, and that of 1899 at St Louis, in conjunction with the Knob Creek and Butler's Cove resolutions to the

1 (1) To labour for the education of the agricultural classes in the science of economical government in a strictly non-partisan way, and to bring about a more perfect union of such classes. (2) To
advocated about 1890, practically all the great organizations demanded the abolition of national banks, the free coinage of silver, a "sufficient" issue of government paper money, tax revision, and a secret ballot (the last was soon rejected). One less commonly demanded wealth an income tax, taxation of evidence of debt, and government loans on lands. All of these were principles of the two great alliances (the Northern and the Southern), as were also pure food legislation, abolition of landholding by aliens, reclamation of unused or unearned land grants (to railways, e.g.), and either rigid federal regulation of railways and other means of communication or government ownership thereof. The "Southern" alliance put in the forefront a "sub-
treasury" scheme according to which cheap loans should be made by government from local sub-treasuries on non-ferishable farm products (such as grain and cotton) stored in government warehouses; while the "Northern" alliance demanded restriction of the liquor traffic and (for a short time) woman suffrage. Still other issues were a modification of the patent laws (e.g., to prevent the purchase of patents to stifle competition), postal currency exchange, the eight-hour day, inequitable taxation, the single-tax on land, "trusts," educational qualification for suffrage, direct popular election of federal judges, of senators, and of the president, special-interest lobbying, &c.

In 1859-1860 the political (non-partisan) movement developed astonishing strength; it captured the Republican stronghold of Kansas, brought the Democratic party to vassalage in South Carolina, revolutionized rail rates even by comparison with, say, Massachusetts, and seemed likely completely to dominate the South and West. All its work in the South was accomplished within the old-party organizations, but in 1859 the demand became strong for an independent third party, for which various consolidations since 1857 had prepared the way, and by 1862 a large part of the strength of the farmers' organizations, with that of various industrial and radical orders, was united in the People's Party (perhaps more generally known as the Populist Party), which had its beginnings in Kansas in 1859, and received national organization in 1862. This party emphasized free silver, the income tax, eight-hour day, reclamation of land grants, government ownership of railways, telephones and telegraphs, popular election of federal senators, and the initiative and referendum. In the presidential election of 1862 it cast 1,041,021 votes (in a total of 12,036,089), and elected 22 presidential electors, the first chosen by any third party since 1856. In 1866 the People's party fused with the Democratic Party (q.v.) in the presidential campaign, and again in 1900; during this period, indeed, the greatest part of the People's Party was reabsorbed into the two great parties from which its membership had originally been drawn; in some northern states apparently largely into the Republican party and more largely into the Democratic Party, to which it gave a powerful radical impulse.

The Farmers' movement was much misunderstood, abused and ridiculed. It accomplished a vast amount of good. The movement—and especially the Grange, for on most important points the later movements only followed where it had led—contributed the initial impulse and prepared the way for the establishment of travelling and local rural libraries, reading courses, lyceums, farmers' institutes (a steadily increasing influence) and rural free mail delivery (inaugurated experimentally in 1860 and afterwards as part of the permanent postal system of the country in 1902); for agricultural exhibits and an improved agricultural press; for encouragement to and increased profit from the work of agricultural colleges, the establishment (1855) and great services of the United States Department of Agri-
demand equal rights to all, and special privileges to none. (3) To endorse the motto: 'In things essential, unity; in all things, charity.' (4) To develop a better state, mentally, morally, socially and financially; (5) To suppress personal, local, sectional and national prejudices.

For the Southern farmer in a conservative state evil was the pre-crop mortgages by which cotton farmers remained in debt to country merchants; in the North the farmer attacked a wider evil of "capitalistic" legislation that hurt him, he believed, for the benefit of other classes—not legislation sought by railways.

culture,—in short, for an extraordinary lessening of rural isolation and betterment of the farmers' opportunities; for the irrigation of the semi-arid West, adopted as a national policy in 1902, the reclamation acts of 1905, the interstate-commerce law of 1887, the railway-rate laws of 1910, and 1910, even the great Bureau of Commerce-and-Labor law of 1903, and the Anti-trust laws of 1901 and later. The Alliance and Populist movements were bottomed on the idea of "ethical gains through legislation." In its local manifestations the whole movement was often marked by eccentric ideas, narrow prejudices and weaknesses in economic reasoning. It is not to be forgotten that owing to the movement of the frontier the United States has always been "at once a developed country and a primitive one. The same political questions have been put to a society advanced in some regions and undeveloped in others. . . . On specific political questions each economic area has reflected its pecular interest" (Prof. F. J. Turner). That this idea must not, however, be over-emphasized, is admirably enforced by observing the great mass of farmer radicalism that has, since about 1865, become an accepted Democratic and Republican principle over the whole country. The Farmers' movement was the beginning of widespread, effective protest against "the menace of privilege" in the United States.

FARNBY (or Farnbe), THOMAS (c. 1515-1647), English grammarian, was the son of a London carpenter; his grandfather, it is said, had been mayor of Truro, his great-grandfather an Italian musician. Between 1550 and 1555 he appears successively as a student of Merton College, Oxford, a pupil in a Jesuit college in Spain, and a follower of Drake and Hawkins. After some military service in the Low Countries he "made shift," says Wood, "to set on shore in the western part of England; where, after some wandering to and fro under the name of Tho. Balmute, the anagram of his surname, he settled at Martock, where he spent his lifetime in simple industry, and attained to the greatest success. After he had gotten some feathers at Martock, he took his flight to London," and opened a school in Goldsmiths' Rents, Cripplegate. From this school, which had as many as 300 pupils, there issued, says Wood, "more churchmen and statesmen than from any school taught by one man in England." In the course of his London career he "was made master of arts of Cambridge, and soon after incorporated at Oxon." Such was his success that he was enabled to buy an estate at Otford near Sevenoaks, Kent, to which he retired from London in 1636, still, however, carrying on his profession of schoolmaster. In course of time he added to his Otford estate and bought another near Horsham in Sussex. In politics he was a royalist; and, suspected of participation in the rising near Tunbridge, 1643, he was imprisoned in Ely House, Holborn. He died at Sevenoaks on the 12th of June 1647.

The details of his life were derived by Anthony Wood from Francis, Farnaby's son by a second marriage (see Wood's Adventurers of Oxonienses, ed. Bliss, iii. 215). His works chiefly consisted of annotated editions of Latin authors—Juvenal, Persius, Seneca, Martial, Lucan, Virgil, Ovid and Terence; which enjoyed extraordinary popularity. His Systema grammaticum et etymologicum of 1641. On the 6th of April 1632, Farnaby was presented with a royal patent granting him, for the space of twenty-one years, the sole right of printing and publishing certain of his works.

FARNBOROUGH, FRANCIS (1815-1880), English Constitutional historian, was born in London on the 8th of February 1815 and educated at Bedford grammar school. In 1831 he was nominated by Manners Sutton, speaker of the House of Commons, to the post of assistant librarian, so that his long connexion with parliament began in his youth.
He studied for the bar, and was called at the Middle Temple in 1838. In 1844 he published the first edition of his Treatise on the Law, Privilege, Proceedings and Usage of Parliament. This work, which has passed through many editions, is not only an invaluable mine of information for the historical student, but it is known as the text-book of the law by which Parliament governs its proceedings. In 1846 Erskine May was appointed examiner of petitions for private bills, and the following year taxing-master of the House of Commons. He published his Remarks to Facilitate Public Business in Parliament in 1849; a work On the Consolidation of Election Laws in 1850; and his Rules, Orders and Forms of the House of Commons was printed by command of the House in 1854. In 1856 he was appointed clerk assistant at the table of the House of Commons. He received the companionship of the Bath in 1860 for his parliamentary services, and became a knight commander in 1866. His important work, The Constitutional History of England since the Accession of George III. (1760-1860), was published in 1867-1868, and it received frequent additions in subsequent editions. In 1871 Sir Erskine May was appointed clerk of the House of Commons. His Democracy in Europe: a History appeared in 1877, but it failed to take the same rank in critical esteem as his Constitutional History. He retired from the post of clerk to the House of Commons in April 1886, having for fifteen years discharged the onerous duties of the office with as much knowledge and energy as unflagging tact and courtesy. Shortly after his retirement from office he was raised to the peerage under the title of Baron Farnborough of Farnborough, in the county of Southampton, but he only survived to enjoy the dignity for a few months. He died at Bath on 17th of May 1886, and as he left no issue the title became extinct.

FARNBOROUGH, an urban district in the Basingstoke parliamentary division of Hampshire, England, 33 m. S.W. by W. from London, on the London & South Western and the South Eastern & Chatham railways. Pop. (1901) 11,500 (including 5070 military). The church of St Peter ranges from Early English to Perpendicular in style. St Michael's Catholic memorial church, erected in 1887 by the ex-empress Eugénie, contains the remains of Napoleon III. and the prince imperial. An adjoining abbey is occupied by Benedictine fathers of the French congregation; the convent is a ladies' boarding-school. Aldershot North Camp is within the parish.

FARNE ISLANDS [also FARNE, FERN, OR THE STAPLES], a group of rocky islands and reefs off the coast of Northumberland, England, included in that county. In 1901 they had only eleven inhabitants. They extend in a line of some 6 m. in a north-easterly direction from the coast, on which the nearest villages are Bamborough and North Sunderland. The Fairway, 15 m. across, separates the largest island, Farne, or House, from the mainland. Farne is 16 acres in area, and has precipitous cliffs up to 50 ft. in height on the east, but the shore is otherwise low. The other principal islets are Staple, Brownman, North and South Wamses, Longstone and Big Harcar. On Farne is a small ancient chapel, with a square tower near it built for purposes of defence in the 15th century. The chapel is believed to occupy the site of St Cuthbert's hermitage, whither he retired from the priory on the neighbouring Holy Island or Lindisfarne. He was with difficulty persuaded to leave it on his elevation to the bishopric of Lindesfarne, and returned to it to die (688). Longstone rock, with its lighthouse, is famous as the scene of the bravery of Grace Darling in rescuing some of the survivors of the wreck of the "Forfarshire" (1838). The rocks abound in sea-birds, including eider duck.

FARNSE, the name of one of the most illustrious and powerful Italian families, which besides including eminent prelates, statesmen and warriors among its members, ruled the duchy of Parma for two centuries. The early history of the family is involved in obscurity, but they are first heard of as lords of Farneto or Farnese, a castle near the lake of Bolsena, and they played an important part as consuls and signori of Orvieto. They seem to have always been Guelphs, and in the civil broils of Orvieto they sided with the Monaldeschi faction against the Gibelline Filippeschi. One Pietro Farnese commanded the papal armies under Paschal II. (1099-1118); another Pietro led the Florentines to victory against the Pisans in 1563. Ranuccio Farnese served Eugene IV. so well that the pope endowed him with large fiefs, and is reported to have said, "The Church is ours because Farnese has given it back to us."

The family derived further advantages at the time of Pope Alexander VII., who was the lover of the beautiful Giulia Farnese, known as Giulia Bella, and created her brother Alessandro a cardinal (1493). The latter was elected pope as Paul III. in 1534, and it is from that moment that the great importance of the family dates. An unblushing nepotist, he alienated immense fiefs belonging to the Holy See in favour of his natural children. Of these the most famous was Pierluigi Farnese (1503-1547), who served in the papal army in various campaigns, but also took part in the sack of Rome in 1527. On his father's elevation to the papacy he was made captain-general of the Church, and received the duchy of Castro in the Maremma, besides Frascati, Nepi, Montalto and other fiefs. A shameless rake and a man of uncontrollable temper, his massacre of the people of Perugia after a rebellion in 1540 and the unspeakable outrage he committed on the bishop of Fano are typical of his character. In 1545 his father conferred on him the duchy of Parma and Piacenza, which likewise belonged to the Holy See, and his rule proved cruel and tyrannical. He deprived the nobles of their privileges, and forced them to dwell in the towns, but to some extent he improved the conditions of the lower classes. Pierluigi being an uncompromising opponent of the emperor Charles V., Duke Ferrante Gonzaga, the imperial governor of Milan, was ever on the watch for pretext to deprive him of Piacenza, which the emperor greatly coveted. When the duke proceeded to build a castle in that town in order to overawe its inhabitants, the nobles were furiously indignant, and a plot to murder him was organized by the marquis Anguissola and others with the support both of Gonzaga and of Andrea Doria (q.v.), Charles's admiral, who wished to be revenged on Pierluigi for the part he had played in the Fiesco conspiracy (see Fiesco). The deed was done while the duke was superintending the building of the above-mentioned citadel, and his corpse was flung into the street (March 15th, 1547). Piacenza was thereupon occupied by the imperialists.

Pierluigi had several children, for all of whom Paul made generous provision. One of them, Alessandro (1520-1589), was created cardinal at the age of fourteen; he was a man of learning and artistic tastes, and lived with great splendour surrounded by scholars and artists, among whom were Annibal Caro, Paolo Giovio, Mons. Della Casa, Bomasi, Vasari, &c. It was he who completed the magnificent Farnese palace in Rome. He displayed diplomatic ability on various missions to foreign courts, but failed to get elected to the papacy.

Orazio, Pierluigi's third son, was made duke of Castro when his father became duke of Parma, and married Diane, a natural daughter of Henry II. of France. Ottavio, the second son (1521-1586), married Margaret, the natural daughter of Charles V. and widow of Alessandro de' Medici, at the age of fifteen, she being a year older; at first she disliked her youthful bridegroom, but when he returned wounded from the expedition to Algiers in 1541 her aversion was turned to affection (see MARGARET OF AUSTRIA). Ottavio had been made lord of Camerino in 1540, but he gave up that fief when his father became duke of Parma. He was one of the murderers of the latter in 1547. Parma was thus occupied by the imperialists, Paul determined to make an effort to regain the city; he set aside Ottavio's claims to the succession of Parma, where he appointed a papal legate, giving him back Camerino in exchange, and then claimed Piacenza of the emperor, not for the Farnesi, but for the Church. But Ottavio would not be put off; he attempted to seize Parma by force, and having failed, entered into negotiations with Gonzaga. This unnatural rebellion on the part of one grandson, combined with the fact that it was supported by the other grandson, Cardinal Alessandro, hastened the pope's death, which occurred on the 10th of November 1549. During the interregnum that followed Ottavio
again tried to induce the governor of Parma to give up the city to him, but met with no better success; however, on the election of Giovanni Maria Ciocchi (Julius III.) the duchy was conferred on him (1551). This did not end his quarrel with the emperor, for Gonzaga refused to give up Piacenza and even threatened to encamp Parma, so that Ottavio was driven into the arms of France. Julius, who was anxious to be on good terms with Charles on account of the council of Trent which was then sitting, ordered Farnese to hand Parma over to the papal authorities once more, and on his refusal hurled censures and admonitions at his head, and deprived him of his Roman fiefs, while Charles did the same with regard to those in Lombardy. A French army came to protect Parma, war broke out, and Gonzaga at once laid siege to the city. But the duke came to an arrangement with his father-in-law, by which he regained Piacenza and his other fiefs. The rest of the life is spent quietly at home, where the moderation and wisdom of his rule won for him the affection of his people.

At his death in 1586 he was succeeded by his son Alessandro Farnese (1545-1592), the famous general of Philip II. of Spain, who spent the whole of his reign in the Flemish wars.

The first years of the reign of his son and successor Ranuccio I. (1569-1622), who had shown much spirit in a controversy with Pope Sixtus V., were uneventful, but in 1611 a conspiracy was formed against him by a group of discontented nobles supported by the dukes of Modena and Mantua. The plot was discovered and the conspirators were barbarously punished, many being tortured before their death. But with the death of Ranuccio was a reserved and gloomy bigot; he instituted savage persecutions against supposed witches and heretics, and lived in perpetual terror of plots. His eldest son Alessandro being dead and dumb, the succession devolved on his second son Odoardo (1612-1646), who fought on the French side in the war against Spain. His failure to pay the interest of the money borrowed in Rome, and the desire of Urban VIII. to obtain Castro for his relatives the Barberini (q.v.), resulted in a war between that pope and Odoardo. His son and successor Ranuccio II. (1620-1663) also had a war with the Holy See about Castro, which was eventually razed to the ground. His son Francesco Maria (1678-1727) suffered from the wars between Spain and Austria, the latter's troops devastating his territory; but although this obliged him to levy some burdensome taxes, he was a good ruler and practised economy in his administration. Having no children, the succession devolved at his death on his brother Antonio (1679-1731), who was also childless. The powers had agreed that at the death of the latter the duchy should pass to Don Carlos of Bourbon, son of King Philip V. of Spain by Elisabetta Farnese (1692-1766), granddaughter of Ranuccio I., who died in 1731, and with him the line of Farnese came to an end.

The Palazzo Farnese in Rome, one of the finest specimens of Roman Renaissance architecture, was begun under Paul III., while he was cardinal, by Antonio da San Gallo, and completed by his nephew Cardinal Alessandro under the direction of Michelangelo (1526). It was inherited by Don Carlos, afterwards king of Naples and Spain, and most of the pictures were removed to Naples. It now contains the French embassy to the Italian court, as well as the French school of Rome.

B. G. de Maricq gives a detailed history of the family in P. Litta's Famiglie celesti italiane, vol. x. (Milan, 1868), to which an elaborate bibliography is appended, including manuscript sources; a more recent bibliography is by S. Lottici and G. Sitti, Bibliografia generale per la storia parmesana (Parma, 1904); much information will be found in A. von Reumont's Geschichte der Stadt Rom, vol. iii. (Berlin, 1868), and in F. Gregorovius's Geschichte der Stadt Rom (Stuttgart, 1872).
of the Northern Provinces. Never was there a better opportunity than the end of 1580 for an invading army to march through the country almost without opposition. The misgoverned and lack of high statesmanship of the earl of Leicester had caused faction to be rampant in the United Provinces; and on his return to England he left the country without organized forces or experienced generals to oppose an advance of a veteran army under the greatest commander of his time. But Philip's whole thoughts and energies were already directed to the preparation of an Invincible Armada for the conquest of England, and Parma was ordered to collect an enormous flotilla of transports and to keep his army concentrated and trained for the projected invasion of the island realm of Queen Elizabeth. This plan was so far successful that Parma had already dispersed the defeated remnants of the Great Armada the Dutch had found a general, in the youthful Maurice of Nassau, worthy to be the rival in military genius even of Alexander of Parma. Moreover, the accession to the throne of France of Henry of Navarre had altogether altered the situation of affairs, and relieved the pressure upon the Dutch by creating a diversion, and placing Parma and his army between hostile forces. The ruinous expenditure upon the Great Armada also depleted the Spanish treasury and Philip found himself virtually bankrupt. In 1590 the foundation of the Spanish troops was found intolerable. Farnese could get no regular supplies of money from the king for the payment of the soldiery, and he had to pledge his own jewels to meet the demand. A mutiny broke out, but was suppressed. In the midst of these difficulties Parma received orders to abandon the task on which he had spent himself for so many years, and to raise the siege of Paris, which was blockaded by Henry IV. He left the Netherlands on the 3rd of August 1590 at the head of 15,000 troops. By brilliant generalship he outwitted Henry and succeeded in relieving Paris; but owing to lack of money and supplies he was compelled immediately to retreat to the Netherlands, abandoning to his enemies the marching post and camp, which he had been able to fortify. Farnese could not take up a regular career by the payment of the soldiery and leave all the positions he had taken to be recaptured by Henry.

Again in 1591, in the very midst of a campaign against Maurice of Nassau, sorely against his will, the duke of Parma was obliged to give up the engaging struggle and march to relieve Rouen. He was again successful in his object, but was wounded in the arm before Caudebec, and was finally compelled to withdraw his army with considerable losses through the privations the troops had to undergo. He himself was shattered in health by so many years of continuous campaigning and the cares and disappointments which had befallen him. He died at Arras on the 3rd of December 1592, in the forty-seventh year of his age. The feeling that his immense services had not won for him either the gratitude or confidence of his sovereign hastened his end. He was honoured by a splendid funeral at Brussels, but his body was interred at his own capital city of Parma. He left two sons, Ranuce, who succeeded him, and Edward, who was created a cardinal in 1591 by Pope Gregory XIV. His daughter Margaret married Vincent, duke of Mantua.

See L. P. Gachard, Correspondence d'Alexandre Farnese; Prince de Parma, par le general des Peis-Bois, et Philippe II, 1576-1579 (Brussels, 1850); Fra Pietro, Alessandro Farnese, duca di Parma (Rome, 1836).

FARNESE, ELIZABETH (1562-1576), queen of Spain, born on the 25th of October 1602, was the only daughter of Odoardo II., prince of Parma. Her mother educated her in strict seclusion, but seclusion altogether failed to tame her impetuous and ambitious temper. At the age of twenty-one (1714) she was married by proxy at Parma to Philip V. of Spain. The marriage was arranged by Cardinal Alberoni (q.v.), with the concurrence of the Princess des Ursins, the Camera Mayor. On arriving at the borders of Spain, Elizabeth was met by the Princess des Ursins, but received her sternly, and, perhaps in accordance with a plan previously concerted with the king, at once ordered her to be removed from her presence and from Spain. Over the weak king Elizabeth quickly obtained complete influence. This influence was exerted altogether in support of the policy of Alberoni, that chief aim of which was to recover the ancient Italian possessions of Spain, and which actually resulted in the seizure of Sardinia and Sicily. So vigorously did she enter into this policy that, when the French forces advanced to the Pyrenees, she placed herself at the head of one division of the Spanish army. But Elizabeth's ambition was grievously disappointed. The Triple Alliance thwarted her plans, and at length in 1720 the allies made the abdication of Alberoni a condition of peace. Sicily also had to be evacuated. And finally, all her entreaties failed to prevent the abdication of Philip, who in 1724 gave up the throne to his heir, and retired to the palace of La Granja. This plan was frustrated by the sudden death of the young king, and his accession to the throne. During his later years, when he was nearly imbecile, she directed the whole policy of Spain so as to secure thrones in Italy for her sons. In 1726 she had the satisfaction of seeing her favourite scheme realized in the accession of her son Don Carlos (afterwards Charles III. of Spain) to the throne of the Two Sicilies and his recognition by the powers in the treaty of Vienna. Her second son, Philip, became duke of Parma. Elizabeth survived her husband twenty years, dying in 1766.

See Mémoires pour servir à l'histoire d'Espagne sous le règne de Philippe V, by the Marquis de St. Philippe, translated by Maudgrave (Paris, 1766); Memoirs of Elizabeth Farnese (London, 1760); and E. Armstrong, Elizabeth Farnese, the Ternagant of Spain (1892).

FARNHAM, a market town in the Guildford parliamentary division of Surrey, England, 37½ m. S.W. by W. from London by the London & South Western railway. Pop. of urban district (1901) 6124. It lies on the left bank of the river Wey, on the southern slope of a hill rising about 700 ft. above the sea-level. The church of St Andrew is a spacious transitional Norman and Early English building, with later additions, and was formerly a chapel of ease to Waverley Abbey, of which a fragment and fragmentary remains, of Early English date, stand in the churchyard, and has been adapted to a modern residence by the present owner. This was the earliest Cistercian house in England, founded in 1128 by William Gifford, bishop of Winchester. The Annales Waveriensis, published by Gales in his Scriptores and afterwards in the Record series of Chronicles, are believed to have suggested to Sir Walter Scott the name of his first novel. Farnham Castle, on a hill north of the town, the seat of the bishops of Winchester, was first built by Henry de Blois, bishop of Winchester, and brother of King Stephen; but it was razed by Henry III. It was rebuilt and garrisoned for Charles I. by Denham, from 1646 to 1649, and subsequently dismantled, and it was only restored by George Morley, bishop of Winchester (1662-1684). Farnham has a town hall and exchange in Italian style (1866), a grammar school of early foundation, and a school of science and art. It was formerly noted for its cloth manufacture. Hops of fine quality are grown in the vicinity. William Cobbett was born in the parish (1760), and is buried in the churchyard of St Andrew's. The neighbouring mansion of Moor Park was the residence of Sir William Temple (d. 1699), and Swift worked here as his secretary. Hester Johnson, Swift's "Stella", was the daughter of Temple's steward, whose cottage still stands. The town has a grammar school as a residential centre from the proximity of Aldershot Camp (3 m. N.E.).

Though there is evidence of an early settlement in the neighbourhood, the town of Farnham (Ferneham) seems to have grown up round the castle of the bishops of Winchester, who possessed the manor at the Domeday Survey. Its position at the junction of the Pilgrim's Way and the road from Southampton to London was important. In 1205 Farnham had bailliages, and in 1207 it was definitely a mesne borough under the bishops of Winchester. In 1247 the bishop granted the first charter, giving, among other privileges, a fair on All Saints' Day. The burgesses surrendered the proceeds of the borough court and other rights in 1365 in return for reprieve of the fee farm rent; these were recovered in 1405 and rent again paid. Bishop Waynlete is said to have confirmed the original charter in 1452, and in 1566 Bishop Hone
granted a new charter by which the burgesses elected 2 bailiffs and 12 burgesses annually and did service at their own courts every three weeks, the court leet being held twice a year. In resisting an attack made by the bishop in 1600 on their right of toll, the burgesses could only claim Farnham as a borough by prescription as their charters had been mislaid, but the charters were subsequently found, and after some litigation their rights were established. In the 18th century the corporation, a close body, declined, its duties being performed by the vestry, and in 1789 the one survivor resigned and handed over the town papers to the bishop, who Farnham sent representatives to parliament in the 13th to the 15th, on both occasions being practically the bishop's pocket borough. In accordance with the grant of 1247 a fair was held on All Saints' day and also on Holy Thursday; the former was afterwards held on All Souls' Day. Farnham was early a market of importance, and in 1216 a royal grant changed the market day from Sunday to Thursday in each week. It was famous in the early 17th century for wheat and oats; hop-growing began in 1597.

FARNWORTH, an urban district in the Radcliffe-cum-Farnworth parliamentary division of Lancashire, England, on the line of the Manchester and Bolton junction railway. Pop. (1901) 25,025. Cotton mills, iron foundries, brick and tile works, and collieries employ the large industrial population.

PARO, the capital of a district bearing the same name, in southern Portugal; at the terminus of the Lisbon-Faro railway, and on the Atlantic Ocean. Pop. (1900) 11,789. Faro is an episcopal see, with a Renaissance cathedral of great size, an ecclesiastical seminary, and a ruined castle surrounded by Moorish fortifications. Its broad but shallow harbour is protected on the south by the long island of Caes, and a number of sandy islets, which, being constantly enlarged by silt from the small river Fermoos, render the entrance of large vessels impossible. Fishing is an important industry, and fish, with wine, fruit, cork, baskets and sumach, are the principal articles of export. Little has been done to develop the mineral resources of the district, which include tin, lead, antimony and auriferous quartz. Faro was taken from the Moors by Alphonso III. of Portugal (1248-1279). It was sacked by the English in 1506, and nearly destroyed by an earthquake in 1755.

The administrative district of Faro coincides with the ancient kingdom and province of Algarve (q.v.; pop. (1900) 255,151; area, 1937 sq. m.

FARO (from Pharaoh, a picture of the Egyptian king appearing on a card of the old French pack), a game of cards, played with a full pack. Originally the pack was held in the dealer's left hand, but nowadays very elaborate and expensive implements are used. The dealer places the pack, after shuffling and cutting, in a dealing-box face upwards, and the cards are taken from the top of the box in couples through a slit in the side. The exposed card on top is called soda, and the last card left in the box is in hoc. The implements include counters of various colours and values, a dealing-box, a case or frame manipulated by a "case-keeper," upon which the cards already played are arranged in sight, a shuffling-board, and score-sheets for the players. Upon the table is the "lay-out," a complete suit of spades enamelled on green cloth, upon or near which to place the stakes. The dealer takes two cards from the box, placing the first one near it and the second close beside it. Each deal of two cards is called a turn, and there are twenty-five such, soda and hoc not counting. The players stake upon any card they please, or in such manner as to take in several cards, reducing the amount, but increasing the chances, of winning, as at roulette. The dealer, having waved the hand, after which no more bets may be made, deals the turn, and then proceeds to gather in the stakes won by him, and to pay those he has lost. The chances as between dealer and punters, or players, are equal, except that the banker wins half the money staked on the cards of a turn should they chance to be alike. Faro is played considerably in parts of the United States, whither it is said to have been taken from France, where it had a great vogue during the reign of Louis XIV. Owing to the dishonest methods of many gambling "clubs" the game is in disrepute.

FARQUHAR, GEORGE (1677-1707), British dramatist, son of William Farquhar, a clergyman, was born in Londonerry, Ireland, in 1677. When he was seventeen he was entered as a sizar at Trinity College, Dublin, under the patronage of Dr Wiseman, bishop of Dromore. He did not long continue his studies, being, according to one account, expelled for a profane joke. Thomas Wilkes, however, states that the abrupt termination of his studies was due to the death of his patron. He became an actor in the Dublin stage, but in a fencing scene in Dryden's Indian Emperor he forgot to exchange his sword for a club results which narrowly escaped being fatal to a fellow-actor. After this accident he never appeared on the boards. He had met Robert Wilks, the famous comedian, in Dublin. Though he did not, as generally stated, go to London with Wilks, it was at his suggestion that he wrote his first play, Love and a Bottle, which was performed at Drury Lane, perhaps through Wilks' interest, in 1698. He received from the earl of Orrery a lieutenantcy in his regiment, then in Ireland, but in two letters of his dated from Holland in 1700 he says nothing of military service. He wrote The Constant Couple: or a Trip to the Jubilee (1699), ridiculing the preparations for the pilgrimage to Rome in the Jubilee year, met with an enthusiastic reception. Wilks as Sir Harry Wildair contributed substantially to its success. In 1701 Farquhar wrote a sequel, Sir Harry Wildair. Leigh Hunt says that Mrs Oldfield, like Wilks, played admirably well in it, but the original Lady Lurewell was Mrs Verbruggen. Mrs Oldfield is said to have been the "Penelope" of Farquhar's letters. In 1702 Farquhar published a slight volume of miscellanies—Love and Business; in a Collection of Occasional Verse and Epistolary Prose—containing, among other things, "A Discourse on Comedy in reference to the English Stage," in which he defends the English neglect of the dramatic unities. "The rules of English comedy," he says, "don't lie in the compass of Aristotle or his followers, but in the pit, box and galleries." In 1702 he borrowed from Fletcher's Wild Goose Chase, The Inconstant, or the Way to win Him, in which he followed his original fairly closely except in the last act. In 1703 he married, in the expectation of a fortune, but found too late that he was deceived. It is said that he never reproached his wife, although the marriage increased his liabilities and the rest of his life was a constant struggle against poverty. His other plays are: The Stage Coach (1704), a one-act large adapted from the German; The Duke's Daughter, published in a Chapelle in conjunction with Peter Motteux; The Twin Rivals (Drury Lane, 1707); The Recruiting Officer (Drury Lane, 1706); and The Beaux' Stratagem (Haymarket, 1707). The Recruiting Officer was suggested to him by a recruiting expedition (1705) in Shropshire, and is dedicated to his "friends round the Wrekin." The Beaux' Stratagem is the best of all his plays, and long kept the stage. Genest notes nineteen up to 1828. Two embattled gentlemen travel in the country disguised as master and servant in the hope of rendering their fortune. The play gives vivid pictures of the Lichfield inn with its rascally landlord, and of the domestic affairs of the Suisses, Archer, the supposed valet, whose adventurous spirit secures full play, was one of Garrick's best parts.

Meanwhile one of his patrons, said to have been the duke of Ormond, had advised Farquhar to sell out of his regiment, and had promised to give him a captaincy in his own. Farquhar sold his commission, but the duke's promise remained unfulfilled. Before he had finished the second act of The Beaux' Stratagem he knew that he was stricken with a mortal illness, but it was necessary to persevere and to be "consumedly lively to the end." He had received in advance £30 for the copyright from Lintot the bookseller. The play was staged on the 5th of March, and Farquhar lived to have his third night, and there was an extra benefit on the 29th of April, the day of his death. He left his two children to the care of his friend Wilks. Wilks obtained a benefit at the theatre for the dramatist's widow, but he seems to have done little for the children. They were apprenticed to a mantua-maker, and one of them was, as late as 1784, in
receipt of a pension of $50 solicited for her by Edmund Chaloner, a patron of Farquhar. She was then described as a maid servant and possessed of sentiments “fitted to her humble situation.”

The plots of Farquhar's comedies are ingenious in conception and skilfully conducted. He has no pretensions to the brilliance of Congreve, but his amusing dialogue arises naturally out of the situation, and its wit is never strained. Sergeant Kite in the Recruiting Officer, Scrub, Archer and Boniface in The Beaux' Stratagem are distinct, original characters which had a great success on the boards, and the unexpected incidents and adventures in which they are mixed up are represented in an irresistibly comic manner by a man who thoroughly understood the resources of the theatre. The plots are complicated with whirling adventures and the adventurous heroes are drawn with such a skilful and clever type he was describing himself. His own disposition seems to have been most lovable, and he was apparently a much gayer person than the reader might be led to suppose from the “Portrait of Himself” quoted by Leigh Hunt. The code of morals followed by these characters is open to criticism, but they are human and genial in their ruggery, and compare far from unfavourably with the cynical creations of contemporary drama. The advance which he made on his immediate predecessors in dramatic construction and in general moral tone is more striking when it is remembered that he died before he was thirty.

Farquhar's dramatic works were published in 1728, 1742 and 1747, and by Thomas Wilkinson with a biography in 1775. They were included in the Dramatic Works of Wycherley, Congreve, Vanbrugh and Farquhar (1849), with biographical and critical notices, by Leigh Hunt. See also The Dramatic Works of George Farquhar, with Life and Letters, by A.C. Ewald (3 vols, 1863); The Best Plays of George Farquhar (Mermaid series, 1906), with biographical and critical introductions, by William Archer; The Beaux' Stratagem, edited (1898) by H. Macaulay FitzGibbon for "The Temple Dramatists"; and D. Seward, "George Farquhar, sein Leben und seine Original-Dramen" (1904) in Wiener Beitrage zur engl. Philol.

FARR, WILLIAM (1807-1839), English statistician, was born at Kenley, in Shropshire, on the 30th of November 1807. When nineteen he became the pupil of a doctor in Shrewsbury, also acting as dresser in the infirmary there. He then went to Paris to study medicine, but after two years returned to London, where, in 1832, he qualified as L.S.A. Next year he began to practise, but without very brilliant results, for five years later he definitely abandoned the exercise of his profession on accepting the post of compiler of abstracts in the registrar-general's office. The commissioners for the 1841 census consulted him on several points, but did not in every case follow his advice. For the next two decennial censuses he acted as assistant-commissioner; for the last three he was a commissioner, and he was the author of much of the registrar-general's report and the basis of the returns. He had an ambition to become registrar-general; and when that post became vacant in 1870, he was so disappointed at the selection of Sir Brydges Heneker instead of himself, that he refused to stay any longer in the registrar's office. He died of paralysis of the brain a year or two later, on the 14th of April 1883. A great part of Farr's literary production is to be found in the papers which, from 1839 to 1860, he wrote for each annual report of the registrar-general on the cause of the year's deaths in England. He was also the author of many papers on general statistics and on life-tables for insurance, some read before the Royal Statistical Society, of which he was president in 1871 and 1872, some contributed to the Lancet and other periodicals. A selection from his statistical writings was published in 1885 under the editorship of Mr Noel Humphreys.
Farrant seriously planned operations against Mobile, a port to which the fall of New Orleans had given increased importance. Even then he was long delayed by the want of monitors with which to oppose the ironclad vessels of the enemy. It was the end of July 1864 before he was joined by these monitors; and on the 5th of August, undismayed by the loss of his leading ship, the monitor "Tecumseh," sunk by a torpedo, he forced the passage into the bay, destroyed or captured the enemy's ships, including the ram "Tennessee" bearing Admiral Buchanan's flag, and took possession of the forts. The town was not occupied till the following April, but with the loss of its harbour it ceased to have any political or strategical importance.

With this Farrant's active service came to an end; for though in September 1864 he was offered the command of the force intended for the reduction of Wilmington, the state of his health, after the labours and anxieties of the past three years, in a trying climate, compelled him to decline it and to ask to be recalled. He accordingly returned to New York in December, and was received with the wildest display of popular enthusiasm. It was then that the Government instituted the rank of vice-admiral, previously unknown in the American service. Farrant was promoted to it; on the 5th of March 1865 he was furthered to the rank of admiral. In 1867, with his flag flying in the "Franklin," he visited Europe. The appointment was an honourable distinction without political or naval import: the "Franklin" was, to all intents, for the time being, a yacht at Farrant's disposal; and her arrival in the different ports was the signal for international courtesies, entertainments and social gaiety. She returned to America in 1868, and Farrant retired into private life. Two years later, on the 14th of August 1870, he died at Portsmouth, New Hampshire.

Farrant was twice married, and left, by his second wife, a son, Loyall Farrant, who, in 1878, published a Life of his father "embodifying his Journal and Letters." Another Life (1892), by Captain A. T. Mahan, though shorter, has a greater value from the professional point of view, by reason of the critical appraisement of Farrant's services.

Farrant, Richard, composer of English church music, flourished during the 17th century. Very little is known about him. Fétes gives 1630 as the date of his birth, but on what authority does not appear. He became a gentleman of the Chapel Royal in the reign of Edward VI., but resigned his post in 1564 on being appointed master of the children of St George's chapel. In this capacity he presented a play before the queen at Shrovetide 1568, and again at Christmas of the same year, receiving on each occasion the sum of £6: 13: 4d. In November 1569 he was reinstated as gentleman of the Chapel Royal. It is stated by Hawkins (History of Music, vol. iii. 279) that Farrant was also one of the clerks and organists of St George's chapel, Windsor, and that he retained these posts till his death. Many of his compositions are printed in the collections of Barnard and Boyce. Among the most admired of them are a service in G minor, and the anthems "Call to remembrance" and "Hide not thou thy face." It is doubtful whether Farrant is entitled to the credit of the authorship of the beautiful anthem "Lord, for thy tender mercies' sake." No copy of the music under his name appeared in print till 1800, although it had been earlier attributed to him. Some writers have named John Hilton, and others Thomas Tallis, as the composer. From entries in the Old Check Book of the Chapel Royal (edited for the Camden Society by Dr Rimbaud) it appears that Farrant died, not in 1583, as Hawkins states, but on the 30th of November 1580 or 1581.

Frederic William (1831-1903), English divine, was born on the 7th of August 1831, in the Fort of Bombay, where his father, afterwards vicar of Sidcup, Kent, was then a missionary. His early education was received in King William's College, Castletown, Isle of Man, a school whose external surroundings are reproduced in his popular schoolboy tale, Eric; or, Little by Little. In 1847 he entered King's College, London. Through the influence of F.D. Maurice he was led to the study of Coleridge, whose writings had a profound influence upon his faith and opinions. He proceeded to Trinity College, Cambridge, in October 1851, and in the following year took the degree of B.A. at the university of London. In 1854 he took his degree as fourth junior optime, and fourth in the first class of the classical tripos. In addition to other college prizes he gained the chancellor's medal for the English prize poem on the search for Sir John Franklin in 1852, the Le Bas prize and the Norrisian prize. He was elected fellow of Trinity College in 1856.

On leaving the university Farrar became an assistant-master under G. E. L. Cotton at Marlborough College. In November 1855 he was appointed an assistant-master at Harrow, where he remained for fifteen years. He was elected a fellow of the Royal Society in 1864, university preacher in 1868, honorary chaplain to the queen in 1869 and Hulsean lecturer in 1870. In 1871 he was appointed headmaster of Marlborough College, and in the following year he became chaplain-in-ordinary to the queen. In 1876 he was appointed canon of Westminster and rector of St Margaret's, Westminster. He took his D.D. degree in 1874, the first under the new regulations at Cambridge. Farrar began his literary labours with the publication of his schoolboy story Eric in 1856, succeeded in the following year by Julian Home and Lyrics of Life, and in 1862 by St Winifred's; or the World of the Warden. He proceeded to a work on The Origin of Language, and followed it up by a series of works on grammar and scholastic philology, including Chapters on Language (1865); Greek Grammar Rules (1865); Greek Syntax (1866); and Families of Speech (1866). He edited Essays on a Liberal Education in 1868; and published Seekers after God in the Sunday Library (1860). It was by his theological works, however, that Farrar attained his greatest popularity. His Hulsean lectures were published in 1870 under the title of The Witness of History to Christ. The Life of Christ, which was published in 1879, speedily passed through a great number of editions, and is still in much demand. It reveals considerable powers of imagination and eloquence, and was partly inspired by a personal knowledge of the sacred localities depicted. In 1877 appeared In the Days of My Youth, sermons preached in the chapel of Marlborough College; and during the same year his volume of sermons on Eternal Hope—in which he called in question the dogma of everlasting punishment—caused much controversy in religious circles and did much to muffle the harsh theology of an earlier age. There is little doubt that his boldness and liberality of thought barred his elevation to the episcopate. As an old friend of Mrs Parnell he was one of the Warden of St Stephen's, which succeeded in 1882 by The Early Days of Christianity. Then came in order of publication the following works: Everyday Christian Life; or, Sermons by the Way (1887); Lives of the Fathers (1888); Sketches of Church History (1889); Darkness and Dawn, a story of the Neronic persecution (1891); The Voice from Sinai (1892); The Life of Christ as Represented in Art (1894); a work on Daniel (1895); Gathering Clouds, a tale of the days of Chrysostom (1896); and The Bible, its Meaning and Supremacy (1896). Farrar was a copious contributor of articles to various magazines, encyclopaedias and theological commentaries. In 1881 he was made archdeacon of Westminster and rural dean; in 1885 he was appointed Hampton lecturer at Oxford, and took for his subject "The History of Interpretation." He was appointed dean of Canterbury in 1895. From 1890 to 1895 he was chaplain to the speaker of the House of Commons, and in 1894 he was appointed deputy-clerk of the closet to Queen Victoria. He died at Canterbury on the 22nd of March 1903.

As a theologian Farrar occupied a position midway between the Evangelical party and the Broad Church; while as a somewhat rhetorical preacher and writer he exerted a commanding influence over wide circles of readers. He was an ardent temperance and social reformer, and was one of the founders of the institution known as the Anglican Brotherhood, a religious band with modern aims and objects.

See his Life, by his son R. Farrar (1904).
and she became the natural successor to Mrs Abington when the latter left Drury Lane in 1782. The parts of Hermione, Olivia, Portia and Juliet were in her repertory, but her Lady Betty Modish, Lady Townly, Lady Fanciful, Lady Teazle and similar parts were her favourites. In 1797 she married Edward, 12th earl of Derby (1752–1834).

**FARRAR, WILLIAM** (1786–1861), English actor, was born on the 13th of May 1786, the son of an actor (b. 1725) of the same name, who played leading rôles from 1784 to 1795 at Covent Garden. His first appearance on the stage was at Plymouth at the Theatre Royal, then under the management of his brother, in Inigo Jones’ *Oldcastle*. His first London appearance was in 1818 at Covent Garden as Sir Peter Teazle, a part with which his name is always associated. He played at Covent Garden every winter until 1828, and began in 1824 a series of summer engagements at the Haymarket which also lasted some years. At these two theatres he played an immense variety of comedy characters. From 1828 until 1837 he was at Drury Lane, where he essayed a wider range, including Polonius and Caesar. He was again at Covent Garden for a few years, and next joined Benjamin Webster at the Haymarket, as stage-manager as well as actor. In 1835 at the close of his performance of the title-part in *Mark Antony*, *Old Part*, and *A Winter’s Night* at the Haymarket. He was, however, able to reappear the following year, and he remained at the Haymarket ten years more, though his acting never again reached its former level. For a time he managed the Strand, and, 1830–1853, was lessee of the Olympic. During his later years he confined himself to old men parts, in which he was unrivalled. In 1855 he made his final appearance at the Haymarket, as Lord Ogleby in a scene from *The Clandestine Marriage*. He died in London on the 24th of September 1861. In 1825 he had married the actress Mrs Faucit, mother of Miss Helena Saville Faucit (Lady Martin), and he left two sons, Henry (1826–1890) and William (1825–1908), both actors. The former was the father of Ellen [Nellie] Farren (1848–1904), long famous for boy’s parts in Gaiety musical burlesques, in the days of Edward Terry and Fred Leslie. As Jack Sheppard, and in similar rôles, she had a unique position at the Gaiety, and was an unrivalled public favourite. From 1862 her health failed, and her retirement, coupled with Fred Leslie’s death, brought to an end the type of Gaiety burlesque associated with them.

**FARRER, THOMAS HENRY FARRER, 1ST BARON (1819–1899)**, English civil servant and statistician, was the son of Thomas Farrer, a solicitor in Lincoln’s Inn Fields. Born on the 24th of June 1819, he was educated at Eton and Balliol College, Oxford, where he graduated in 1840. He was called to the bar at Lincoln’s Inn in 1844, but retired from practice in the course of a few years. He entered the public service in 1850 as secretary to the naval (renamed in 1853 the marine) department of the Board of Trade. In 1865 he was promoted to be one of the joint secretaries of the Board of Trade, and in 1867 became permanent secretary. His tenure of this office, which he held for upwards of twenty years, was marked by many reforms and an energetic administration. Not only was he an able Liberal in politics, but an uncompromising Free-trader of the strictest school. He was created a baronet for his services at the Board of Trade in 1883, and in 1886 he retired from office. During the same year he published a work entitled *Free Trade versus Fair Trade*, in which he dealt with an economic controversy then greatly agitating the public mind. He had already, in 1883, written a volume on *The State in its Relation to Trade*. In 1859 he was co-opted by the Progressives an alderman of the London County Council, of which he became vice-chairman in 1890. His efficiency and ability in this capacity were warmly recognized; but in the course of time divergences arose between his personal views and those of many of his colleagues. The tendency towards socialism which became apparent was quite at variance with his principles of individual enterprise and responsibility. He consequently resigned his position. In 1893 he was raised to the peerage. From this time forward he devoted much of his energy and leisure to advocating his views at the Cobden Club, the Political Economy Club, on the platform, and in the public press. Especially were his efforts directed against the opinions of the Free Trade League, and upon this and other controversies on economic questions he wrote able, clear, and uncompromising letters, which left no doubt that he still adhered to the doctrines of free trade as advocated by its earliest exponents. In 1898 he published his *Studies in Currency*. He died at Abinger Hall, Dorking, on the 11th of October 1899. He was succeeded in the title by his eldest son Thomas Cecil (b. 1859).

**FARRIER, and FARRIERY** (from Lat. *ferrarius*, a blacksmith, *ferrum*, iron). Farrier is the name given generally either to a man who is a practitioner of the veterinary art, or to a practitioner of the veterinary art; and farriery is the term for his business. Primarily the art of farriery is identical with that of the blacksmith, in so far as he makes and faxes shoes on horses (see Horse-shoes); he is liable in law for negligence, as one who holds himself out as skilled; and he has a lien on the animal for his expenses. William the Conqueror is supposed to have introduced horse-shoeing into England, and the art had an important place through the middle ages, the days of chivalry, and the later developments of equitation. In modern times it has been closely allied with the general progress in veterinary science. The farrier’s knowledge is an intimate knowledge of the horse’s foot and hoof.

**FARS** (the name *Faristan* is not used), one of the five *mamlukats* (great provinces) of Persia, extending along the northern shore of the Persian Gulf and bounded on the west by Arabian, on the north by Isfahan and on the east by Kerman. It lies between 45° 30’ and 50° 10’ E. and 26° 30’ and 31° 45’ N. and has an area of nearly 60,000 sq. m. Fars is the same word as the Greek *Persis*, and, originally the name of only a part of the Persian empire (Iran), has become the name which Europeans have applied to the whole (see PERSIS). The province is popularly, but not for administrative purposes, divided according to climate into *germsir* and *sardisir*, or the warm and cold regions. The former extends from the sea to the central chain of hills and contains all the lowlands and many mountainous districts, some of the latter rising to an elevation of between 3000 and 4000 ft. and the *sardisir* comprises the remaining and northern districts of the province.

In Arrian’s relation of the voyage of Nacharac (*Indica*, 40), these two regions are well described. “The first part of Persis which lies along the Persian Gulf is hot, sandy and barren and only the date palm thrives there. The other part comprehends inner Persis lying northwards; it enjoys a pleasant climate and has fertile and well-watered plains, gardens with trees of all kinds, rich pasturages and forests abounding with game; with the exception of the olive all fruits are produced in profusion, particularly the vine. Horses and other draught animals are reared in the province, and there are several lakes frequented by water-fowl, and streams of clear water flow through it, as for instance the Kyros (Kur) formed by the junction of the Medes and Araxes.”

The mountains of Fars may be considered as a continuation of the Zagros and run parallel to the shores of the Persian Gulf. They comprise several ranges which the roads from the sea to the interior have to cross at right angles, thereby rendering communication and transport very difficult. The highest of the mountains of Fars (14,000 ft.) is the Kuh Dinâ in the north-western part of the province. Of the rivers of Fars only three important ones flow into the sea: (1) the Mand (Arrian’s Sitakos), which ends in the Caspian; (2) the Shapur or Khishan river (Granite); (3) the Tab (Oratissâ). Some rivers, notably the Kur (Kyros, Araxes) which flows into the Bakhtegan lake east of Shiraz, drain into inland depressions or lakes.

The capital of the province is Shiraz, and the subdivision in districts, the chief places of the districts and their estimated population, and the number of inhabited villages in each as they appear in lists dated 1884 and 1905 are shown on the following page.

The above sixty districts are grouped into eighteen sub-provinces under governors appointed by the governor-general of Fars, but the towns of Bushire, Lingah and Bander Abbasi, together with the villages in their immediate neighbourhood, form a separate government known as that of the "Persian Gulf Ports" (Benādīr i Khaljī i Fars), under a governor appointed from Teheran. The population of the province has been estimated at 750,000 and the yearly revenue it pays to the state amounts to about £150,000. Many districts are fertile, but some, particularly those in the south-eastern part of the province, do not produce sufficient grain for the requirements of the sparse population. In consequence of droughts, ravages of locusts and misgovernment by local governors the province has been much impoverished and hundreds of villages are in ruins and deserted. About a third of the population is composed of turbulent and lawless nomads who, when on the march between their winter and summer camping grounds, frequently render the roads insecure and occasionally plunder whole districts, leaving the inhabitants without means of subsistence.

The province produces much wheat, barley, rice, millet, cotton, but the authorities every now and then prohibiting the export of cereals, the people generally sow just as much as they think will suffice for their own wants. Much tobacco of excellent quality, principally for consumption in Persia, is also grown (especially in Fessa, Darab and Jahrom) and a considerable quantity of opium, much of it for export to China, is produced. Salt, lime and gypsum are abundant. There are also some oil

* Persian census in 1884: 25,284 males, 28,323 females.
wells at Daliki, near Bushire, but several attempts to tap the oil have been unsuccessful. There are no valuable oyster-banks in Persian waters, and all the Persian Gulf pearls are obtained from banks on the coast of Arabia and near Bahrain.

**FARTHING** (A.S. *fórtth*, fourth, *fización*), the smallest English coin, equal to the fourth of a penny. It became a regular part of the coinage from the reign of Edward I., and was, up to the reign of Mary, a silver coin. No farthing was struck in the reign of Elizabeth, but a silver three-farthing piece was issued in that reign, with a profile bust of the queen crowned, with a rose behind her head, and inscribed "E.D.G. Rosa sine spina." The copper farthing was first introduced in the reign of James I., a patent being given to Lord Harlington of Exton in 1616 for issue of copper tokens of this denomination. It was nominally of six grains' weight, but was usually heavier. Properly, however, the copper farthing dates from the reign of Charles II., in whose reign also was issued a tin farthing, with a small copper plug in the centre, and an inscription on the edge, "Nummorum famulus 1684." No farthings were actually issued in the reign of Queen Anne, though a number of patterns were prepared (see NUMISMATICS: medieval section, England). In 1800 the copper farthing was superseded by one struck in bronze. In 1812 a proclamation was issued giving currency to half-farthings, and there were several issues, but they were demagnetized in 1860. In 1867 the practice was adopted of darkening farthings before issue, to prevent their being mistaken for half-sovereigns.

**FARTHINGALE** (from the O. Fr. *verdagoalle*, or *vertagarle*, a corruption of the Spanish name of the article, *verdagoado*, from *verdago*, a rod or stick), a case or hoop, originally of bent rods, but afterwards made of whalebone, upon which were hung the voluminous skirts of a woman's dress. The fashion was introduced into England from Spain in the 16th century. In its most exaggerated shape, at the beginning of the 17th century, the top of the farthingale formed a flat circular surface projecting above the wearer's foot (see Lace, History of Lace).

**FARUKHABAD**, FARRAKHABAD, or FURUückhbad, a city and district of British India in the Agra division of the United Provinces. The city is near the right bank of the Ganges, 87 m. by rail from Cawnpore. It forms a joint municipality with Fatehgah, the civil headquarters of the district with a military cantonment. Pop. (1901) 67,338. At Fatehgah is the government gun-carriage factory; and other industries include cotton-printing and the manufacture of gold lace, metal vessels and tents.

The **District of Farukhabad** has an area of 1685 sq. m. It is a flat alluvial plain in the middle Doab. The principal rivers are: the Ganges, which has a course of 85 m., either bordering on or passing through the district, but is not at all times navigable by large boats throughout its entire course; the Kali-nadi (84 m.) and the Isan-nadi (42 m.), both tributaries of the Ganges; and the Ariad-nadi, which, after a course of 20 m. in the south of the district, passes into Cawnpore. The principal products are rice, wheat, barley, millets, pulses, cotton, sugar-cane, potatoes, &c. The grain crops, however, are insufficient for local wants, and grain is largely imported from Oudh and Rohilkhand. The district is, therefore, liable to famine, and it was severely visited by that calamity six times during the 19th century—in 1803—1804, 1815—1816, 1825—1826, 1833—1818, 1865—1866 and 1889—1900. Farukhabad is one of the healthiest districts in the Doab, but fevers are prevalent during August and September. The average annual mean temperature is almost 80° F.; the average annual rainfall, 29-4 in.

In the early part of the 18th century, when the Mogul empire was breaking up, Mahammed Khan, a Bangash Afghan from a village near Kaimganj, governor of Allahabad and later of Malwa, established a considerable state of which the present district of Farukhabad was the nucleus, founding the city of Farukhabad in 1714. After his death in 1743, his son and successor Kaim Khan was embroiled by Safdar Jang, the nawab wazir of Oudh, with the Rohillahs, in battle with whom he lost his life in 1749. In 1750 his brother, Ahmad Khan, recovered the Farukhabad territories; but Safdar Jang called in the Mahrattas, and a struggle for the possession of the country began, which ended in 1771, on the death of Ahmad Khan, by his becoming tributary to Oudh. In 1801 the nawab wazir ceded to the British his lands in this district, with the tribute due from the nawab of Farukhabad, who gave up his sovereign rights in 1802. In 1804 the Mahrattas, under Holkar, ravaged this tract, but were utterly routed by Lord Lake at the town of Farukhabad. During the mutiny Farukhabad shared the fate of other districts, and passed entirely out of British hands for a time. The natives, who had for some time previously evinced a sedition spirit, finally broke into rebellion on the 18th of June 1857, and placed the titular nawab of Farukhabad on the throne. The English military residents took shelter in the fort, which was relieved by the British troops, and the fort being undermined, they endeavoured to escape by the river. One unfortunate man in reaching Cawnpore, but only to fall into the hands of Nana. Its occupants were made prisoners, and perished in the massacre of the roth of July. The other boat was stopped on its progress down the river, and all those in it were captured or killed, except four who escaped. The prisoners were conveyed back to Fatehgah, and murdered there by the nawab on the roth of July. The rebels were defeated in several engagements, and on the 3rd of January 1858 the English troops recaptured Fatehgah fort; but it was not till May that order was thoroughly re-established. In 1900 the population was 925,812, showing an increase of 8% in one decade. Part of the district is watered by distributaries of the Ganges canal; it is traversed throughout its length by the Aga-Cawnpore line of the Rajputana railway, and is also served by a branch of the East Indian system. Tobacco, opium, potatoes and fruit, cotton-prints, scent and saltpetre are among the principal exports.

**FASCIe**, in Roman antiquities, bundles of elm or birch rods from which the head of an axe projected, fastened together by a red strap. Nothing is known of their origin, the tradition that represents them as borrowed by one of the kings from Ettruria resting on insufficient groups. As the emblem of official authority, they were carried by the licitors, in the left hand and on the left shoulder, before the higher Roman magistrates; at the funeral of a deceased magistrate they were carried behind the bier. The licitors and the fasces were so inseparably connected that they came to be used as synonymous terms. The fasces originally represented the power over life and limb possessed by the kings, and after the abolition of the monarchy, the consuls, like the kings, were preceded by twelve fasces. Within the precincts of the city the axe was removed, in recognition of the right of appeal (procatio) to the people in a matter of life and death; outside Rome, however, each consul retained the axe, and was preceded by his own licitors, not merely by a simple accessus (supernumerary), as was originally the case within the city when he was not officiating. Later, the licitors preceded the officiating consul, and walked behind the other. Valerius Publicola, the champion of popular rights, further established the custom that the fasces should be lowered before the people, as the real representatives of sovereignty (Livy ii. 7; Florus i. 9; Plutarch, *Publicola*, 10); lowering the fasces was also the manner in which an inferior saluted a superior magistrate. A tradition was thus attached to the fasces, that of the emblems, having official shape; (including the axe even within the city); most of the other magistrates had fasces varying in number, with the exception of the censors, who, as possessing no executive authority, had none. Fasces were given to the Flamens Diaulis and (after 42 B.C.) even to the Vestals. During the times of the republic, a victorious general, who had been saluted by the title of imperator by his soldiers, had his fasces crowned with laurel (Cicero, *Pro Ligario*, 3). Later, under the empire, when the emperor received the title for life on his accession, it became restricted to him, and the laurel was regarded as distinctive of the imperial fasces (see Mommsen, *Romischer Staatsrecht*, i. (1897, p. 373).

**FASCIA** (Latin for a hand-gage or fillet), a term used for many objects which resemble a band in shape; thus in anatomy it is applied to the layers of fibrous connective tissue which sheathe
the muscles or cover various parts or organs in the body, and in zoology, and particularly in ornithology, to bands or stripes of colour. In architecture the word is used of the bands into which the architrave of the Ionic and Corinthian orders is subdivided; their origin would seem to have been derived from the superimposition of two or more beams of timber to span the opening between columns and to support a superincumbent weight; the upper beam projected slightly in front of the lower, and similar projections were continued in the stone or marble beam though in one block. In the Roman Corinthian order the fasciae, still projecting in front of the other, were subdivided by several mouldings, sometimes carved. The several bands are known as the first or upper fascia, the second or middle fascia and the third or lower fascia. The term is sometimes applied to flat projecting bands in Renaissance architecture when employed as string courses. It is also used, though more commonly in the form "faca," of the band or plate over a shop-front, on which the name and occupation of the tradesman is written.

FASCINATION (from Lat. fascinare, to bewitch, probably connected with the Gr. βασίλευειν, to speak ill of, to bewitch), the art of enchanting or bewitching, especially through the influence of the "evil eye," and so probably of the "evil influence over the reason or will. The word is thus used of the supposed paralysing attraction exercised by some reptiles on their victims. It is also applied to a particular hypnotic condition, marked by muscular contraction, but with consciousness and power of remembrance left. In a quite general sense, fascination means the exercise of any charm or strong attraction.

FASCINE (from the Lat. fascina, fascetis, a bundle of sticks), a large faggot of brushwood used in the revetments of earthworks and for other purposes of military engineering. The British service pattern of fascine is 18 ft. long; it is tied as tightly as possible at short intervals, and the usual diameter is 6 in. Similar bundles of wood formed part of the foundations of the early lake-dwellings, and in modern engineering fascines are used in making rough roads over marshy ground and in building river and sea walls and breakwaters.

FASHION (adapted from Fr. façon, Lat. factio, making, jacere, to do or make), the action of making, hence the shape or form which anything takes in the process of making. It is thus used in the sense of the pattern, kind, sort, manner or mode in which a thing is done. It is particularly used of the common or customary way in which a thing is done, and so is applied to the manner or custom prevalent at or characteristic of a particular period, especially of the manner of dress, &c., current at a particular period in any rank of society, for which the French term is modes (see Costume).

FASHODA (renamed, 1904, KOODO), a post on the west bank of the Upper Nile, Anglo-Egyptian Sudan, in 9° 53' N., 32° 8' E., 459 m. S., by river, of Khartoum. It is the headquarters of the mudiria (province) of the Upper Nile. The station is built on a flat peninsula connected by a narrow strip of land with a ridge which runs parallel with the river. The surrounding country is mostly a deep swamp and the station is most unhealthy; mosquitos are present in millions. The climate is always damp and the temperature rarely below 98° in the shade. The government offices are well-built brick structures. In front of the station is a long low island, and when the Nile is at its lowest this channel becomes dry. Several roads from Kordofan converge on the Nile at this point, and near the station is the residence of the mek, or king, of the Shilluk tribe, whose designation of the post was adopted when it was decided to abandon the use of Fashoda. At Lul, 18 m. farther up stream, is an Austrian Roman Catholic mission station.

An Egyptian military post was established at Fashoda in 1865. It was then a trading station of some importance, slaves being the chief commodity dealt in. In 1883-1884 the place fell into the hands of the Mahdists. On the 10th of July 1885 it was occupied by a French force from the Congo under Commandant J. B. Marchand, a circumstance which gave rise to a state of great tension between Great Britain and France. On the 11th of December following the French force withdrew, returning home via Abyssinia (see Africa, § 5, and Egypt, History, and Military Operations).

FAST AND LOOSE, a cheating game played at fairs by sharpeners. A strap, usually in the form of a belt, is rolled or doubled up with a loop in the centre, and laid edgewise on a table. The swindler then bets that the loop cannot be caught with a stick or skewer as he unrolls the belt. As this looks to be easy to do the bet is often taken, but the sharer unrolls the belt in such a manner as to make the catching of the loop practically impossible. Centuries ago it was much practised by girls, a circumstance alluded to by Shakespeare in Anthony and Cleopatra (iv. 12):

"Like a right gipsy, hath, at fast and loose,
Beguiled me to the very heart of loss."

From this game is taken the colloquial expression "to play fast and loose." At the present day it is called "prick the garter" or "prick the loop."

Fasti, in Roman antiquities, plural of the Latin adjective fastus, but more commonly used as a substantive, derived from fas, meaning what is binding, or allowable, by divine law, as opposed to fas, or human law. Fasti dies thus came to mean the days on which law business might be transacted without impity, corresponding to our own "lawful days." The opposite of the dies fasti were the dies nefasti, on which, on various religious grounds, the courts could not sit. The word fasti itself then came to be used to denote lists or registers of various kinds, which may be divided into two great classes.

1. Fasti Diurni, divided into urbani and rustici, a kind of official year-book, with dates and directions for religious ceremonies, court-days, market-days, divisions of the month, and the like. Until 304 n.c. the lcore of the calendar remained the exclusive and lucrative monopoly of the priesthood; but in that year Gnaeus Flavius, a pontifical secretary, introduced the custom of publishing in the forum tables containing the requisite information, besides brief references to victories, triumphs, prodigies, &c. This list was the origin of the public Roman calendar, in which the days were divided into weeks of eight days each, and indicated by the letters A-H. Each day was marked by a certain letter to show its nature; thus the letters F., N., N.P., F.P., Q. Rex C.F., C. EN., stood for fastus, nefastus, nefastus, in some unexplained sense, fastus priore, quando rex (sacrorum comitiius) fastus, comitialis and inercius. The dies inercici were partly fasti and partly nefasti. Ovid's Fasti is a partial description of the Roman festivals of the six months, written to illustrate the Fasti published by Julius Caesar after he remodelled the Roman year. Upon the cultivators fewer feasts, sacrifices, ceremonies and holidays were enjoined than on the inhabitants of cities; and the rustic fasti contained little more than the ceremonies of the calends, nones and ides, the fairs, signs of zodiac, increase and decrease of the days, the tutelary gods of each month, and certain directions for rustic labours to be performed each month.

2. Fasti Magistrates, Annales or Historici, were concerned with the several feasts, and everything relating to the gods, religion and the magistrates; to the emperors, their birthdays, offices, days consecrated to them, with feasts and ceremonies established in their honour or for their prosperity. They came to be denominated magi, by way of distinction from the bare calendar, or fasti diurni. Of this class, the fasti consulares, for example, were a chronicle or register of time, in which the several years were denoted by the respective consuls, with the principal events which happened during their consulates. The fasti triumphales and saeculordates contained a list in chronological order of persons who had obtained a triumph, together with the name of the conquered people, and of the priests. The word fasti thus came to be used in the general sense of "annals" or "historical records." A famous specimen of the same class are the fasti Capitolini, so called because they were deposited in the Capitol by Alexander Farnese, after their excavation from the Roman forum in 1547. They are chiefly a nominal list of statesmen, victories, triumphs, &c., from the expulsion of the kings to the death of Augustus. A considerable number of fasti
of the first class have also been discovered; but none of them appear to be older than the time of Augustus. The Praenestine calendar, discovered in 1770, arranged by the famous gram- 
man Verrius Flaccus, contains the months of January, March, 
April and December, and a portion of February. The tablets 
give an account of festivals, as also of the triumphs of Augustus 
and Tiberius. There are still two complete calendars in existence, 
an official list by Furius Dionysius Philocatus (a.d. 334), and 
a Christian version of the official calendar, made by Polemius Silvius (a.d. 448). But some kinds of fast included under the 
second general head were, from the very beginning, written 
for publication. The Annales Pontilcarum—different from the 
calendaria properly so called—were “annually exhibited in 
public on a white table, on which the memorable events of the 
year, with special mention of the prodigies, were set down in 
the briefest possible manner.” Any one was allowed to copy 
them. Like the pontifices, the augurs also had their books, 
libri augurales. In fact, all the state offices had their fasti 
corresponding in character to the consular fasti named above.

For the best text and account of the fragments of the Fasti see 
Corpus Inscriptionum Latinarum, i. (2nd ed.); on the subject gener- 
ally, Teuffel-Schwabe, Hist. of Roman Literature, §§ 74, 75, and 
article by Bouclé-Leclercq in Darmeregen and Saggio, Dictionnaire 
des Anciennes Langues.

Fasting (from “fast,” derived from old Teutonic fastiog; 
synonyms being the Gr. ἡπείρωση, late Lat. jejunaire), an 
act which is most accurately defined as an abstention from 
meat, drink and all natural food for a determined period. So 
it is defined by the Church of England, in the 16th homily, on 
the authority of the Council of Chalcedon 4 and of the primitive 
church generally. In a looser sense the word is employed to 
denote abstinence from certain kinds of food merely; and this 
meaning, which in ordinary usage is probably the more prevalent, 
seems to have been appropriated by the Church of England 
when it speaks of “fast or abstinence days,” as if fasting and 
abstinence were synonymous. 5 More vaguely still, the word 
is occasionally used as an equivalent for moral self-restraint 
generally. This secondary and metaphorical sense (ἡπείρωσις 
κατάρτισµος) occurs in one of the fragments of Empedocles.

For the physiology of fasting, see Dietetics; Nutrition; also 
Corpulence.

Fasting itself (see also Hunger and Thirst) is of the nature 
of a disease which may be prevented by diet; nevertheless there 
is a peculiar and peculiarly beneficial form of self-denial, very 
practical indeed. “Inedia,” as it is called in the nomenclature 
of diseases by the London College of Physicians, is of two kinds, 
arrising from want of food and from want of water. When entirely 
deprived of nutriment the human body is ordinarily capable of 
supporting life under ordinary circumstances for little more 
than a week. In the spring of 1869 this was tried on the person 
of a “fasting girl” in South Wales. The parents made a show 
of their child, deeking her out like a bride on a bed, and asserting 
that she had eaten no food for two years. Some reckless en- 
thusiasts for truth set four trustworthy hospital nurses to watch 
her; the Celtic obstinacy of the parents was roused, and in 
defence of their imposture they allowed death to take place 
in eight days. Their trial and conviction for manslaughter may 
be found in the daily periodicals of the date; but, strange to 
say, the experimental physiologists and nurses escaped scot-free.

There is no doubt that in this instance the unnatural quietude, 
the grave-like silence, and the dim religious light in which the 
victim was kept contributed to defer death.

One thing which remarkably prolongs life is a supply of water.

The Fathers assembled there . . . decreed in that council that 
every person, as well in his private as public fast, should continue all 
the day without meat and drink, till after the evening prayer. And 
whoever did eat or drink before the evening prayer was ended 
should be accounted and reputed not to consider the purity of his 
fast. This cannot be altogether erroneous; the fast was used in the 
primitive church as by words it cannot be more plainly expressed

(Of Good Works; and first of Fasting.)

As indeed they are, etymologically; but, prior to the Reforma- 
tion, a conventional distinction between abstinente and jejnum 
naturale had long been recognized. “Exceptio edilium quo- 
rundam portionale jejunum est” (Tertullian).

Dogs furnished with as much as they wished to drink were found 
by M. Chossat (Sur l'inanition, Paris, 1843) to live three times as 
long as those who were deprived of solids and liquids at the same 
time. Even wetting the skin with sea-water has been found 
useful by shipwrecked sailors. Four men and a boy of fourteen 
who got shut in the Tynwydd mine near Porth, in South Wales, 
in the winter of 1876-1877 for ten days without food, were not only 
alive when released, but several of them were able to walk, 
and all subsequently recovered. The thorough saturation of the 
nerve space with aqueous vapour, and the presence of drain 
hormones in the cutting, is said to have done well. Experiments 
by the high even temperature always found in the 
lower regions of coal mines, and by the enormous compression 
of the confined air. This doubtless prevented evaporation, 
and retarded vital processes dependent upon oxidation. The 
accumulation of carbonic acid in the breathed air would also 
have a similar arresting power over destructive assimilation. 
These prisoners do not seem to have felt any of the severer pangs 
of hunger, for they were not tempted to eat their candles. With 
the instinctive feeling that darkness adds a horror to death, 
they all preferred to use them for light. At the wreck of the " 
Medusa" frigate in 1791, fifteen people survived on a raft 
for thirteen days without food.

It is a paradoxical fact, that the supply of the stomach even 
from the substance of the starving individual’s body should tend 
to prolong life. In April 1874 a case was recorded of exposure 
in an open boat for 32 days of three men and two boys, with 
it the only provisions, exclusive of old boots and jelly-fish. 
They had a fight in their delirium, and one was severely wounded. 
As the blood gushed out he lapped it up; and instead of suffering 
the fatal weakness which might have been expected from the 
haemorrhage, it seems as if it done well. Experiments were 
performed by a French physician, M. Teuffel-Schwabe, in 
General. de Medicine, 1860, vol. i. p. 109), with the object of trying 
to preserve the lives of dogs by what he calls “artificial 
auto-phagy.” He fed them on the blood taken from their own 
veins daily, depriving them of all other food, and he found 
that the fatal cooling incident to starvation was thus postponed, 
and existence prolonged. Life lasted till the emaciation had 
proceeded to six-tenths of the animal’s weight, as in Chossat’s 
experiments, extending to the fourteenth day, instead of ending 
on the tenth day, as was the case with other dogs which were 
not fed.

Various people have tried, generally for exhibition purposes, 
how long they could fast from food with the aid merely of water 
or some medicinal preparation; but these exhibitions cannot be 
held to have proved anything of importance. A man named 
Jacques in this way fasted at Edinburgh for thirty days in 1888, 
and in London for forty-two days in 1890, and for fifty days in 
1891; and an Italian named Cassa fasted for forty days in 1890.

Religious Fasts.—Fasting is of special interest when considered 
as a discipline voluntarily submitted to for moral and religious 
ends. As such it is very widely diffused. Its modes and motives 
are very considerably according to climate, race, civilization, 
and other circumstances. But it would be difficult to name any 
religious system of any description in which it is wholly un- 
recognized. 3 The origin of the practice is very obscure. 4 In his 
Principles of Sociology Herbert Spencer collected, from the 
accounts we have of various savage tribes in widely separated 
areas, and confutanism ought perhaps to be named as one. 
Zoroastrianism is frequently given as another, but hardly correctly. In the Liber 
Sacramentorum we read, “Caro et sanguine non 
man a mane ad vesperam mibi comedere non est bonum in religione 
nostra”; but according to the Père de Chimon (Lyons, 1671) the 
Pater religionis, being asked if he ate anything upon the priesthood at least, no fewer than five 

During the middle ages the prevalent notion was that it had its 
origin in the celebration of the Pascha. The most ancient of this idea is to be found 
in Tertullian, who says: “Accipere Adam a Deo legem non gustandi de 
aboriode agnitione boni et mali, moriturus si gasterat; verem 
ipsa tene in poenitentiam reveres . . . facilius ventri quam Dei 
cessit, paulo potius quam praecepto annuit, solutum gula vendidit, 
mundavit denique et perit, salvis alioquin si uni arbuculae 
ejunare maluisset” (De jejunio, c. 3).
FASTING

could be entered upon, the sins of the people had to be confessed and (sacramentally) expiated. The fast was a suitable concomitant of that contrition which befitted the occasion. The practice of stated fasting was not in any other case enjoined by the law; and it is generally understood to have been forbidden on Sabbath. At the same time, private and occasional fasting, being regarded as a natural and legitimate instinct, was regulated rather than repressed. The only other provision about fasting in the Pentateuch is the reference in Num. xxi. 14 (13), to the effect that a vow made by a woman "to afflict herself" may in certain circumstances be cancelled by her husband.

The history of Israel from Moses to Ezra furnishes a large number of instances in which the fasting instinct was obeyed both publicly and privately, locally and nationally, under the influence of sorrow, or fear, or passionate desire. See, for example, Judg. xx. 26; 1 Sam. vii. 6 (where the national fast was joined with the ceremony of pouring out water before the Lord); Jer. xxxvi. 6, 9; and 2 Sam. xii. 16. Sometimes the observance of such fasts extended over a considerable period of time, during which, of course, the stricter jejunium was conjoined with abstinencia (Dan. x. 2). Sometimes they lasted only for a day. In Jonah iii. 6, 7, we have an illustrative example of the rigour with which a strict fast might be observed; and such passages as Joel ii. and Isa. lviii. 5 enable us to picture with some vividness the outward accompaniments of a Jewish fast day before the exile.

During the exile many occasional fasts were doubtless observed by the scattered communities, in sorrowful commemoration of the various sad events which had issued in the downfall of the kingdom of Judah. Of these, four appear to have passed into general use—the fasts of the 40th, 4th, 5th and 7th months—commemorating the beginning of the siege of Jerusalem, the capture of the city, the destruction of the temple, the assassination of Gedaliah. As time rolled on they became invested with increasing sanctity; and though the prophet Zechariah, when consulted about them at the close of the exile (Zech. viii. 19), had by no means encouraged the observance of them, the rebuilding of the temple does not appear to have been considered an achievement of sufficient importance to warrant their discontinuance. It is worthy of remark that Ezekiel's prophetic legislation contains no reference to any fast day; the book of Esther (ix. 31), on the other hand, records the institution of a new fast on the 13th of the 1st month.

In the post-exile period private fasting was much practised by the pious, and encouraged by the religious sentiment of the time (see Judith viii. 6; Tob. xii. 8, and context; Sirach xxxiv. 26; Luke i. 37 and xviii. 12). The last reference contains an allusion to the weekly fasts which were observed on the 2nd and 5th days of each week, in commemoration, it was said, of the ascent and descent of Moses at Sinai. The real origin of these fasts and the date of their introduction are alike uncertain; it is manifest, however, that the observance of them was voluntary, and never made a matter of universal obligation. It is probable that the Sadducees, if not also the Essenes, wholly neglected them. The second book (Seder Mod) of the Mishna contains two tractates bearing upon the subject of fasting. One (Yoma, "the day") deals exclusively with the rites which were to be observed on the great day of expiation or atonement; the other (Taanith, "fast") is devoted to the other fasts, and

4 See Judith viii. 6. "And yet it may be a question whether they (the Jews) did not always fast upon Sabbath," says Hooker (E.P. 72, 7), who gives a curious array of evidence pointing in this direction. He even cites a passage from N. T.; but it may be thought to tell the other way. Justinian's phrase, "Sabbata Judaeorum a Mose in omne aevum jejunio dicta" (l. xxxvi. c. 7; 349), is accounted for by the fact that the day of atonement is called Sabbath Sabbath ("a perfect Sabbath").

There is, as Graf (Gesch. Bücher des A.T. p. 41) has pointed out, no direct evidence that the fast on the 10th of the 7th month was ever observed before the exile. But the inference which he draws from this silence of the historical books is manifestly a precarious one at best. Bleek calls Lev. xvi. 1 (ein deutliches Beispiel Mosaischer Ablassung) (Einleitung, p. 31, ed. 1879).

1 Principles of Sociology, i. pp. 170, 284, 285. Compare the passage in the appendix from Hauensh, Sozialer Mythos, p. 408.

2 Spencer, Princip. of Sociology, 272 & c.; P. 377 & c.

3 Hooker, E.P. v. 72.

4 In the Westminster Assembly's Larger Catechism fasting is mentioned among the duties required by the second commandment.

5 The Brahmins themselves on the eleventh day after the full moon and the eleventh day after the new moon for sixty hours from noon (as a kind of sustenance); and there are decided fasts even on Monday in November. See Picart, The Religion and Manners of the Brahmins.

6 It is here to be taken as substantially equivalent to "desire," "appetite."
FASTING

195

deals especially with the manner in which occasional fasting is to be
gone about if no rain shall have fallen on or before the 17th
day of Marcheschwan. It is enacted that in such a case the
rabbis shall begin with a light fast of three days (Monday,
Thursday, Monday), i.e. a fast during which it is lawful to
work, and also to wash and anoint the person. Then, in the event of a
continued drought, fasts of increasing intensity are ordered;
and as a last resort the ark is to be brought into the street and
sprinkled with ashes, the heads of the Nasi and Ab-beth-din being
at the same time similarly sprinkled. 1 In no case was any
fast to be allowed to interfere with any other fixed
deflation. Another institution treated with considerable
seriousness in the Talmudic Teanhth is that of the ṩr ṩm (virii stationis),
who are represented as having been laymen severally representing
the twenty-four classes or families into which the whole
commonwealth of the laity was divided. They used to attend
the temple in rotation, and be present at the sacrifices; and as
this duty fell to each in his turn, the men of the class or family
which he represented were expected in their several cities and
places of abode to engage themselves in religious exercises,
and especially in fasting. The suggestion will readily occur that
had this been the case with the Christians, the fasts of Tertullian
nor any other of the fathers seems to have been aware of the existence of any such institution among the Jews;
and very probably the story about it may have been a comparatively
late invention. It ought to be borne in mind that the
Arabic portion of the Megilath Taanith (a document considerably
older than the treatises in the Mishna) gives a catalogue
only of the days on which fasting was forbidden. The Hebrew
part (commented on by Maimonides), in which numerous fasts
are recommended, is of considerably later date. See Relan,
Practice of the Early Christian Church.—Jesus Himself did not
inculcate asceticism in His teaching, and the absence of that
distinctive element from His practice was sometimes a subject
of hostile remark (Matt. xi. 19). We read, indeed, that on one
certain day He fasted forty days and forty nights; but the expression,
which is an obscure one, possibly means nothing more than that He
endured the privations ordinarily involved in a stay in the wilderness.
While we have no reason to doubt that He observed the one great national fast prescribed in the written
law of Moses, we have express notice that neither He nor His
disciples were in the habit of observing the other fasts which
collected and tradition and experience had fixed for the people.
See Matt. vii. 18, xxi. 43; and the correct reading appears to be—" The disciples of John, and the Pharisees, were fasting" (some customary fast). He never
formally forbade fasting, but neither did He ever enjoin it.
He assumed that, in certain circumstances of sorrow and need,
the fasting instinct would sometimes be felt by the community
and the individual; what He was chiefly concerned about was
to warn His followers against the mistaken aims which His
contemporaries were so apt to contemplate in their fasting
(Matt. vi. 16-18). In one passage, indeed, He has been understood
as practically commanding resort to the practice in certain
circumstances. It ought to be noted, however, that in Acts
xxvii. 27 is probably spurious; and that in Mark ix. 29 the words "and fasting" are omitted by Westcott and Hort as
well as by Tischendorf on the evidence of the Cod. Sinaiticus
(first hand) and Cod. Vaticanus.2 The reference to "the fast" in
Acts xxvii. 9 has generally been held to indicate that the
apostles continued to observe the yearly Jewish fast. But this
inference is by no means a necessary one. According to Acts
xiii. 2, 3, xiv. 23, they conjoined fasting with prayer at ordina
tions, and doubtless also on some other solemn occasions; but at
the same time the liberty of the Christian "in respect of an
holiday, or of the new moon, or of the Sabbath" was strongly
insisted on, by one of them at least, who declared that meat
whether taken or abstained from commendeth not to God (Col.
ii. 16-23; 1 Cor. viii. 8; Rom. xiv. 24-25; 1 Tim. iv. 3-5).
The fastings to which the apostle Paul alludes in 2 Cor. vi. 5,
xii. 27, were rather of the nature of inevitable hardships cheerfully
endured in the discharge of his sacred calling. The words
which appear to encourage fasting in 1 Cor. vii. 5 are absent
from all the oldest manuscripts and are now omitted by all
critics; and on the whole the precept and practice of the New
Testament, while recognizing the propriety of occasional and
extraordinary fasts, seem to be decidedly hostile to the imposition
of any of a stated, obligatory and general kind.
The usage of the Christian church during the earlier centuries
was in turn reflected in some degree by the practice of the
Jews, and was profoundly influenced by traditional Jewish feeling, and by the force of old habit, quite as much as by
any direct apostolic authority or supposed divine command.
Habitual temperance was of course in all cases regarded as an
absolute duty; and "the bridegroom" being absent, the present
life was regarded as being in a sense one continual "fast." Fasting in the stricter sense was not unknown; but it is certain
that it did not at first occupy nearly so prominent a place in
Christian ritual as to that which it afterwards attained. There
are early traces of the customary observance of the Wednesday
and Friday fasts by the apostles and their followers (Clem. Alex. Strom. viii.
877), and also of a "quadrigesimal" fast beneath Constantine. But
the very passage which proves the early origin of "quadra
gesima," conclusively shows how uncertain it was in its character,
and how unlike the Catholic "Lent." Irenaeus, quoted by
Eusebius (v. 24), informs us with reference to the customary
yearly celebration of the mystery of the resurrection of our Lord,
that disputes prevailed not only with respect to the day, but also with respect to the manner of fasting in connexion with it.
"For some think that they ought to fast only one day, some
two, some more days; some compute their day as consisting of
forty hours night and day; and this diversity existing among
those that observe it is not a matter that has been certain in
our times, but long ago among those before us." It was not
pretended that the apostles had legislated on the matter, but
the general and natural feeling that the anniversaries of the
crucifixion and the resurrection of Christ ought to be celebrated
by Christians took expression in a variety of ways according to
the differing tastes of individuals. No other stated fasts, besides
those already mentioned, can be adduced from the time before
Irenaeus; but there was also a tendency—not unnatural in itself—already sanctioned by Jewish practice—to fast by
way of preparation for any season of peculiar privilege. Thus,
according to Justin Martyr (Apol. ii. 93), catechumens were
accustomed to fast before baptism, and the church fasted with
them. To the same feeling the quadrigesimal fast which (as
already stated) preceded the joyful feast of the resurrection,
is to be, in part at least, attributed. As early as the time of
Tertullian it was also usual for communicants to prepare themselves by fasting for receiving the eucharist. But that
Christian fasts had not yet attained to the exaggerated importance which they afterwards assumed is strikingly shown in the well-known
Shepherd of Hermas (ib. iii. vm. v.), where it is declared that
"with merely outward fasting nothing is ever attained," and
the believer is exhorted chiefly to abstain from evil and seek
to cleanse himself from feelings of covetousness, and impurity,
and revenge: "on the day that thou fastest content thyself with
bread, vegetables and water, and thank God for these. But
reckon up on this day what thy meal would otherwise have cost thee, and give the amount that it comes to to some poor widow
or orphan, or to the poor." The right of bishops to ordain special
fasts, "ex aliqua sollicitudinis ecclesiasticae causa" (Tertullian),
was recognized.
Later Practice of the Church.—According to an expression
preserved by Eusebius (H.E. v. 18), Montanus was the first to
give laws (to the church) on fasting. Such language, though
rhetorical in form, is substantially correct. The treatise of
Tertullian,—Concerning Fasting: against the Carnal,—written as
later as the year 197, shows clearly the current of thought.
it was under Montanistic influence, is doubly interesting, first as showing how free the practice of the church down to that time had been, and then as foreshadowing the burdensome legislation which was destined to succeed. In that treatise (c. 15) he approves indeed of the church practice of not fasting on Saturdays and Sundays (as elsewhere, De corona, c. 3), he had expressed his concurrence in the other practice of observing the entire period between Easter and Pentecost as a season of joy; but otherwise he evinces great dissatisfaction with the indifference of the church as to the number, duration and severity of her fasts.\(^1\) The church thus came to be more and more involved in discussions as to the number of days to be observed, especially in “Lent,” as fast days, as to the hour at which a fast ought to terminate (whether at the 3rd or at the 9th hour), as to the rigour with which each fast ought to be observed (whether by abstinence from flesh merely, *absteminìca*, or by abstinence from lacticiina, *xerophagia*, or by literal *jejuniun*), and as to the penalties by which the laws of fasting ought to be enforced. Almost a century, however, elapsed between the composition of the treatise of Tertullian (cir. 212) and the first recorded instances of ecclesiastical legislation on the subject. These, while far from indicating that the church had attained unanimity on the points at issue, show progress in the direction of the later practice of catholicism. About the year 306 the synod of Illiberis in its 26th can, decided in favour of the observance of the Saturday fast.\(^2\) The council of Ancyra in 314, on the other hand, found it necessary to legislate in a somewhat different direction,—by its 14th can enjoining its priests and clerks at least to taste meat at the love feasts.\(^3\) The synod of Laodicea framed several rules with regard to the observance of “Lent,” such as that “during Lent the bread shall not be offered except on Saturday and Sunday” (can. 49), that “the fast shall not be relaxed on the Thursday of the last week of Lent, thus dishonouring the whole season; but the fast shall be kept throughout the whole period” (can. 50), that “during the fast no feasts of the martyrs shall be celebrated” (can. 51), and that “no wedding or birthday feasts shall be celebrated during Lent” (can. 52). The synod of Hippo (393 A.D.) enacted that the sacrament of the altar should always be taken fasting, except on the Thursday before Easter. Protests in favour of freedom were occasionally raised, not always in a very wise manner, or on very wise grounds, by various individuals such as Eustathius of Sebaste (cir. 309), and John of a Roman monk (c. 285). Of the Eustathians, for example (whose connexion with Eustathius can hardly be doubted), the complaint was made that “they fast on Sundays, but eat on the fast-days of the church.” They were condemned by the synod of Gangra in Paphlagonia in the following canons:—Can. 19, “If any one fast on Sunday, let him be anathema.” Can. 20, “If any one do not keep the fasts universally commanded and observed by the whole church, let him be anathema.” Jovinian was very moderate. He did not allow himself to be hurried on by an inconsiderate zeal to condemn fasting, the life of celibacy, monachism, considered purely in themselves. . . . He merely sought to show that men were wrong in recommending so highly and indiscriminately the life of celibacy and fasting, though he was ready to admit that both under certain circumstances might be good and useful” (Neander). He was nevertheless condemned (390) both by Pope Siricius at a synod in Rome, and by Ambrose at another in Milan. The views of Aelius, according to the representations of his bitter opponent Epiphanius (H. E. 75, “Adv. Aelium”), seem on this head at least, though unpopular, to have been characterized by great wisdom and sobriety. He did not condemn fasting altogether, but thought that it ought to be resorted to in the spirit of gospel freedom according as each occasion should arise. He found fault with the church for having substituted for Christian liberty a yoke of Jewish bondage.\(^4\)

Towards the beginning of the 5th century we find Socrates (439) enumerating (H. E. v. 22) a long catalogue of the different fasting practices of the church. The Romans fasted three weeks continuously before Easter (Saturdays and Sundays excepted). In Illyria, Achaia and Alexandria the quadragesimal fast lasted six weeks. Others (the Constantinopolitanists) began their fasts seven weeks before Easter, but fasted only on alternate weeks, five days at a time. Corresponding differences as to the manner of abstinence occurred. Some abstained from all living creatures; others ate fish; others fish and fowl. Some abstained from eggs and fruit; some confined themselves to bread; some would not even eat that. Some fasted till three in the afternoon, and then took whatever they pleased. “Other nations,” adds the historian, “observe other customs in their fasts, and that for various reasons. And since no one can show any written rule about this, it is plain the apostles left this matter free to every one’s liberty and choice, that no one should be compelled to do a thing out of necessity or fear.” When Leo the Great became pope in 440, a period of more rigid uniformity began. The imperial authority of Valentinian helped to bring the whole West at least into submission to the see of Rome; and ecclesiastical enactments had, more than formerly, the support of the civil power. Though the introduction of the four Ember seasons was not entirely due to him, as has sometimes been asserted, it is certain that their widespread observance was due to his influence, and to that of his successors, especially of Gregory the Great. The tendency to increased rigour may be discerned in the 2nd canon of the synod of Orleans (541), which declares that every Christian must observe the fast of Lent, and, in case of failure to do so, is to be punished according to the laws of the church by his spiritual superior; in the 9th canon of the synod of Toledo (653), which declares the eating of flesh during Lent to be a mortal sin; in Charlemagne’s law for the newly conquered Saxony, which attaches the penalty of death to wanton disregard of the holy season. Barinus mentions that in the 12th century those who ate flesh during Lent were liable to have their teeth knocked out. But it ought to be remembered that this severity of the law early began to be tempered by the power of good thing out of necessity and fear.”

It is probable that the apparent severity of the medieval Latin Church on this subject was largely due to the real strictness of the Greek Church, which, under the patriarch Photius in 864, had taken what was virtually a new departure in its fasting praxis. The rigour of the fasts of the modern Greek Church is well known; and it can on the whole be traced back to that comparatively early date. Of the nine fundamental laws of that
The practice of fasting among different communities and religious institutions can vary widely. Fasting has been a significant aspect of many religious practices throughout history, and its importance and observance can differ significantly between various faiths and traditions. For instance, during Advent in the Roman Catholic Church, the practice of fasting is observed, with restrictions varying in severity among different countries and periods. Fasting is often seen as a form of penance, discipline, and preparation for significant religious events. Therefore, the specific practices and rules regarding fasting can differ greatly, reflecting the diverse nature of religious observance.
beneficial than occasional fasting. It is extremely questionable, in particular, whether fasting be so efficient as it is sometimes supposed to be in preventing against temptation to fleshly sin. The practice has a well-ascertained tendency to excite the imagination; and in so far as it disturbs that healthy and well-balanced interaction of body and mind which is the best or at least the normal condition for the practice of virtue, it is to be deprecated rather than encouraged (Theologische Ethik, sec. 873-875).

Mahomedan Fasts.—Among the Mahomedans, the month Ramadan, in which the first part of the Koran is said to have been received, is by command of the prophet observed as a fast with extraordinary rigour. No food or drink of any kind is permitted to be taken from daybreak until the appearance of the stars at nightfall. Extending as it does over the whole month of raging heat, such a fast manifestly involves considerable self-denial; and it is absolutely binding upon all the faithful whether at home or abroad. Should its observance at the appointed time be interfered with by sickness or any other cause, the fast must be kept as soon afterwards as possible for a like number of days. It is the only one which Mahomedanism enjoins; but the doctors of the law recommend a considerable number of voluntary fasts, as for example on the tenth day of the month Moharram. This day, called the "Yom Ashoora," is held sacred on many accounts:—"because it is believed to be the day on which the first meeting of Adam and Eve took place after they were cast out of paradise; and that on which Noah went out from the ark; also because several other great events are said to have happened on this day; and because the ancient Arabs, before the time of the prophet, observed it by fasting. But what, in the opinion of most modern Moslems, and especially the Persians, confers the greatest sanctity on the day of Ashoora is the fact of its being that on which El-Hoseyn, the prophet's grandson, was slain a martyr at the battle of the plain of Karbala. It is the practice of many Moslems to fast on this day, and some do so on the preceding day also. Mahomet himself called fasting the "gate of religion," and forbade it only on the two great festivals, namely, on that which immediately follows Ramadan and on that which succeeds the pilgrimage. (See Lane, Modern Egyptians, chaps. iii., xxiv.)

FASTOLF, SIR JOHN (d. 1459). English soldier, has enjoyed a monument in a part of the prototype of Shakespeare's Falstaff. He was a son of a Norfolk gentleman, John Fastolf, of Caister, is said to have been squire to Thomas Mowbray, duke of Norfolk, before 1398, served with Thomas of Lancaster in Ireland during 1405 and 1406, and in 1408 made a fortunate marriage with Millicent, widow of Sir Stephen Scrope of Castle Combe in Wiltshire. In 1413 he was serving in Gascony, and took part in all the subsequent campaigns of Henry V. in France. He must have earned a good repute as a soldier, for in 1422 he was made governor of Maine and Anjou, and in February 1426 a knight of the Garter. But later in this year he was superceded in his command by John Talbot. After a visit to England in 1428, he returned to the war, and on the 12th of February 1429 when in charge of the convoy for the English army before Orleans defeated the French and Scots at the "battle of herrings." On the 18th of June of the same year an English force under the command of Fastolf and Talbot suffered a serious defeat at Patay. According to the French historian Waurin, who was present, the disaster was due to Talbot's rashness, and Fastolf only fled when resistance was hopeless. Other accounts charge him with cowardice, and it is true that John of Bedford at first deprived him of the Garter, though in later years he was honourably reinstated. This incident was made unfavourable use of by Shakespeare in Henry VI. (pt. i. act iv. sc. 1.) Fastolf continued to serve with honour in France, and was trusted both by Bedford and by Richard of York. He only came home finally in 1440, when past sixty years of age. But the scandal against him continued, and during Cade's rebellion in 1451 he was charged with having been the cause of the English disasters through mishining the garrisons of Normandy. It is suggested that he had made much money in the war by the hire of troops, and in his later days he showed himself a grasping man of business. A servant wrote of him:—"crue and vengible he hath been ever, and for the most part without pity and mercy" (Paston Letters, i. 389). Besides his share in his wife's property he had large estates in Norfolk and Suffolk, and a house at Southwark, where he also owned the Boar's Head Inn. He died at Caister on the 5th of November 1459. There is some reason to suppose that Fastolf favoured Lollardy, and this circumstance with the tradition of his bragget cowardice made many suggest the use of his name for the boon companion of Prince Hal, when Shakespeare found it expedient to drop that of Oldcastle. In the first two folios the name of the historical character in the first part of Henry VI. is given as "Falstaff" not Fastolf. Other points of resemblance between the historic Fastolf and the Falstaff of the dramatist are to be found in their service under Thomas Mowbray, and association with a Boar's Head Inn. But Falstaff is in no true sense a dramatization of the real soldier. The facts of Fastolf's early career are to be found chiefly in the chronicles of Monstrelet and Waurin. For his later life there is much material, including a number of his own letters, in the Paston Letters. There is a full life by W. Oldys in the Biographia Britannica (1st ed.), and Gough in his Clarendon History of Caister Castle, Scrope's History of Castle Combe. J. Gauchet's essay On the Historical Element in Shakespeare's Falstaff; ap. Studies in the History, Sources, and Methodology of the History of England, by W. R. Lee's article in the Dictionary of National Biography, and D. W. Duthie, The Use of Sir John Falstaff in the History of England (1907).

(C. L. K.)

FAT (O. E. faest; the word is common to Teutonic languages, cf. Dutch vel, Ger. Fett, &c., and may be ultimately related to Greek πύω and πυρήβ, and Sanskrit pītāna), the name given to certain animal and vegetable products which are oily solids at ordinary temperatures, and are chemically distinguished as being the glyceral esters of various fatty acids, of which the most important are stearic, palmitic, and oleic; it is to be noticed that they are non-nitrogenous. Fat is a normal constituent of animal tissue, being found even before birth; it occurs especially in the intra-muscular, the abdominal and the subcutaneous connective tissues. In the vegetable kingdom fats especially occur in the seeds and fruits, and sometimes in the roots. Physiological subjects concerned with the part played by fats in living animals are treated in the articles CONNECTIVE TISSUES; NUTRITION; CONCIPUCENCE; METABOLIC DISEASES. The fats are chemically similar to the fixed oils, from which they are roughly distinguished by being solids and not liquids (see Oils). While all fats have received industrial applications, foremost importance must be accorded to the fats of the domestic animals—the sheep, cow, ox and calf. These, which are extracted from the bones and skins in the first operation in the manufacture of glue, are the raw materials of the soap, candle and glycerin industries.

FATALISM (Lat. fatum, that which is spoken, decreed); strictly the doctrine that all things happen according to a prearranged fate, necessity or inexorable decree. It has frequently been associated with determinism (q.e.), which, however, differs from it categorically in assigning a certain function to the will. The essence of the fatalistic doctrine is that it assigns no place at all to the initiative of the individual, or to rational sequence of events. Thus an oriental may believe that he is fated to die on a particular day; he believes that, whatever he does and in spite of all precautions he may take, nothing can avert the disaster. The idea of an omnipotent fate overruling all affairs of men is present in various forms in practically all religious systems. Thus Homer assumes a single fate (Μοῖρας), an impersonal power which makes all human concerns subject to him. Man is powerless in the face of Zeus whose word is spoken of as weighing out the fate of men (H. xxii. 209, viii. 60). Hesiod has three Fates (Μοῖρας), daughters of Night, Clotho, Lachesis and Atropos. In Aeschylus fate is powerful even over the gods. The Epicureans regarded fate as blind chance, while to the Stoics everything is subject to an absolute rational law. The doctrine of fate appears also in what are known as the higher religions, e.g. Christianity and Mahomedanism. In the
former the ideas of personality and infinite power have vanished, all power being conceived as inherent in God. It is recognized that the moral individual must have some kind of initiative, and yet since God is omnipotent and omniscient man must be conceived as in some sense foreordained to a certain moral, mental and physical development. In the history of the Christian church emphasis has from time to time been laid specially on the latter aspect of human life (cf. the doctrines of election, foreordination, determinism). Even these theologians, however, who have laid special stress on the limitations of the human will have repudiated the strictly fatalistic doctrine which is characteristic of Oriental thought and is the negation of all human initiative (see PREDESTINATION; AUGUSTINE, SAINT; WILL). In the Fates (Moerae, Fata, or Kairos) the fate is an absolute power, known as Kismet, or Nasib, which is conceived as inexorable and transcending all the physical laws of the universe. The most striking feature of the Oriental fatalism is its complete indifference to material circumstances: men accept prosperity and misfortune with calmness as the decree of fate.

**FATE**, in Roman mythology, the spoken word *(fatum)* of Jupiter, the unalterable will of heaven. The plural (Fata, the Fates) was used for the "destinies" of individuals or cities, and their for the three goddesses who controlled them. Thus the Fata Sibihunda were the goddesses who wrote down a man's destiny at his birth. In this connexion, however, Fata may be singular, the masculine and feminine *Fatus, Fata*, being the usual forms in popular and ceremonial language. The Fates were also called Parcae, the attributes of both being the same as those of the Greek Moerai.

**FATEHPUR, FATHHPUR or FUTUREHPUR**, a town and district of British India, in the Allahabad division of the United Provinces. The town is 73 m. by rail N.W. of Allahabad. Pop. (1901) 19,281.

The district has an area of 1618 sq. m. It is situated in the extreme south-eastern corner of the Doab or tract of country between the Ganges and the Jumna, which respectively mark the northern and southern boundaries. The whole district consists of an alluvial plain formed by the deposits of the two great rivers. The central part is almost perfectly level, and consists of highly cultivated land interspersed with jungles and with tracts impermeated with saltpetre (usur). A ridge of higher land, forming the watershed of the district, runs along it from east to west at an average distance of about 5 m. from the Ganges. Fatehpur therefore consists of two inclined planes, the one 3 m. broad, sloping down rapidly to the Ganges, and the other from 15 to 20 m. broad, falling gradually to the Jumna. The country near the banks of the two rivers is cut up into ravines and nullahs running in all directions, and is almost entirely uncultivable. Besides the Ganges and Jumna the only rivers of importance are the Pandu, a tributary of the Ganges, and the Arind and Nun, which both fall into the Jumna. The climate is more humid than in the other districts of the Doab, and although fever is common, it is not considered an unhealthy district. The average annual rainfall is 34 in.

The tract in which this district is comprised was conquered in 1194 by the Pathans; but subsequently, after a desperate resistance, it was wrested from them by the Moors under the command of the Shah of Karah, and was under the government of the wazir of Oudh. In 1736 it was overrun by the Mahrattas, who retained possession of it until, in 1750, they were ousted by the Pathans of Fatehpur. In 1753 it was reconquered by the nawab of Oudh. In 1765, by a treaty between the East India Company and the nawab, Karah was made over to the Delhi emperor, who retained it till 1774, when it was again restored to the nawab wazir's dominions. Finally in 1801, the nawab, by treaty, reconveyed it to the Company in commutation of the amount which he had stipulated to pay in return for the defence of his country. In June 1857 the district rose in rebellion, and the usual operations of Europeans took place. Order was established after the fall of Lucknow, on the return of Lord Clyde's army to Cawnpore. In 1901 the population was 686,391, showing a decrease of 2 % in the decade. The district is traversed by the main line of the East Indian railway from Allahabad to Cawnpore. Trade is mainly agricultural, but the town of Fatehpur is noted for the manufacture of ornamental whips, and Jalargani for artistic curtains, &c.

**FATEHPUR SIKRI**, a town in the Agra district in the United Provinces of India, on the road from Agra to Jaipur. Pop. (1901) 7147. It is a ruined city, and is interesting only from an archaeological point of view. It was founded by Akbar in 1569 as a thank-offering for the birth of a son, Selim, afterwards the emperor Jahangir, foretold by Selim Chisti, a famous Mahomedan saint. The principal building is the great mosque, which is said by Ferguson to be hardly surpassed by any in India. It measures 550 ft. east and west by 470 ft. north and south, and the mosque itself, 250 ft. by 50 ft., is crowned by three domes. In its courtyard, which measures 350 ft. by 150 ft., stand two tombs. One is that of Selim Chisti, built of white marble, and the windows with pierced traceries of the most exquisite geometrical patterns. It possesses besides a deep cornice of marble, supported by brackets of the most elaborate design. The other tomb, that of Nawab Islam Khan, is sober and in excellent taste, but quite eclipsed by its surroundings. Even these parts, however, are surpassed in magnificence by the southern gateway. As it stands on a rising ground, when looked at from below its appearance is noble beyond that of any portal attached to any mosque in India, perhaps in the whole world." Among other more noteworthy buildings the following may be mentioned. The palace of Jodh Bai, the Rajput wife of Akbar, consists of a courtyard surrounded by a gallery, above which rise buildings roofed with blue enameled. A rich gateway gives access to a terrace on which are the "houses of Birbal and Miriam"; and beyond these is another courtyard, where are Akbar's private apartments and the exquisite palace of the Turkish sultana. Here are also the Panch Mahal or five storeyed building, consisting of five galleries in tiers, and the audience chamber. The special feature in the architecture of the city is the softness of the red sandstone, which could be carved just as easily as wood, and so lent itself readily to the elaborate Hindu embellishment. Fatehpur Sikri was a favourite residence of Akbar throughout his reign, and his establishment here was of great magnificence. After Akbar's death Fatehpur Sikri was deserted within 50 years of its foundation. The reason for this was that frequent cause in the East, lack of water. The only water obtainable was so brackish and corrodimg as to cause great mortality among the inhabitants. The buildings are situated within an enclosure, walled on three sides and about 7 m. in circumference. They are all now more or less in ruins, many of the elaborate pilasters and other decorations having largely perished, but some modern restoration has been effected.

**FATHER**, the begetter of a child, the male parent. The word is common to Teutonic languages, and, like the other words for close family relationship, mother, brother, son, sister, daughter, appears in most Indo-European languages. The O. Eng. form is *fader*, and it appears in Ger. Vater, Dutch vader, Gr. *patris*, Lat. *pater*, whence Romanic Fr. *père*, Span. *padre*, &c. From the Latin *pater* much of the concept of the male parent, and of ancestors in general, is derived. It is applied to God, as the Father of Jesus Christ, and as the Creator of the world, and is thus the orthodox term for the First Person of the Trinity. Of the transferred uses of the word many have religious reference; thus it is used of the Christian writers, usually confined to those of the first five centuries, the Fathers of the Church (see below), of whom those who flourished at the end of, or just after the age of, the apostles are known as the Apostolic Fathers. One who stands as a spiritual parent to another is his "father," e.g. godfather, or in the title of bishops or archbishops, Right or Most Reverend Father in God. The pope is, in the Roman Church, the Holy Father. In the Roman Church, father is strictly applied to a "regular," a member of one of the religious orders, and so always in Europe, in English usage, often applied to a confessor, whether regular or secular, and to any Roman priest, and sometimes used of sub-members of a religious society or fraternity
in the English Church. Of transferred uses, other than religious, may be mentioned the application to the first founders of an institution, constitution, epoch, &c. Thus the earliest settlers of North America are the Pilgrim Fathers, and the framers of the United States constitution are the Fathers of the Constitution. In ancient Rome the members of the senate are the Patres conscripti, the "Conspectus fathers." The senior member or doyen of a society is often called the father. Thus the member of the English House of Commons, and similarly, of the House of Representatives in the United States, America, who has sat for the longest period uninterruptedly, is the Father of the House.

**FATHERS OF THE CHURCH.** The use of the word "father" as a title of respect is found in the Old Testament, where it is applied to Moses (Exod. 24:10, 11, 12; Deut. 1:18, 31; Judges 9:1); priests (Judg. xvii. 10, xviii. 19, 10, prophets (2 Kings ii. 12, vi. 21, xiii. 14), and distinguished ancestors (Eccles. xlv. 1). In the time of our Lord the scribes claimed the name with an arrogance which He disapproved (Matt. xxiii. 9); in the rabbinic literature "the fathers" are the more eminent of the earlier rabbis whose sayings were handed down for the guidance of posterity.1 The Christian Church, warned perhaps by the words of Christ, appears at first to have avoided a similar use of the term, while St. Paul, St. Peter and St. John speak of their converts as spiritual children (1 Cor. iv. 14, Gal. iv. 16, 1 Pet. v. 13, 1 John ii. 12); they did not assume it more commonly than the official style of "fathers in God." Nor is this title found in the age which succeeded that of the apostles. When Polycarp, bishop of Smyrna, was martyred (A.D. 155), the crowd shouted, "This is the father of the Christians" 2; but the words were probably prompted by the Jews, who took a prominent part in the martyrdom, and who naturally viewed Polycarp in the light of a great Christian rabbi, and gave him the title which their own teachers bore. In the next century members of the episcopal order were sometimes addressed in this manner: thus Cyprian is styled papa, or papa by his Roman correspondents.3 The bishops who sat in the great councils of the 4th century were known as "the 38 fathers" of Nicaea, and "the 150 fathers" of Constantinople. Meanwhile the custom was growing up of applying to eminent Church writers of a past generation under this name. Thus Athanasius writes (ad Afros vi.): "We have the testimony of fathers (the two Dionysii, bishops of Alexandria and Rome, who wrote in the previous century) for the use of the word έπισκόποις." Such quotations were multiplied, as theologians learnt to depend increasingly upon their predecessors, until the testimony of "our holy father" Athanasius, or Gregory the Great, or John the Golden-mouthed, came to be regarded as decisive in reference to controverted points of faith and practice.

In the narrower sense thus indicated the "fathers" of the Church are the great bishops and other eminent Christian teachers of the earlier centuries, who were conspicuous for soundness of judgment and sanctity of life, and whose writings remained as a court of appeal for their successors. A list of bishops drawn up on this principle will begin with the Christian writers of the 1st century whose writings are not included in the New Testament. For convenience sake, the principal of the Greek writers of the New Testament, and of the Greek Church. More liberal estimate might include John Scottus Erigena or even Anselm or Bernard of Clairvaux in the West and Photius in the East. The abbe Migne carried his Latin patrology down to the time of Innocent III. (d. 1216), and his Greek patrology to the fall of Constantinople (1453); but, while this large extension of the field is much to the advantage of his readers, it undoubtedly stretches the meaning of patrologia far beyond its natural limits. For ordinary purposes it is best to make the patristic period conterminous with the life of the ancient Catholic Church. In the West the Church enters the medieval stage of its history with the death of Gregory, while in the East even John of Damascus is rather a compiler of patristic teaching than a true "father." A further question arises. Are all the Christian writers of a given period to be included among the "fathers," or those only who wrote on religious subjects, and of whose orthodoxy there is no doubt? Migne, following the example of the editors of *biblia sacra completa* who preceded him, swept into his great collection all the Christian writings which fell within his period; but he is careful to state upon his title-page that his patrologies include the ecclesiastical writers as well as the fathers and doctors of the Church. For a comprehensive use of the term "ecclesiastical writers" he has the authority of Jerome, who enumerates among them such heresiarchs or leaders of schism as Tatian, Bardas, Novatian, Lightfoot, St. Cyprian, and Eusebius; his list may not be logical, but long usage has made it permissible or even necessary. It is often difficult, if not impracticable, to draw the line between orthodox writers and heterodox; on which side, it might be asked, is Origen to be placed? and in the case of a writer like Tertullian who left the Church in middle life, are we to admit certain of his works into our patrology and refuse a place to others? It is clear that in the circumstances the terms "father," "patristic," or "patrology" must be used with much caution, since it is now too late to substitute for the former two new and more comprehensive terms.

By the "fathers," then, we understand the whole of extant Christian literature from the time of the apostles to the rise of scholasticism or the beginning of the middle ages. However we may interpret the lower limit of this period, the literature which it embraces is immense. Some method of subdivision is necessary, and the simplest and most obvious is that which breaks the whole into two great parts, the ante-Nicene and the post-Nicene. This is not an arbitrary cleavage; the Council of Nicaea (A.D. 325) is the watershed which actually separates two great tracts of Christian literature. The ante-Nicene age yields priceless records of the early struggles of Christianity; from it we have received specimens of the early apologetic and the early polemic of the Church, the first essays of Christian philosophy, Christian correspondence, Christian biblical interpretation: we owe to it the works of Justin, Irenaeus, the Alexanderian Clement, Origen, Tertullian, Cyprian. In these products of the 2nd and 3rd centuries there is much which in its own way was not surpassed by any of the later patristic writings. Yet the post-Nicene literature, considered as literature, reaches a far higher level. Both in East and West, the 4th and 5th centuries form the golden age of dogmatic teaching, of homiletic preaching, of exposition, of letter-writing, of Church history, of religious poetry. Two causes may be assigned for this fact. The conversion of the empire gave the members of the Church leisure and opportunities for the cultivation of literary taste, and gradually drew the educated classes within the pale of the Christian society. Moreover, the great Christological controversies of the age tended to encourage in Christian writers and preachers an intellectual acuteness and an accuracy of thought and expression of which the earlier centuries had not felt the need.

Christian literature opens with the "apostolic fathers," i.e. the Church writers who flourished toward the end of the apostolic age and during the half century that followed it, including Clement of Rome, Ignatius of Antioch, Polycarp of Smyrna and the author known as "Barnabas." Their writings, like those of the apostles, are epistolary; but editions of the apostolic fathers are not usually admitted also the early Church order known as the Didache, the apocalypse entitled the Shepherd, and a short anonymous apology addressed to one Diognetus. A second group, known as the "Greek Apologists," embraces Aristides, Justin, Tatian, Athenagoras and Theophilus; and a third consists of the early polemical writers, Irenaeus and

1 See Buxtorf, s.v. Abh, and cf. the title of the tract *Perikr Abh* (ed. Tailor, p. 3).

*In his book *De vitris illustribus*. The term *pater apostolicus* is due to the patristic scholars of the 17th century. For the term *pater apostolicus*, *St. Clement of Rome*, i. p. 5, "Sub apostolic" is perhaps a more accurate designation."
Hippolytus. Next come the great Alexandrians, Clement, Origen, Dionysius; the Carthaginians, Tertullian and Cyprian; the Romans, Minucius Felix and Novatian; the last four laid the foundations of a Latin Christian literature. Even the stormy days of the last persecution yielded some considerable writers, such as Methodius in the East and Lactantius in the West. This list is far from complete; the principal collections of the ante-Nicene fathers include not a few minor and anonymous writers, and the fragments of many others whose works as a whole have perished.

In the post-Nicene period the literary output of the Church was greater. Only the more representative names can be mentioned here. From Alexandria we get Athanasius, Didymus and Cyril; from Cyrene, Synesius; from Antioch, Theodore of Mopsuestia, John Chrysostom and Theodoret; from Palestine, Eusebius of Caesarea and Cyril of Jerusalem; from Cappadocia, Basil, Gregory of Nyssa and Gregory of Nazianzus. The Latin West was scarcely less productive; it is enough to mention Hilary of Poitiers, Ambrose of Milan, Augustine of Hippo, Leo of Rome, Jerome, Rufinus, and a father lately restored to his place in patristic literature, Niceta of Remesiana.1 Gaul alone has a goodly list of Christian authors to show: John Cassian, Vincent of Lérins, Hilary of Arles, Prosper of Aquitaine, Salvin of Marseilles, Sidonius Apollinaris of Auvergne, Caesarius of Arles, Gregory of Tours. The period ends in the West with two great Italian names, Cassiodorus and Pope Gregory I., after Leo the greatest of papal theologians.

The reader to whom the study is new will gain some idea of the bulk of the extant patristic literature, if we add that in Migne's collection the sixty-six large volumes are occupied with the Greek fathers from Clement of Rome to John of Damascus, and seventy-six with the Latin fathers from Tertullian to Gregory the Great.3

For a discussion of the more important fathers the student is referred to the articles which deal with them separately. In this place it is enough to consider the general influence of the patristic writings upon Christian doctrine and biblical interpretation. Can any authority be claimed for their teaching or their exegesis, other than that which belongs to the best writers of every age? The decree of the council of Trent4 (ut nemo . . . contra unanimum concorsen patrum ipsum scripturam sacram interpreter audeat) is studiously moderate, and yet it seems to rule that under certain circumstances it is not permitted to the Church of later times to carry the science of biblical interpretation beyond the point which it had reached at the end of the patristic period. Roman Catholic writers,5 however, have explained the prohibition to apply to matters of faith only, and in that case the Tridentine decree is little else than another form of the Vincentian canon which has been widely accepted in the Anglican communion: curandum est ut id tenetamus quod ubique, quod semper, quod ab omnibus credidit esset. The fathers of the first six or seven centuries, so far as they agree, may be fairly taken to represent the main stream of Christian tradition and belief during the period when the apostolic teaching took shape in the great creeds and dogmatic decisions of Christendom. The English reformers realized this fact; and notwithstanding their insistence on the unique authority of the canon of Scripture, their appeal to the fathers as representatives of the teaching of the undivided Church was as wholehearted as that of the Tridentine divines. Thus the English canon of 1571 directs preachers to take heed that they do not teach anything in their sermons as though they had always been held by the people save what is agreeable to the doctrine of the Old and New Testaments, and what the Catholic Fathers and ancient Bishops have gathered from that doctrine.5 Depreciation of the fathers was characteristic, not of the Anglican reformation, but of the

1 The editio princeps of Niceta's works was published by Dr A. E. Burn in 1905.

4 Corpus scriptorum ecclesiasticorum Latinorum.

revolt against some of its fundamental principles which was led by the Puritan reaction.6

Now that the smoke of these controversies has passed away, it is possible to form a clearer judgment upon the merits of the patristic writings. They are no longer used as an armoury from which opposite sides may draw effective weapons, offensive or defensive; nor on the other hand are they cast aside as the rubbish of an ignorant and superstitious age. All patristic students now recognize the great inequality of these writers, and admit that they are not free from the faults of their times; it is not denied that much of their exegesis is untenable, or that their logic is often feeble and their rhetoric offensive to modern taste. But against these disadvantages may be set the unique services which the fathers still render to Christian scholars. Their works comprise the whole literature of our faith during the decisive centuries which followed the apostolic age. They are important witnesses to the text of the New Testament, to the history of the canon, and to the history of interpretation. It is to their pages that we owe nearly all that we know of the life of ancient Christianity. We see in them the thought of the ancient Church taking shape in the minds of her bishops and doctors; and in many cases they express the results of the great doctrinal controversies of their age in language which leaves little to be desired.6

AUTHORITIES.—The earliest writer on patristics was Jerome, whose book De viris illustribus gives a brief account of one hundred and twelve Church fathers, written beginning with himself. Jerome's work was continued successively by Gennadius of Marseilles, Isidore of Seville, and Hefeleuson of Tholos; the last-named writer brings the list down to the middle of the 7th century. Thereafter the learning for which the Mohammedans were famous seems to have been numerous; among the more recent and most accessible of these we may mention Smith and Wace's Dictionary of Christian Biography, Hauck-Herzog's Realencyclopdie, Badenewer's Patrologie und Geschichte der altkirchlichen Literatur, Harnack's Liegeschicht der altchristlichen Literatur bei Eusebius and Ehrard's Die altchristlichen Literatur und ihre Erforschung. A record of patristic collections and translations down to the 19th century may be found in Dowling's Notitia Scriptorum SS. Patrum. The contents of the volumes of Migne's patrology are given in the Catalogue general des livres de l'abbé Migne, and a useful list in alphabetical order of the writers in the Greek Patrology has been compiled by Dr J. B. Pearson (Cambridge, 1882). Migne's texts are not always satisfactory, but since the completion of his great undertaking two important collections have begun on a critical basis—the Vienna edition of the Latin Church writers6 and the Best Edition of the Greek writers of the ante-Nicene period.7

For English readers there are three series of translations from the father's works which cover much of the ground: the Oxford Library of the Fathers, the Ante Nicene Christian Library and the Select Library of Nicene and Post-Nicene Fathers. Satisfactory lexicons of patristic Greek and Latin are still a desideratum: but assistance may be found in the study of the Greek father's Institutes, the Lexicon of Byzantine Greek by E. A. Sophocles, and the Lexico Graecum suppletorium et dialecticum of Van Herwerden; whilst the new great Latin Lexicon, published by the Berlin Academy, is calculated to meet the needs of students of Latin patristic literature. For a fuller list of books useful to the reader of the Greek and Latin fathers see H. B. Swete's Patristic Study (2nd ed., 1902). (H. B. S.)

PATHOM (a word common, in various forms, to Scandinavian and Teutonic languages; cf. Danish far, Dutch voorn and Ger. Faden, and meaning "the arms extended"; the ultimate origin is a root peet, seen in the Gr. πεταλωμα, to spread), a measure of length, being the distance from the tip of one middle finger to the tip of the other, when the arms are stretched out to their widest extent. This length has been Peter and Paul's measure of 6 ft., and as such is used mainly in soundings as a unit for measuring the depth of the sea. "Pathom" is also used in the measurement of timber, when it is equivalent to 6 ft. 9 in.; similarly, in mining, a fathom is a portion of ground running the whole thickness of the vein of ore, and is 6 ft. in breadth and thickness. The verb "to fathom," i.e. to sound or measure with a fathom-line, is used figuratively, meaning to go into a subject deeply, to penetrate, or to explore thoroughly. The Pathom, or Fathom, is a measure of 6 ft., and is 6 ft. in breadth and thickness. The verb "to fathom," i.e. to sound or measure with a fathom-line, is used figuratively, meaning to go into a subject deeply, to penetrate, or to explore thoroughly.
FATIMITES, or Fatimides, the name of a dynasty called after Fatima, daughter of the prophet Mahomet, from whom and her husband the Calif Ali, son of Abu Talib, they claimed descent. The dynasty is also called 'Obaïdi (Ubaidi) after 'Obaïdallah, the first sovereign, and 'Alawi, a title which it shares to have other dynasties claiming the same ancestry. For a list of sovereigns see Egypt, section History (Mahomedan period); three, however, must be prefixed who reigned in north-western Africa before the annexation of Egypt: al-Mahdi 'Obaïdallah 297 (909); al-Qa'im Mohammed 322 (934); al-Mansur Isma'il 334 (943).

The dynasty owed its rise to the attachment to the family of the prophet which was widespread in the Moslem world, and the belief that the sovereignty was the right of one of its members. Owing, however, to the absence of the principle of primogeniture the difference of opinion as to the person whose claim should be enforced, and a number of sects arose maintaining the rights of different branches of the family. The Fatimites were supported by those who regarded the sovereignty as vested in Isma'il, son of Ja'far al-Sadiq, great-great-grandson of Ali, through his second son Hosain (Husain). Of this Isma'il the first Fatimite caliph was supposed to be the great-grandson. The line of ancestors between him and Isma'il is, however, variously given, even his father's name being quite uncertain, and in some of the pedigrees even Isma'il does not figure. Apparently when the family first became of political importance their Alid descent was not disputed at Bagdad, and the poet al-Sharîf al-Radi (d. A.H. 466: A.D. 1075), in whose family the office of Naqib (register of the Alids) was hereditary, appears to have acknowledged it (Dittân, ed. Beirut, p. 972). When their success became a menace to the caliphs of Bagdad, genealogists were employed to demonstrate the falsity of the claim, and a considerable literature, both official and unofficial, rose in consequence. The founder of the dynasty was made out to be a scion of a family of heretics from whom the terrible Carmathian sect had originated: later on (perhaps owing to the rôle played by Jacob son of Kilius, in his origin from Egypt, the founder was made out to have been a Jew, either as having been adopted by the heretic supposed to be his father, or as having been made to personate the real 'Obaïdallah, who had been killed in captivity. While the stories that make him of either Jewish or Carmathian origin may be neglected, as the product of malice, the uncertainty of the genealogies offered by their partisans renders any positive solution of the problem impossible. What seems to be clear is that secretly within the Abbasid empire propaganda was carried on in favour of one or other Alid aspirant, and the danger which any such aspirant incurs when he advances forward over the protest of the sovereigns. In June 903 another army was sent to deal with al-Shi'i, and an earnest appeal came from the caliph Muqtatil (Moktafi), addresssed to all the Moslems of Africa, to aid Ziyâdâtallah against the usurper. The operations of the Aghlabite prince were unproductive of any decided result, and by September 906 al-Shi'i had got possession of the important fortress Tubna and some others. Further forces were immediately sent to the front by Ziyâdâtallah, but these were defeated by al-Shi'i and his officers, to whom other towns capitulated, till Ziyâdâtallah found it prudent to retire from al-Uribs or Larrus, which had been his headquarters, and entrench himself in Raqqâda, one of the two capitals of his kingdom. Kattâlîn being on the other hand Ziyâdâtallah is charged by the chroniclers with dissoluteness and levity, and even cowardice: after his retreat the fortresses and towns in what now constitute the department of Constantine and in Tunisia fell fast into al-Shi'i's hands, and he was soon able to threaten Raqqâda itself.

By March 909 Raqqâda had become untenable, and Ziyâdâtallah resolved to flee from his kingdom; taking with him his chief possessions, he made for Egypt, and thence to 'Irak: his final fate is uncertain. The cities Raqqâda and Kairâwan were immediately occupied by al-Shi'i, who proceeded to send governors to the other places of importance in what had been the Aghlabide kingdom, and to strike new coins, which, however, bore no sovereign's name. Orders were given that the Shi'ite peculiarities should be introduced into public worship.

In May 909 al-Shi'i led a tremendous army westwards to the kingdom of Tabert, where he put an end to the Rustamite dynasty, and appointed a governor of his own: he thence proceeded to Sijilmasa where 'Obaïdallah lay imprisoned, with the intention of releasing him and placing him on the throne. After a brief attempt at resistance, the governor fled, and al-Shi'i proceeded to his released Kattâlîn, at which place he left the army as the long-promised Imam. The day is given as the 26th of August 909. 'Obaïdallah had been in prison more than three years. Whether his identity with the Mahdi for whom al-Shi'i had been fighting was known to the governor of Sijilmasa is uncertain. If it was, the governor and his master the Aghlabide sovereign might have been expected to make use of their knowledge and outwit al-Shi'i by putting his Mahdi to death. Opponents of the Fatimites assert that this was actually done, and that the Mahdi presented to the army was not the real 'Obaïdallah, but (as usual) a Jewish captive, who had been suborned to play the rôle.

The chief command was now assumed by 'Obaïdallah, who took the title "al-Mahdi, Commander of the Faithful," thereby claiming the headship of the whole Moslem world; Raqqâda
was at the first made the seat of the court, and the Shi'ite doctrines were enforced on the inhabitants, not without encountering some opposition. Revolts which arose in different parts of the Aghlabite kingdom were, however, speedily quelled.

The course followed by 'Obaidallah in governing independently of al-Shi'i soon led to dissatisfaction on the part of the latter, who, urged on it is said by his brother, decided to dethrone their Mahdi, and on the occasion of an expedition to Ténès, which al-Shi'i commanded, organized a conspiracy with that end. The conspiracy was betrayed to 'Obaidallah, who took steps to defeat it, and on the last day of July 911 contrived to assassinate both al-Shi'i and his brother. Thus the procedure which had characterized the accession of the 'Abbāsid dynasty was repeated. It has been conjectured that these assassinations lost the Fatimites the support of the organized army, and continued to exist in the East, whence the Carmathians figure as an independent and even hostile community, though they appear to have been amenable to the influence of the African caliph.

'Obaidallah had now to face the dissatisfaction of the tribes whose allegiance al-Shi'i had won, especially the Kutama, Zenata and Lawata: the uprising of the first assumed formidable proportions, and they even elected a Mahdi of their own, one Kādī b. Mu'ārik al-Mawātī, who promulgated a new revelation for their guidance. They were finally defeated by 'Obaidallah's son, Abu'l-Qāsim Mahommēd, who took Constantine, and succeeded in capturing the new Mahdi, whom he brought to Raqqādā. Other opponents were got rid of by 'Obaidallah by ruthless executions. By the middle of the year 913 by his own and his son's efforts he had brought his kingdom into order. After the style of most founders of dynasties he then selected a site for a new capital, to be called after his title Mahdīyya (q.v.), on a peninsula called Hama (Capo Africa) S.S.E. of Kairwān. Eight years were spent in fortifying this place, which in 921 was made the capital of the empire.

After defeating internal enemies 'Obaidallah turned his attention to the remaining 'Abbāsid possessions in Africa, and his general Habās b. Yāsūf in the year 913 advanced along the northern coast, taking various places, including the important town of Barca, his progress, it is said, being marked by great cruelty. He then advanced towards Egypt, and towards the end of July 914, being reinforced by Abu'l-Qāsim, afterwards al-Qā'im, entered Alexandria. The danger led to measures of unusual energy being taken by the Bagdad caliph Moqtadir, an army being sent to Egypt under Mu'nis, and a special post being organized between that country and Bagdad to convey messages uninterruptedly. The Fatimite forces were defeated, partly owing to the insubordination of the general Habāsīn, in the winter of 914, and returned to Barca and Kairwān with great loss.

A second expedition was undertaken against Egypt in the year 919, and on the 10th of July Alexandria was entered by Abu'l-Qāsim, who then advanced southward, seizing the Fayum and Ushmu'nain (Eshmunain). He was presently reinforced by a fleet, which, however, was defeated at Rosetta in March of the year 920 by a fleet despatched from Tarsus by the 'Abbāsid caliph Moqtadir, most of the vessels being burned. Through the energetic measures of the caliph, who sent repeated reinforcements to Fostat, Abu'l-Qāsim was compelled in the spring of 921 to evacuate the places which he had seized, and return to the west with the remains of his army, which had suffered much from plague as well as defeat on the field. On his return he found that the court had migrated from Raqqādā to the new capital Mahdīyya (q.v.). Meanwhile other expeditions had been despatched by 'Obaidallah towards the west, and Nekor (Nakur) and Fes had been forced to acknowledge his sovereignty.

The remaining years of 'Obaidallah's reign were largely spent in dealing with uprisings in various parts of his dominions, the success of which at times reduced the territory in which he was recognized to a small area. 'Obaidallah died on the 4th of March 923, and was succeeded by Abu'l-Qāsim, who took the title al-Qā'im bimar allah. He immediately after his accession occupied himself with the

reconquest of Fez and Nekor, which had revoked during the last years of the former caliph. He also despatched a fleet under Ya'qūb b. Ishaq, which ravaged the coast of France, took Genoa, and plundered the coast of Calabria before returning to Africa. A third attempt made by him to take Egypt resulted in a disastrous defeat at Dḥāt al-Humān, after which all the remains of the expedition retreated in disorder to Barca.

The later years of the reign of Qā'im were troubled by the uprising of Abū Yazīd Mahkhd al-Zenātī, a leader who during the former reign had acquired a following among the tribes inhabiting the Jebel Aures, including adherents of the 'Ībāḍī sect. After having fled for a time to Mecca, this person returned in 937 to Taizzūr (Touzer), the original seat of his operations, and was imprisoned by Qā'im's order. His sons, aided by the inhabitants of al-Zenātī, succeeded in forcing the prison, and releasing their father, was, it seems, able to organize a counter-power on a vast scale, and by the end of 943 was strong enough to take the field against the Fatimite sovereign, whom he drove out of Kairwān. Abū Yazīd proclaimed himself a champion of Sunnite doctrine against the Shi'is, and ordered the legal system of Mālik to be restored in place of that introduced by the Fatimites. Apparently the doctrines of the latter has as yet won little popularity, and Abū Yazīd won an enormous following, except among the Kutama, who remained faithful to Qā'im. On the last day of October 944, an engagement was fought between Kairwān and Mahdiyya, a place called Al-Khawān, which resulted in the rout of Qā'im's forces, and the caliph's being shortly after shut up in his capital, the suburbs of which he defended by a trench. Abū Yazīd's forces were ill-suited to maintain a protracted siege, and since, owing to the former caliph's forethought, the capital was in a condition to hold out for a long time, many of them deserted and the besiegers gained no permanent advantage. After the siege had lasted some ten months Abū Yazīd was compelled to raise it (September 945); the struggle, however, did not end with that event, and for a time the caliph and Abū Yazīd continued to fight with varying fortune until Anṣār got possession of most of the caliph's dominions. On the 15th of January 946, Abū Yazīd shut up Qā'im's forces in Susa which he then besieged, and attempted to take by storm.

On the 18th of May 945, while Abū Yazīd was besieging Susa, the caliph al-Qā'im died at Mahdīa, and was succeeded by his son Ismā'īl, who took the title Maṣūr. He almost immediately relieved Susa by sending a fleet, which, joining with the garrison inflicted a severe defeat on Abū Yazīd, who had to evacuate Kairwān also; but though the cities were mainly in the hands of Fatimite prefects, Abū Yazīd was able to maintain the field for more than two years longer, while his followers were steadily decreasing in numbers, and he was repeatedly driven into the deserts of the Sahara. In August 947 his last stronghold was taken, and he died of wounds received in defending it. His sons carried on some desultory warfare against Maṣūr after their father's death. A town called Maṣūrīa or Șābrā was built adjoining Kairwān to celebrate the decisive victory over Abū Yazīd, which, however, did not long preserve its name. The exhausted condition of north-west Africa due to the protracted civil war required some years of peace for recuperation, and further exploits are not recorded for Maṣūr, who died on the 10th of March 951.

His son, Abū Tamīm Ma'dād, was twenty-two years of age at the time, and succeeded his father with the title Mo'izz liddīn allah. His authority was acknowledged over the greater part of the region now constituting Morocco, Algeria and Tunisia, as well as Sicily, and he appears to have had serious thoughts of endeavouring to annex Spain. At an early period in his reign he made Jauhar, who had been secretary under the former caliph, commander of the forces, and the services rendered by this person to the dynasty made him count as its second founder after al-Shīʿ. In the years 958 and 959 he was sent westwards to reduce Fez and other places where the authority of the caliph had been repudiated, and after a successful expedition advanced as far as the Atlantic. As early as 966 the plan of
attempting a fresh invasion of Egypt was conceived, and preparations made for its execution; but it was delayed, it is said at the request of the caliph's mother, who wished to make a pilgrimage to Mecca first; and her honourable treatment by Kâfir when she passed through Egypt induced the caliph to postpone the invasion till that sovereign's death.

In August 972 Mo'izz resolved to follow Jâhâr's pressing invitation to enter his new capital Cairo. With his arrival there the centre of the Fatimite power was transferred from Mahdîya and Kâirâwân to Egypt, and their original dominion became a province called al-Maghrib, which immediately fell into the hands of a hereditary dynasty, the Zeitârs, acknowledging Fatimite suzerainty. The first sovereign was Bulûkkin, also called Abu'l-Putûb Yusuf, appointed by Mo'izz as his viceroy on the occasion of his departure for Egypt: separate precepts were appointed for Sicily and Tripoli; and at the first the minister of finance was to be an official independent of the governor of the Maghrib. On the death of Bulûkkin in 984 he was succeeded by a son who took the royal title al-Manṣûr, whose rule an attempt was made by the Kutâma, instigated by the caliph, to shake off the yoke of the Zeitârs, who originated from the Sanhaja tribe. This attempt was defeated by the energy of Manṣûr in 988; and the sovereignty of the Fatimites in the Maghrib became more and more confined to recognition in public prayer and on coins, and the payment of tribute and the giving of presents to the viziers at Cairo. The fourth ruler of the Zeitâr dynasty, called Mo'izz, endeavoured to substitute 'Abbasid suzerainty for Fatimite: his land was invaded by Arab colonies sent from Jâhâr to enslave his new capital Cairo. With Mo'izz fought a decisive engagement, after which the dominion of the Zeitârs was restricted to the territory adjoining Mahdîya; a number of smaller kingdoms rising up around them. The Zeitârs were finally overthrown by Roger II. of Sicily in 1148.

After the death of al-Adîd, the last Fatimite caliph in Egypt, some attempts were made to place on the throne a member of the family, and at one time there seemed a chance of the Assassins, who formed a branch of the Fatimite sect, assisting in this project. In 1174 a conspiracy for the restoration of the dynasty was organized by 'Umârah of Yemen, a court poet, with the aid of eight officials of the government: it was discovered, and those who were implicated were executed. Two persons claiming Fatimite descent took the royal titles al-Mo'tâsîm billah and al-Ḥâmid îllah in the years 1175 and 1176 respectively; and as late as 1192 we hear of pretenders in Egypt. Some members of the family are traceable till near the end of the 7th century of Islam.

The doctrines of the Fatimites as a sect, apart from their claim to the sovereignty in Islam, are little known, and we are not justified in identifying them with those of the Assassins, the Carmathians or the Druses, though all these sects are connected with them in origin. A famous account is given by Maqrizî of a system of education by which the neophyte had doubts gently instilled into his mind till he was prepared to have the allegorical meaning of the Koran set before him, and to substitute some form of natural for revealed religion. In most accounts of the early days of the community it is stated that the permission of wine-drinking and licentiousness, and the community of wives and property formed part of its tenets. There is little in the recorded practice of the Fatimite state to confirm or justify these assertions; and they appear to have differed from orthodox Moslems rather in small details of ritual and law than in deep matters of doctrine.

FAUBOURG—FAUCHER

The French name for a portion of a town which lies outside the walls, hence properly a suburb. The name survives in certain parts of Paris, such as the Faubourg St Antoine, and the Faubourg St Germain, &c., which have long since ceased to be suburbs and have become portions of the town itself. The origin of the word is doubtful. The earlier spelling faux-bourg, and the occurrence in medieval Latin of *falsus-burgus* (see Ducange, Glossarium, s.v. "Falsus-Burgus"), was taken as showing its obvious origin and meaning, the sham or quasi-borough. The generally accepted derivation is from *falsus* (Lat. *fortis*, outside the gates), and *bourg*. It is suggested that the word is the French adaptation of the Ger. Pfahlbürger, the burghers of the pale, i.e. outside the walls but within the pale.

FAUCES (a Latin plural word for "throat"); the singular *fau* is rarely found; in anatomy, the hinder part of the mouth, which leads into the pharynx; also an architectural term given by Vitruvius to narrow passages on either side of the tablinum, through which access could be obtained from the atrium to the peristyle court in the rear.

FAUCHER, ÉDARD DE [ÉDARD] (1803-1844), French poet, was born at Limoges on the 8th of September 1803. When he was nine years old the family removed to Toulouse, where the boy was sent to school. His parents were separated in 1816, and Édard Faucher, who resisted his father's attempts to put him to a trade, helped to support himself and his mother during the rest of his school career by designing embroidery and needlework. As a private tutor in Paris he continued his studies in the direction of archaeology and history, but with the revolution of 1830 he was drawn into active political journalism on the Liberal side. He was on the staff of the Temps from 1830 to 1835, when he became editor of the Constitutionnel. In 1838, in his journal of his own, Le Bien public, proved a disastrous financial failure; and his political independence having caused his retirement from the Constitutionnel, he joined in 1834 the Courrier français, of which he was editor from 1839 until 1842, when the paper changed hands. Faucher belonged in policy to the dynastic Left, and consistently preached moderation to the more ardent Liberals. On resigning his connexion with the Courrier français he gave his attention chiefly to economic questions. He advocated a customs union between the Latin countries to counterbalance the German Zollverein, and in view of the impracticability of such a measure narrated his proposal in 1839 to a customs union between France and Belgium. In 1843 he visited England to study the English social system, publishing the results of his investigations in a famous series of Études sur l'Angleterre (2 vols., 1843), published originally in the Revue des deux mondes. He helped to organize the Bordeaux association for free-trade propaganda, and it was as an advocate of free trade that he was elected in 1847 to the chamber of deputies for Reims. After the revolution of 1848 he entered the Constituent Assembly for the department of Marne, where he opposed many Republican measures—the limitation of the hours of labour, the creation of the national relief works in Paris, the abolition of the death penalty and others. Under the presidency of Louis Napoleon he became minister of public works, and then minister of the interior, but his action in seeking to influence the coming elections by a circular letter addressed to the prefects was censured by the Constituent Assembly, and he was compelled to resign office on the 14th of May 1849.

In 1851 he was again minister of the interior until Napoleon declared his intention of resorting to universal suffrage. After the coup d'etat of December he refused a seat in the consultative commission instituted by Napoleon. He had been elected a member of the Academy of Moral and Political Science in 1849, and his retirement from politics permitted a return to his writings on economics. He had been to Italy in search of health in 1854, and was returning to Paris on business when he was seized by typhoid at Marseilles, where he died on the 14th of December 1854.

His miscellaneous writings were collected (2 vols., 1856) as Mélanges d'économie politique et de finance, and his speeches in the legislature are printed in vol. ii. of Léon Faucher, biographie et correspondance (2 vols., 2nd ed., Paris, 1875).
FAUCHET, CLAUDE (1530-1601), French historian and antiquary, was born at Paris on the 3rd of July 1530. Of his early life few particulars are known. He applied himself to the study of the early French chronicles, and proposed to publish extracts which would throw light on the first periods of the monarchy. During the civil wars he lost a large part of his books and manuscripts in a riot, and was compelled to leave Paris. He then settled at Marseilles. Attaching himself afterwards to Cardinal de Tournon, he accompanied him in 1554 to Italy, whence he was several times sent on embassies to the king, with reports on the siege of Nice. At length he procured him the post of president of the chamber des monnaies, and thus enabled him to resume his literary studies. Having become embarrassed with debt, he found it necessary, at the age of seventy, to sell his office; but the king, amused with an epigram, gave him a pension, with the title of historiographer of France. Fauchet has the reputation of an impartial and scrupulously accurate writer; and in his works are to be found important facts not easily accessible elsewhere. He was, however, entirely uncritical, and his style is singularly inelegant. His principal works (1579, 1590) treat of Gaulish and French antiquities and early history, as well as of the origin of the French language and poetry, of the liberties of the Gallican church, &c. A collected edition was published in 1610. Fauchet took part in a translation of the Annals of Tacitus (1582). He died at Paris about the close of 1601.

FAUCHET, CLAUDE (1744-1793), French revolutionary bishop, was born at Dornes (Nièvre) on the 22nd of September 1744. He was a curate of the church of St Roch, Paris, when he was engaged as tutor to the children of the marquis of Choiseul, brother of Louis XV. his minister, an appointment which proved to be the first step to fortune. He was successively grand vicar to the Bishop of Bourges, preacher to the king, and abbé of Montfort-Lacarré. The "philosophic" tone of his sermons caused his dismissal from court in 1788 before he became a popular speaker in the Parisian sections. He was one of the leaders of the attack on the Bastille, and on the 4th of August 1789 he delivered an eloquent discourse by way of funeral sermon for the citizens slain on the 14th of July, taking as his text the words of St Paul, "Ye have been called to liberty." He blessed the tricolour flag for the National Guard, and in September was elected to the Commune, from which he retired in October 1790. During the next winter he organized within the Palace Royal the "Social Club of the Society of the Friends of Truth," presiding over crowded meetings under the self-assumed title of procureur général de la vérité. Nevertheless, events were marching faster than his opinions, and the last occasion on which he carried his public with him was a sermon preached at Notre-Dame on the 14th of February 1791. In May he became constitutional bishop of Calvados, and was presently returned by the department to the Legislative Assembly, and afterwards to the Convention. At the king's trial he voted for the appeal to the people and for the penalty of imprisonment. He protested against the execution of Louis XVI. in the Journal des amis (January 26, 1793), and next month was denounced to the Convention for prohibiting married priests from the exercise of the priesthood in his diocese. He remained secretary to the Convention until the accusation of the Girondists in May 1793. In July he was imprisoned on the charge of supporting the federalist movement at Caen, and with complicity with Charlotte Corday, whom he had taken to see a sitting of the Convention on her arrival in Paris. Of the second of these charges he was certainly innocent. With the Girondist deputies he was brought before the revolutionary tribunal on the 30th of October, and was guillotined on the following day.

See Mémoires . . . ou Lettres de Claude Fauchet (5th ed., 1793); Notes sur Claude Fauchet (Caen, 1842).

FAUCIT, HELENA SAVILLE (1817-1858), English actress, the daughter of John Saville Faucit, an actor, was born in London. Her first London appearance was made on the 5th of January 1836 at Covent Garden as Julia in The Hunchback. Her success in this was so definitely confirmed by her subsequent acting of Juliet, Lady Teaze, Beatrice, Imogene and Hermione, that within eighteen months she was engaged by Macready as leading lady at Covent Garden. There, besides appearing in several Shakespearian characters, she created the heroine's part in Lytton's Duchess de la Vallière (1836), Lady of Lyons (1838), Richelieu (1839), The Sea Captain (1839), Money (1840), and Browning's Stratford (1837). After a visit to Paris and a short season at the Haymarket, she joined the Drury Lane company under Macready early in 1842. There she played Lady Macbeth, Lynton, afterwards John, of Demona and Imogen, and took part in the first production of Westmoreland in Patrician's Daughter (1842) and Browning's Blot on the Scutcheon (1843). Among her successful tours was included a visit to Paris in 1844-1845, where she acted with Macready in several Shakespearian plays. In 1851 she was married to Mr (afterwards Sir) Theodore Martin, but still acted occasionally for charity. One of her last appearances was as Beatrice, on the opening of the Shakespeare Memorial at Stratford-on-Avon on the 23rd of April 1879. In 1881 there appeared in Blackwood's Magazine the first of her Letters on some of Shakespeare's Heroines, which were published in the course of the year as Shakespeare's Female Characters (1882). Lady Martin died at her home near Llangollen in Wales on the 31st of October 1898. There is a tablet to her in the Shakespeare Memorial with a portrait figure, and the marble pulpit in the Shakespeare church—with her portrait as Saint Helena—was given in her memory by her husband.

See Sir Theodore Martin's Helena Faucit (1900).

FAUJAS DE SAINT-FOND, BARTHELEMY (1741-1819), French geologist and traveller, was born at Montélimart on the 17th of May 1741. He was educated at the Jesuits' College at Lyons, afterwards went to Grenoble, applied himself to the study of law, and was admitted advocate to the parliament. He rose to be president of the seneschal's court (1795), a post which he honourably filled, but the duties of which became irksome, as he had early developed a love of nature and his favourite relaxation was found in visits to the Alps. There he began to study the forms, structure, composition and superposition of rocks. In 1775 he discovered in the Velay a rich deposit of pozzuolana, which in due course was worked by the government. In 1776 he put himself in communication with Buffon, who was not slow to perceive the value of his labours. He was afterwards named the French geologist and written by Louis XVI. assistant naturalist to the museum, to which office was added some years later (1785, 1788) that of royal commissioner for mines. One of the most important of his works was the Recherches sur les volcans étendus du Vivarais et du Velay, which appeared in 1778. In this work, rich in facts and observations, he developed his theory of the origin of volcanoes. In his capacity of commissioner for mines Faujas travelled in almost all the countries of Europe, everywhere devoting attention to the nature and constituents of the rocks. It was he who first recognized the volcanic nature of the basaltic columns of the cave of Fringal (Staffa), although the island was visited in 1772 by Sir Joseph Banks, who remarked that the stone "is a coarse kind of Basaltes, very much resembling the Giants' Causeway in Ireland" (Pennant's Tour in Scotland and Voyage to the Hebrides). Faujas's Voyage en Angleterre, en Écosse et aux Îles Hébrides (1797) is full of interest—containing anecdotes of Sir Joseph Banks and Dr John Whitehurst, and an amusing account of "The Dinner of an Academic Club" (the Royal Society), and has been translated into English (2 vols., 1799). Having been nominated in 1793 professor at the Jardin des Plantes, he held this post till he was nearly eighty years of age, retiring only to his estate of Saint-Fond in Dauphiné. Faujas took a warm interest in the balloon experiments of the brothers Montgolfier, and published a very complete Description des expériences de la machine aérostatique de M. Montgolfier, &c. (1783, 1784). He contributed many scientific memoirs to the Annales and the Mémoires of the museum of natural history. Among his separate works, in addition to those already named are—"Histoire naturelle de la province de Dauphiné (1781, 1782); Minéralogie des volcans..."
FAULT

(1874); and Essai de géologie (1803-1809). Faujas died on the 18th of July 1810.

FAULT (Mid. Eng. faute, through the French, from the popular Latin use of fallere, to fail; the original of the Latin being replaced in English in the 15th century), a failing, mistake or defect.

In geology, the term is given to a plane of dislocation. In a portion of the earth's crust, synonyms used in mining are "trouble," "throw" and "heave"; the German equivalent is Verwerfung, and the French faille. Faults on a small scale are sometimes sharply defined planes,1 as if the rocks had been sliced through and fitted together again after being shifted (fig. 1). In such cases, however, the harder portions of the dislocated rocks will usually be found "slicenosed." More frequently some disturbance has occurred on one or both sides of the fault. Sometimes in a series of strata the beds on the side which has been pushed up are bent down against the fault, while those on the opposite side are bent up (fig. 2). Most commonly the rocks on both sides are considerably broken, jumbled and crumpled, so that the line of fracture is marked by a belt or wall-like mass of fragmentary rock, fault-rock, which may be several yards in breadth. Faults are to be distinguished from joints and fissures by the fact that there must have been a movement of the rock on one side of the fault-plane relatively to that on the other side. The trace of a fault-plane at the surface of the earth is a line (or belt of fault-rock), which in geological mapping is often spoken of as a "fault-line" or "line of fault." Fig. 3 represents the plan of a simple fault; quite frequently, however, the main fault subdivides at the extremities into a number of minor faults (fig. 4), or the main fault may be accompanied by lateral subordinate faults (fig. 5), some varieties of which have been termed flaws or Blatts.

"Fault-planes" are sometimes perpendicular to the horizon, but more usually they are inclined at a greater or lesser angle. The angle made by the fault-plane with the vertical is the hade of the fault (if the angle of inclination were measured from the horizon, as in determining the "dip" of strata, this would be expressed as the "dip of the fault"). In figs. 1 and 2 the faults are hading towards the right of the reader. The amount of dislocation as measured along a fault-plane is the displacement of the fault (for an illustration of these terms see fig. 18, where they are applied to a thrust fault); the vertical displacement is the throw (Fr. rejet); the horizontal displacement, which even with vertical movement must arise in all cases where the faults are not perpendicular to the horizon and the strata are not horizontal, is known as the heave. In fig. 6 the displacement is equal to the throw in the fault A; in the fault B the displacement is more than twice as great as in A, while the throw is the same in both; the fault A has no heave, in B it is considerable. The rock on that side of a fault which has dropped relatively to the rock on the other is said to be upon the downthrow side of the fault; conversely, the relatively uplifted portion is the upthrow side. The two fault faces are known as the "hanging-wall" and the "foot-wall."

The relationship that exists between the hade and the direction of throw has led to the classification of faults into "normal faults," which hade under the downthrow side, or in other words, those in which the hanging-wall has dropped; and "reversed faults," which hade beneath the upthrow side, that is to say, the foot-wall exhibits a relative sinking. Normal faults are exemplified in figs. 1, 2, and 6; in the latter the masses A and B are on the downthrow sides, C is upthrown. Fig. 7 represents a small reversed fault. Normal faults are so called because they are more generally prevalent than the other type; they are sometimes designated "drop" or "gravity" faults, but these are misleading expressions and should be discontenanced. Normal faults are regarded as the result of stretching of the crust, hence they have been called "tension" faults as distinguished from reversed faults, which are assumed to be due to pressure. It is needful, however, to exercise great caution in accepting this view except in a restricted and localized sense, for there are many instances in which the two forms are intimately associated (fig. 8), and a whole complex system of faults may be the result of horizontal (tangential) pressure alone or even of direct vertical uplift. It is often tacitly assumed

---

1 The fault-plane is not a plane surface in the mathematical sense; it may curve irregularly in more than one direction.

---
that most normal and reversed faults are due to simple vertical movements of the fractured crust-blocks; but this is by no means the case. What is actually observed in examining a fault is the apparent direction of motion; but the present position of the dislocated masses is the result of real motion or series of motions, which have taken place along the fault-plane at various angles from horizontal to vertical; frequently it can be shown that these movements have been extremely complicated. The striations and "slicksides" on the faces of a fault indicate only the direction of the last movement.

A single normal fault of large throw is sometimes replaced by a series of close parallel faults, each throwing a small amount in the same direction; if these subordinate faults occur within a narrow width of ground they are known as distribution faults; if they are more widely separated they are called step faults (fig. 9). Occasionally two normal faults hade towards one another and intersect, and the rock mass between them has been let down; this is described as a trough fault (fig. 10). A fault running parallel to the strike of bedded rocks is a strike fault; one which runs along the direction of the 

A broad monoclinal fold is sometimes observed to pass into a fault of gradually increasing throw; such a fault is occasionally regarded as pivoted at one end. Again, a faulted mass may be on the downthrow side towards one end, and on the upthrow side towards the other, the movement having taken place about an axis approximately normal to the fault-plane, the "pivot" in this case being near the centre. From an example of this kind it is evident that the same fault may at the same time be both "normal" and "reversed" (see fig. 8). When the principal movement along a highly inclined fault-plane has been approxi-

Faults which run obliquely across the direction of dip, if they hade with the dip of the strata, will produce offset with "gap" between the outcrops; if they hade in the opposite direction to the dip, offset with "overlap" is caused: in the latter case the crop moves forward (down dip) on the denuded upthrow side, in the former it moves backward. The effect of a strike fault of diminishing throw is seen in fig. 14. Faults crossing folded strata cause the outcrops to approach on the upthrow side of a syncline and tend to separate the outcrops of an antil-

In the majority of cases the upthrown side of a fault has been so reduced by denudation as to leave no sharp upstanding ridge; but examples are known where the upthrown side still
exists as a prominent cliff-like face of rock, a "fault-scarp"; familiar instances occur in the Basin ranges of Utah, Nevada, &c., and many smaller examples have been observed in the areas affected by recent earthquakes in Japan, San Francisco and other places. But although there may be no sharp cliff, the effect of faulting upon topographic forms is abundantly evident wherever a harder series of strata has been brought in juxtaposition to softer rocks. By certain French writers, the upstanding side of a faulted piece of ground is said to have a regard, thus the faults of the Jura Mountains have a "regard français," and in the same region it has been observed that in curved faults the convexity is directed the same way as the regard. Occasionally one or more parallel faults have let down an intervening strip of rock, thereby forming "fault valleys" or Graben (Grabensenken); the Great Rift Valley is a striking example. On the other hand, a large area of rock is sometimes lifted up, or surrounded by a system of faults, which have let down the encircling ground; such a fault-block is known also as a horst; a considerable area of Greenland stands up in this manner.

Faults have often an important influence upon water-supply by bringing impervious beds up against pervious ones or allowing water to flow away that would otherwise be conserved. Springs often rise along the outcrop of a fault. In coal and metal mining it is evident from what has already been said that faults must act sometimes beneficially, sometimes the reverse. It is a common occurrence for fault-fissures and fault-rock to appear as valuable mineral lodes through the inflilling or impregnation of the spaces and broken ground with mineral ores.

In certain regions which have been subjected to very great crustal disturbance a type of fault is found which possesses a very low hade—sometimes only a few degrees from the horizontal—and, like a reversed fault, haides beneath the upthrown mass; these are termed thrusts, overthrusts, or overthrust faults (Fr. recouvrements, failles de chevauchement, charriages; Ger. Überschiebungen, Übersprünge, Wechsel, Fallensverwerfungen). Thrusts should not be confused with reversed faults, which have a strong hade. Thrusts play a very important part in the N.W. highlands of Scotland, the Scandinavian highlands, the western Alps, the Appalachians, the Belgian coal region, &c. By the action of thrusts enormous masses of rock have been pushed almost horizontally over underlying rocks, in some cases for several miles. One of the largest of the Scandinavian thrust
masses is 1120 m. long, 80 m. broad, and 5000 ft. thick. In Scotland three grades of thrusts are recognized, maximum, major, and minor thrusts; the last have very generally been truncated by those of greater magnitude. Some of these great thrusts have received distinguishing names, e.g. the Moine thrust (fig. 19) and the Ben More thrust; similarly in the coal basin of Mons and Valenciennes we find the faille de Bossu and the Grande faille du midi. Overturned folds are frequently seen passing into thrusts. Bayley Williams has classified thrusts as (1) Shear thrusts, (2) Break thrusts, (3) Stretch thrusts, and (4) Erosion thrusts.

Dr. E. S. Warren ("Notes on the Geology of the English Lake District," Proc. Geol. Assoc., 1900) has described a type of fault which may be regarded as the converse of a thrust fault. If we consider a series of rock masses A, B, C—of which A is the oldest and underneath—undergoing thrusting, say from south to north, should the mass C be prevented from moving forward as rapidly as B, a low-hanging fault may form between C and B and the mass C may lag behind; similarly the mass B may lag behind A. Such faults Dr. Marr calls "lag faults." A mass of rock suffering thrusting or lagging may yield unequally in its several parts, and those portions tending to travel more rapidly than the adjoining members in the fault will be broken by fractures. Thus the faster-moving blocks will be separated from the slower ones by faults approximately normal to the plane of movement: these are described as "tear faults."

Faults may occur in rocks of all ages; small local dislocations are observable even in glacial deposits, alluvium and loess. A region of faulting may continue to be so through more than one geological period. Little is known of the mechanism of faulting or of the causes that produce it; the majority of the textbook explanations will not bear scrutiny, and there is room for extended observation and research. The sudden yielding of the strata along a plane of faulting is a familiar cause of earthquakes.

(An. Ge.; J. A. H.)

FAUNA, the name, in Roman mythology, of a country goddess of the fields and cattle, known sometimes as the sister, sometimes as the wife of the god Faunus; hence the term is used collectively for all the animals in any given geographical area or geological period, or for an enumeration of the same. It thus corresponds to the term "flora" in respect to plant life.

FAUNTEROY, HENRY (1785-1824), English banker and forger, was born in 1785. After seven years as a clerk in the London bank of Marsh, Sibbald & Co., of which his father was one of the founders, he was taken into partnership, and the whole business of the firm was left in his hands. In 1824 the bank suspended payment. Faunteroy was arrested on the charge of appropriating trust funds by forging the trustees' signatures, and was committed for trial, it being freely rumoured that he had appropriated £250,000, which he had squandered in debauchery. He was tried at the Old Bailey, and, the case against him having been proved, he admitted his guilt, but pleaded that he had used the misappropriated funds to pay his firm's debts. He was found guilty and sentenced to be hanged. Seventeen merchants and bankers gave evidence as to his general integrity at the trial, and after his conviction powerful influence was brought to bear on his behalf, and his case was twice argued before judges on points of law. An Italian named Angelico, a voyageur, offered to clear Faunteroy's name at the scaffold. The efforts of his many friends were, however, unavailing, and he was executed on the 30th of November 1824. A wholly unfounded rumour was widely credited for some time subsequently to the effect that he had escaped strangulation by inserting a silver tube in his throat, and was living comfortably abroad.

See A. Griffith's Chronicles of Newgate, ii. 294-300, and Pierce Egan's Account of the Trial of Mr. Faunteroy.

FAUNUS (i.e. the "kindly," from Lat. favere, or the "speaker," from farī), an old Italian rural deity, the bestower of fruitfulness on fields and cattle. As such he is akin to or identical with Inus ("fructifier") and Lupericus (see LUPERCALIA). Faunus also revealed the secrets of the future by strange sounds from the woods, or by visions communicated to those who slept within his precincts in the skin of sacrificed lambs; he was then called Fatuus, and with him was associated his wife or daughter Fatua. Under Greek influence he was identified with Pan, and just as there was supposed to be a number of Panisci, so the existence of many Fauni was assumed—misshapen and mischievous goatherds of the forest, with pointed ears, tails and goat's feet, who were supposed to torment sleepers with hideous nightmares. In the poetic tradition Faunus is an old king of Latium, the son of Pius (Mars) and father of Latinus, the teacher of agriculture and cattle-breeding, and the introducer of the religious system of the country, honoured after death as a tutelary divinity. Two festivals called Faunalia were celebrated in honour of Faunus, one on the 13th of February in his temple on the island in the Tiber, the other in the country on the 4th of December (Ovid, Fasti, li. 193; Horace, Odes, iii. 18. 10). At these goats were sacrificed to him with libations of wine and milk, and he was implored to be propitious to fields and flocks. The peasants of Etruria, at the same time annually thrashed the women with dancing in the meadows.

FAURE, FRANCOIS PÉLIX (1841-1899), President of the French Republic, was born in Paris on the 20th of January 1841, being the son of a small furniture maker. Having started as a tanner and merchant at Havre, he acquired considerable wealth, was elected to the National Assembly on the 21st of August 1881, and took his seat as a member of the Left, interesting himself chiefly in matters concerning economies, railways and the navy. In November 1882 he became under-secretary for the colonies in M. Ferry's ministry, and retained the post till 1886. He held the same post in M. Tirard's ministry in 1888, and in 1889 was made vice-president of the chamber. In 1894 he obtained cabinet rank as minister of marine in the administration of M. Dupuy. In the January following he was unexpectedly elected president of the Republic upon the resignation of M. Casimir-Perier. The principal cause of his elevation was the determination of the various sections of the moderate republican party to exclude M. Brisson, who had had a majority of votes on the first ballot, but had failed to obtain an absolute majority.

To accomplish this end it was necessary to unite among themselves, and union could only be secured by the nomination of some one who offended nobody. M. Faure answered perfectly to this description. His fine presence and his tact on ceremonial occasions rendered the state some service when in 1896 he received the Tsar of Russia at Paris, and in 1897 returned his visit, after which meeting the momentous Franco-Russian alliance was publicly announced. The latter days of M. Faure's presidency were embittered by the Dreyfus affair, which he was determined to regard as "close jungle." But at a critical moment in the proceedings his death occurred suddenly, from apoplexy, on the 16th of February 1899. With all his faults, and in spite of no slight amount of personal vanity, President Faure was a shrewd politician, and a good public functionary. After his death, some alleged extracts from his private journals, dealing with French policy, were published in the Paris press.

See E. Maillard, Le Président F. Faure (Paris, 1897); P. Blusy, Pélix Faure intime (1898); and F. Martin-Ginouvier, F. Faure devant l'histoire (1898).

FAURE, GABRIEL (1845- ), French musical composer, was born at Pamiers on the 13th of May 1845. He studied at the school of sacred music directed by Niedermeyer, first under Dietrich, and subsequently under Saint-Saëns. He became "maître de chapelle" at the church of the Madeleine in 1877, and organist in 1896. His works include a symphony in D minor (Op. 40), two quartets for piano and strings (Op. 15 and 45), a suite for orchestra (Op. 12), sonata for violin and piano (Op. 13), concerto for violin (Op. 14), berceuse for violin, élegie for violoncello, pavana for orchestra, incidental music for Alexandre Dumas' Caligula and De Haraucourt's Shylock,
FAURIEL—FAUST

a requiem, a cantata, The Birth of Venus, produced at the Leeds festival in 1808, a quantity of piano music, and a large number of songs. Fauré occupies a place by himself among modern French composers. He delights in the impreu, and loves to wander through labyrinthine harmonies. There can be no denying the intense fascination and remarkable originality of his music. His muse is essentially aristocratic, and suggests the surroundings of the boudoir and the perfume of the hot-house.

FAURIEL, CLAUDE CHARLES (1772—1844), French historian, philologist and critic, was born at St Étienne on the 21st of October 1772. Though the son of a poor joiner, he received a good education in the Oratorian colleges of Tournon and Lyons. He was twice in the army—at Perpignan in 1793, and in 1796—1797 at Briançon, as private secretary to General J. Servan de Gerbey (1741—1808); but he preferred the civil service and the companionship of his friends and his books. In 1794 he returned to St Etienne, where, but only for a short period, he filled a municipal office; and from 1797 to 1799 he devoted himself to strenuous study, more especially of the literature and history, both ancient and modern, of Greece and Italy. Having paid a visit to Paris in 1799, he was introduced to Fouché, minister of police, who induced him to become his private secretary. Though he discharged the duties of this office to Fouché’s satisfaction, his strength was overtasked by his continued application to study, and he found it necessary in 1801 to recruit his health by a three months’ trip in the south. In resigning his office in the following year he was actuated as much by these considerations as by the schemes he put forward in serving longer under Napoleon, when the latter, in violation of strict republican principles, became consul for life. This is clearly shown by the fragments of Memoirs discovered by Ludovic Lalanne and published in 1886.

Some articles which Fauriel published in the Décade philosophique (1800) on a work of Madame de Staël’s—De la littérature considérée dans ses rapports avec les institutions sociales—led to an intimate friendship with her. About 1802 he contracted with Madame de Condorcet a liaison which lasted till her death (1822). It was said of him at the time that he gave up all his energies to love, friendship and learning. The salon of Madame de Condorcet was throughout the Consulate and the first Empire a rallying point for the dissident republicans. Fauriel was introduced by Madame de Staël to the literary circle of Auteuil, which gathered round Destutt de Tracy. Those who enjoyed his closest intimacy were the physiologist Cabanis (Madame de Condorcet’s brother-in-law), the poet Manzonii, the publicist Benjamin Constant, and Guizot. Later Tracy introduced him to Aug. Thierry (1821) and perhaps Thiers and Mignet. During his connexion with Auteuil, Fauriel’s attention was naturally turned to philosophy, and for some years he was engaged on a history of Stoicism, which was never completed, all the papers connected with it having accidentally perished in 1814. He also studied Arabic, Sanskrit and the old South French dialects. He published in 1810 a translation of the Parthenais of the Danish poet Baggesen, with a preface on the various kinds of poetry; in 1823 translations of two tragedies of Manzonii, with a preface “Sur la théorie de l’art dramatique”; and in 1824—1825 his translation of the popular songs of modern Greece, with a “Discours préliminaire” on popular poetry.

The Revolution of July, which put his friends in power, opened to him the career of higher education. In 1816 he became professor of foreign literature at the Sorbonne. The Histoire de la Gaule méridionale sous la domination des conquérants germanes (4 vols., 1836) was the only completed section of a general history of southern Gaul which he had projected. In 1836 he was elected a member of the Academy of Inscriptions, and in 1837 he published (with an introduction the conclusions of which would not now all be endorsed) a translation of a Provençal poem on the Albigensian war. He died on the 15th of July 1844. After his death his friend Mary Clarke (afterwards Madame J. Müh) published his Histoire de la littérature provençale (3 vols., 1846)—his lectures for 1831—1832. Fauriel was biased in this work by his preconceived and somewhat fanciful theory that Provence was the cradle of the chansons de geste and even of the Round Table romances; but he gave a great stimulus to the scientific study of Old French and Provençal. Dante et les origines de la langue et de la littérature italiennes (2 vols.) was published in 1854.

Fauriel’s Mémoires, found with Condorcet’s papers, are in the Institute library. They were written at latest in 1803, and include some interesting fragments on the close of the consulate. Mureau, &c. though anonymous, Lalanne, who published them (Les Derniers Jours du Consulat, 1866), proved them to be in the same handwriting as Fauriel’s. Further biographical notices of Fauriel’s career were published by Fouche’s successor (1840), and by the same hand. Another correspondence, catalogued by Ad. Régnier (1900). Benjamin Constant’s letters (1802—1823) were published by Victor Glachat in 1905. For Fauriel’s correspondence with Guizot see Nouvelle Rev. (Dec. 1, 1837, by V. Glachat); and for his letters to Miss Clark (1822—1844) the Revue des deux mondes (1908—1909) by E. Rod. See further Sainte-Beuve, Portraits contemporains, ii.; Antoine Guillois, Le Salon de Mme de Staël (1833) and La Morpquisse de Condorcet (1876); O’Meira, Une Salon à Paris: Mme Moth (undated); and J. B. Galley, Claude Fauriel (1900).

FAUST, or FAUSTUS, the name of a magician and charlatan of the 16th century, famous in legend and in literature. The historical Faust forms little more than the nucleus round which a great mass of legendary and imaginative material gradually accumulated. That such a person existed there is, however, sufficient proof.1 He first mentioned in a letter, dated August 20, 1507, of the learned Benedicent Johann Trithemius or Trittieus (1462—1516), abbot of Spanheim, to the mathematician and astrologer Johann Windung, at Hassfurt, who had apparently written about him. Trithemius, himself reputed a magician, and the author of a mystical work (published at Darmstadt in 1621 under the title of Steganographica and burnt by order of the Spanish Inquisition), speaks contemptuously of Faust, who called himself Magister Georgius Sabellius Faustus Junior, as a fool rather than a philosopher (futum non philosophum), a vain babbler, vagabond and mountebank who ought to be whipped, and who had fled from the city rather than confront him. The insane conceit of the man was proved by his boast that, were all the works of Aristotle and Plato blotted from the memory of men, he could restore them with greater elegance, and that Christ’s miracles were nothing to marvel at, since he could do the like whenever and as often as he pleased; his debased character by the fact that he had been forced to flee from the school of which he had been appointed master by the discovery of his unnatural crimes. The same unflattering estimate is contained in the second extant notice of Faust, in a letter of the jurist and canon Conrad Mudt (Mutianus Rufus), of the 3rd of October 1513, to Heinrich Urbanus. Mudt, like Trithemius, simply regards Faust as a charlatan. Similar is the judgment of another contemporary, Philipp Begardi, who in the fourth chapter of his Index sanitatis (Worms, 1559) ranks Faust, with other charlatans, among the “wicked, cheating, useless and unlearned doctors.”

It was Johann Gans (d. 1527), a worthy Protestant pastor of Basel, who like Mudt claims to have come into personal contact with Faust, who in his Sermones convivales (Basel, 1543) first credited the magician with genuine supernatural qualities. Gans, a man of some learning and much superstition, believed Faust to be in league with the devil, by whom about 1525 he was ultimately carried off, and declared the performing horse and dog by which the necromancer was accompanied to be familiar and evil spirits. Further information was given to the world by Johann Mannel or Manlius (d. 1560), councillor and historian to the emperor Maximilian II., in his Locorum communium collectanea (Basel, undated). Manlius reports a conversation of Melanchthon, which there is no reason to suspect of being other than genuine, in which the Reformer speaks of Faust as “a disgraceful beast and sewer of many devils,” as having been born at Kundling (Kundlingen or Knittlingen), a little town near his own native town (of Bietten), and as having studied magic at Cracow. The rest of the information given can hardly be regarded as historical, though Melanchthon, who like Luther,

¹ The opinion, long maintained by some, that he was identical with Johann Faust, the printer, is now universally rejected.
was no whit less superstitious than most people of his time, evidently believed it to be so. According to him, among other marvels, Faust was killed by the devil wringing his neck. While he lived he had taken about with him a dog, which was really a devil. A similar opinion would seem to have been held of Faust by Luther also, who in Widmann's Faust-book is mentioned as having declared that, by God's help, he had been able to ward off the evils which Faust with his sorceries had sought to put upon him. The passage, with the omission of Faust's name, occurs word for word in Luther's Table-talk (ed. C. E. Förstemann, vol. i. p. 50). It is not improbable, then, that Widmann, in supplying the name of the necromancer omitted in the Table-talk, may be giving a fuller account of the conversations between Faust and Bullinger, as his Théâtreum de beneficis (Frankf., 1569) mentions Faust as one of those "of whom the Scriptures speak, in various places, calling them magi." Lastly Johann Weiher, Wirius or Piscianarius (1512–1588)—a pupil of Cornelius Agrippa, body physician to the duke of Cleves and a man of enlightenment, who opposed the persecution of witches—in his De praestigiiis daemonum (Bazel, 1563, &c.), speaks of Faust as a drunken vagabond who had studied magic at Cracow, and before 1540 had practised "this beautiful art shamelessly up and down Germany, with unspeakable deceit, many lies and great effect." He goes on to tell how the magus, who had revenged himself on an unhappy parish priest, who had refused to supply him any longer with drink, by giving him a defilatory which removed not only the beard but the skin, and further, how he had insulted a poor wretch, for no better reason than that he had a black beard, by greeting him as his cousin the devil. Of his supernatural powers Weiher evidently believes nothing, but he tells the tale of his being found dead with his neck wrung, after the whole house had been shaken by a terrific din.

The sources above mentioned, which were but the first of numerous works on Faust, of more or less value, appearing throughout the next two centuries, give a sufficient picture of the man as he appeared to his contemp. They have their wandering charlatan who lived by his wits, chef-d'oeuvre, harlequin, alchemist, diviner, spiritualist medium, alchemist, or, to the more Credulous, a necromancer whose supernatural gifts were the outcome of a soul pact with the enemy of mankind. Whatever his character, his efforts to secure a widespread notoriety had, by the time of his death, certainly succeeded. By the latter part of the 16th century he had become the necromancer par excellence, and all that legend had to tell about the great wizards of the middle ages, Virgil, Pope Silvester, Roger Bacon, Michael Scot, or the mythic Klingsoor, had become for ever associated with his name. When in 1789, the oldest Faust-book was published, the Faust legend was, in all essential particulars, already complete.

The origin of the main elements of the legend must be sought far back in the middle ages and beyond. The idea of a compact with the devil, for the purpose of obtaining superhuman power or knowledge, is of Jewish origin, dating from the centuries immediately before and after the Christian era which produced the Talmud, the Kabalah and such magical books as that of Enoch. In the mystical rites—in which blood, as the seat of life, played a great part—that accompanied the incantations with which the Jewish magicians evoked the Satanim—the lowest grade of those elementals spirits (shamen) who have their existence beyond the dimensions of time and space—we have the prototypes and originals of all the ceremonies which occupy the books of magic down to the various versions of the Hecateenwong ascribed to Faust. The other principle underlying the Faust legend, the belief in the essentially evil character of purely human learning, has existed ever since the triumph of Christianity set divine revelation above human science. The legend of Theophilus—a Cilician archdeacon of the 6th century, who sold his soul to Satan for no better reason than to clear himself of a false charge brought against him by his bishop—was immensely popular throughout the middle ages, and in the 8th century formed the theme of a poem in Latin hexameters by the nun Hroswhita of Ganderseim, who, especially in her description of the ritual of Satan's court, displays a sufficiently lively and original imagination. Equally widespread were the legends with which gathered round the great name of Gerbert (Pope Silvester II.). Gerbert's vast erudition, like Roger Bacon's, so far in advance of his age, naturally cast upon him the suspicion of traffic with the infernal powers; and in due course the suspicion developed into the tale, embellished with circumstantial and harrowing details, of a compact with the arch-fiend, by which the scholar had obtained the summit of earthly ambition at the cost of his immortal soul. These are but the two most notable of many similar stories; and, in an age when the belief in witchcraft and the ubiquitous activity of devils was still universal, it is natural that they should have been retold in all good faith by the most notorious wizard who was himself at no pains to deny their essential truth. The Faust legend, however, owes something of its peculiar significance also to the special conditions of the age which gave it birth: the age of the Renaissance and the Reformation. The opinion that the religious reformers were the champions of liberty of thought against the obscurantism of Rome is the outgrowth of later experience. To themselves they were the protagonists of "the pure Word of God" against the corruptions of a church defiled by the world and the devil, and the sceptical spirit of Italian humanism was as abhorrent to them as to the Catholic reactionaries by whom it was again trampled under foot. If then, in Goethe's drama, Faust ultimately develops into the type of the unsatisfied yearning of the human intellect for "more than earthly meat and drink," this was because the great German humanist deliberately infused into the old story a spirit absolutely opposed to that by which it had originally been inspired. The Faust of the early Faust-books, of the ballads, the dramas and the puppet-plays innumerable which grew out of them, is irrevocably damned because he deliberately prefers human to "divine" knowledge; "he laid the Holy Scriptures behind the door and under the bench, refused to be called doctor of Theology, but preferred to be 'styd' doctor of Medicine." The orthodox moral of the earliest versions is preserved to the last in the puppet-play: "Next day when he had insulted a poor wench, for no better reason than that he had a black beard, by greeting her as his cousin the devil, the Voice of the left answers: 'Faust! Faust! leave the study of Theology. Betake you to Necromancy, and you will be the happiest of mortals.'" The Voice to the right cries: "Faust! Faust! desist from this proposal! Go on with the study of Theology, and you will be the happiest of mortals." TheVoice to the left answers: "Faust! Faust! leave the study of Theology." It was doubtless this orthodox and Protestant character of the Faust story which contributed to its immense and immediate popularity in the Protestant countries. The first edition of the Historia von D. Johann Fausten, by an unknown compiler, published by Johann Spies at Frankfurt in 1587, sold out at once. Though only placed on the market in the autumn, before the year was out it had been reprinted in four pirated editions. In 1591 a second edition was published. Then, in 1599, a second edition was published by Spies at Frankfurt and a version in low German by J. J. Balhorn at Lubeck. Reprints and amended versions continued to appear in Germany every year, till they culminated in the pedantic compilation of Georg Rudolf Widmann, who obscured the dramatic interest of the story by an excessive display of erudition and by his well-meaning efforts to elaborate the orthodox moral. Widmann's version of 1599 formed the basis of that of Johann Nicolaus Pitzer, published at Nuremberg in 1674, which passed through six editions, the last appearing in 1726. Like Widmann, Pitzer was more zealous for imparting information than for perfecting a work of art, though he had the good taste to restore the episodes of the evocation of Helen, which Widmann had expunged as unfit for Christian readers. Lastly there appeared, about

1 Many are given in Kiesewetter's Faust, p. 112, &c.
1713, what was to prove the most popular of all the Faust-books: The League with the Devil established by the world-famous Arch-
necromancer and Wizard Dr Johann Faust. By a Christian
Believer (Christiick Meynenden). This version, which bore
the obviously false date of 1525, passed through many editions,
and was circulated at all the fairs in Germany. About the
success of the story was scarcely striking. A Danish version
appeared in 1588; in England the History of the Damnable Life
and Detested Death of Dr John Faustus was published some
time between 1588 and 1594: in France the translation of
Victor Palma Cayet was published at Paris in 1592 and, in
the course of the next two hundred years, went through fifteen
editions; the oldest Dutch and Flemish versions are dated
1592; and in 1612 a Czech translation was published at Prague.

Besides the popular histories of Faust, all more or less founded
on the original edition of Spies, numerous ballads on the same
subject were also soon in circulation. Of these the most interest-
ning for the English reader is A Ballad of the life and death of Dr
Faustus the great conger, published in 1588 with the imprimatur
of the learned Aylimer, bishop of London. This ballad is supposed
to have preceded the English version of Spies's Faust-book,
mentioned above, on which Marlowe's drama was founded.

To Christopher Marlowe, it would appear, belongs the honour
of first realizing the great dramatic possibilities of the Faust
legend. The Tragical History of D. Faustus as it hath bene
acted by the Right Honourable the Earl of Nottingham his servants
was first published by Thomas Bushell at London in 1604. As
Marlowe died in 1593, the play must have been written shortly
after the appearance of the English version of the Faust story
on which it was based. The first recorded performance was on
the 30th of September 1594.

As Marlowe's Faustus is the first, so it is incomparably the
finest of the Faust dramas which preceded Goethe's masterpiece.
Like most of Marlowe's work it is, indeed, very unequal. At
certain moments the poet seems to realize the great possibilities
of the story, only to sacrifice them to the necessity for humouring
the prevailing public taste of the age. Faustus, who in one
scene turns disillusioned from the ordinary fountains of know-
ledge, or flies in a dragon-drawn chariot through the Empyrean
to search out the mysteries of the heavens, in another is made
to use his superhuman powers to satisfy the taste of the ground-
lings for senseless buffoonery, to windle a horse-dealer, or cheat
an ale-wife of her score; while Protestant orthodoxy is concili-
ated by irrelevant insults to the Roman Church and by the final
catastrophe, when Faustus pays for his revolt against the Word
of God by the forfeit of his soul. This conception, which followed
that of the popular Faust histories, underlay all further develop-
ments of the Faust drama for nearly two hundred years. Of
the serious stage plays founded on this theme, Marlowe's Faustus
remains the solitary artistic example near the end of the 18th century; but there is plenty of evidence to prove that in
Germany the Comedy of Dr Faust, in one form or another,
was and continued to be a popular item in the repertoires of
theatrical companies until far into the 18th century. It is
supposed, with good reason, that the German versions were
based on those introduced into the country by English strolling
players early in the 17th century. However this may be, the
dramatic versions of the Faust legend followed much the same
course as the prose histories. Just as these gradually degener-
ated into chap-books hawked at fairs, so the dramas were replaced
by puppet-plays, handed down by tradition through genera-
tions of showmen, retaining their original broad characteristics
but subject to infinite modification in detail. In this way, in
the puppet-shows, the traditional Faust story retained its popular-
ity until far into the 19th century, long after, in the sphere of
literature, Goethe had for ever raised it to quite another plane.

It was natural that during the literary revival in Germany in
the 18th century, when German writers were eagerly on the
look-out for subjects to form the material of a truly national
literature, the Faust legend should have attracted their attention.
Lessing was the first to point out its great possibilities;\(^1\) and
he himself wrote a Faust drama, of which unfortunately only a
fragment remains, the MS. of the completed work having been
lost in the author's lifetime. None the less, to Lessing, not to
Goethe, is due the new point of view from which the story was
approached by most of those who, after about the year 1770,
attempted to tell it. The traditional Faust legend represented
the sternly orthodox attitude of the Protestant reformers. Even
the mitigating elements which the middle ages had per-
mitted had been banished by the stern logic of the theologians
of the New Religion. Theophilus had been saved in the end
by the intervention of the Blessed Virgin; Pope Silvester, according
to one version of the legend, had likewise been snatched from
the jaws of hell at the last moment. Faust was irrevocably
damned, since the attractions of the studium theologicum
proved insufficient to counteract the fascinations of the classic
Helen. But if he was to become, in the 18th century, the type
of the human intellect face to face with the deep problems of
human life, it was intolerable that his struggles should issue
in eternal reprobation. Error and heresy had ceased to be
regarded as crimes; and stereotyped orthodoxy, to the age of
the Encyclopaedists, represented nothing more than the atrophy
of the human intellect. Es irt der Mensch so lang er strebt,
which sums up in one pregnant line the spirit of Goethe's Faust,
sums up also the spirit of the age which killed with ridicule
the last efforts of persecuting piety, and saw the birth of modern
science. Lessing, in short, proclaimed that the final end of
Faust must be, not his damnation, but his salvation. This revolution-
ary conception is the measure of Goethe's debt to Lessing.
The essential change in Goethe himself introduced into the
story is in the nature of the pact between Faust and Mephisto-
opheles, and in the character of Mephistopheles himself.
The Mephistopheles of Marlowe, as of the old Faust-books, for
all his brave buffoonery, is a melancholy devil, with a soul above
the unsavoury hell in which he is forced to pass a hopeless
existence. "Tell me," says Faust, in the puppet-play, to
Mephistopheles, "what would you if you could attain to
everlasting salvation?" And the devil answers, "Hear and
despair! Were I able to attain everlasting salvation, I would
mount to heaven on a ladder, though every rung were a razor
edge." Goethe's Mephistopheles would have made no such
reply. There is nothing of the fallen angel about him; he is
perfectly content with his past, his present and his future;
and he appears before the throne of God with the same easy
insolence as he exhibits in Dame Martha's back-garden. He
is, in fact, according to his own definition, the Spirit of Denial,
the impersonation of that utter scepticism which can see no
distinction between high and low, between good and bad, and
is therefore without aspiration because it knows no " divine
discontent." And the compact which Faust makes with this
spirit is from the first doomed to be worthless. Faustus had barred
the way to his soul for a definite period of pleasure and power.
The conception that underlies the compact of Faust with Mephisto-
opheles is far more subtle. He had sought happiness vainly
in the higher intellectual and spiritual pursuits; he is content
to seek it on a lower plane since Mephistopheles gives him the
chance; but he is confident that nothing that "such a poor
devil" can offer him could give him that moment of supreme
satisfaction for which he craves. He goes through the traditional
mummery of signing the bond with scornful submission; for
he knows that his damnation will not be the outcome of any
formal compact, but will follow inevitably, and only then, when
his soul has been grown to be satisfied with what Mephistopheles can
p curry him.

\(^1\) Canst thou with lying flattery rule me
Until self-pleased myself I see,
Canst thou with pleasure mock and fool me,
Let that hour be the last.
When thus I hail the moment flying:

1. "Ah, still delay, thou art so fair!"
Then bind me in thy chains undoing.
My final ruin then declare!"

It is because Mephistopheles fails to give him this self-satisfaction
\(^2\) Bayard Taylor's trans.
or to absorb his being in the pleasures he provides, that the compact comes to nothing. When, at last, Faust cries to the passing moment to remain, it is because he has forgotten self in enthusiasm for a great and to redeem work, in a state of mind the very antithesis of all that Mephistopheles represents. In the old Faust-books, Faust had been given plenty of opportunity for repentance, but the inducements had been no higher than the exhibition of a throne in heaven on the one hand and the tortures of hell on the other. Goethe's Faust, for all its Christian setting, departs widely from this orthodox standpoint. Faust shows no signs of "repentance"; he simply emerges by the innate force of his character from a lower into a higher state. The triumph, foretold by the "Lord" in the opening scene, was inevitable from the first, sin though it was, "not so long as he is living.

A good man through obscurest aspiration
Is ever conscious of the true way.

A man, in short, must be judged not by the sins and follies which may be but accidents of his career, but by the character which is its essential outcome.

This idea, which inspired also the kindred theme of Browning's Paracelsus, is the main development introduced by Goethe into the Faust legend. The episode of Gretchen, like the story of Mephistopheles, was dropped at all; and it is difficult to deny the pertinency of Charles Lamb's criticism, "What has Margaret to do with Faust?" Yet in spite of all that may be said of the irrelevances, and of the discussions of themes of merely ephemeral interest, with which Goethe overloaded especially the second part of the poem, his Faust remains for the modern world the final form of the legend out of which it grew, the magnificent expression of the broad humanism which, even in spheres accounted orthodox, has tended to replace the peculiar studium theologicum which inspired the early Faust-books.

See Karl Engel, Zusammenstellung der Faust-Schriften vom 16. Jahrhundert bis Mitte 1832—a second edition of the Bibliotheca Faustina (1874)—(Oldenburg, 1885), a complete bibliography of all published and, it is thought, all written by or concerning Faust; Goethe's Faust, with introduction and notes by K. J. Schröer (2nd ed., Heilbronn, 1886); Carl Kiesewetter, Faust in der Geschichte und Tradition (Leipzig, 1893). The last book, besides being a critical study of the material for the historical and legendary story of Faust, aims at estimating the relation of the Faust-legend to the whole subject of occultism, ancient and modern. It is a mine of information on necromancy and its kindred subjects, as well as on eminent theurgists, wizards, crystal-gazers, and the like, of all ages.

FAUSTINA, ANNA GALERIA, the younger, daughter of Antoninus Pius, and wife of Marcus Aurelius Antoninus. She is accused by Dio Cassius and Capitolinus of gross profligacy, and was reputed to have instigated the revolt of Avidius Cassius against her husband. She died in 175 or 176 (so Clinton, Fasti rom.) at Halais, near Milton-on-Ouse, in Sussex, where she and Faustus had accompanied Avidius. Charitable schools for orphan girls (hence called Faustinianæ) were founded in her honour, like those established by her father Antoninus in honour of his wife, the elder Faustina. Her statue was placed in the temple of Venus, and she was numbered among the tutelary deities of Rome. From the fact that Aurelius was always devoted to her and was heartbroken at her death, it has been inferred that the unfavourable estimate of the historians is prejudiced or at least mistaken.

Suetonius and Capitolinus related that Avidius Cassius, who accompanied Faustus bxx. 22, liv. 3; E. Renan, in Mélanges d'histoire et des voyages, 169-195.

PAVARA, a town of Sicily, in the province of Girgenti, 5 m. E. of Girgenti by road. Pop. (1901) 20,398. It possesses a fine castle of the Chiaramonte family, erected in 1280. The town has a considerable agricultural trade, and there are sulphur and other mines in the neighbourhood.

FAVART, CHARLES SIMON (1710-1738), French dramatist, was born in Paris on the 13th of November 1710, the son of a pastry-cook, named Jean-François Favart, an innkeeper of Louis-le-Grand, and after his father's death carried on the business for a time. His first success in literature was La France délivrée par la Pacelle d'Orléans, a poem which obtained a prize of the Académie des Jeux Florux. After the production of his first vaudeville, Les Deux Jumelles (1734), circumstances enabled him to relinquish business and devote himself entirely to the drama. He provided many pieces anonymously for the lesser theatres, and first put his name to La Chercelle d'espér, which was produced in 1741. Among his most successful works were Annette et Lubin, Le Coy du village (1743), Ninette à la cour (1753), Les Trois Sultanes (1761) and L'Anglais à Bordeaux (1763). Favart became director of the Opéra Comique, and in 1745 married MARIE JUSTINE BENOÎTE DURONCEAUV (1727-1772), a beautiful young dancer, singer and actress, who as "Mlle Chantilly" had made a successful début the year before. By their united talents and labours the Opéra Comique rose to such a height of success that it aroused the jealousy of the rival Comédie Italienne and was suppressed. Favart, left thus without resources, accepted the proposal of Mme de Saxe, and undertook the direction of a troupe of comedians which was to accompany his army into Flanders. It was part of his duty to compose from time to time impromptu verses on the events of the campaign, amusing and stimulating the spirits of the men. So popular were Favart and his troupe that the enemy became desirous of hearing his company and sharing his services, and permission was given to gratify them, battles and comedies thus curiously alternating with each other. But the marshal, who was an admirer of Mme Favart, began to persecute her with his attentions. To escape him she went to Paris, and the story of the break with her husband, which was issued against him, but he fled to Strassburg and found concealment in a celler. Mme Favart meanwhile had established the marshal in a house at Vaugirard; but as she proved a tickle mistress she was suddenly arrested and confined in a convent, where she was brought to unconditional surrender in the beginning of 1750. Before the year was out the marshal died, and Mme Favart reappeared at the Comédie Italienne, where for twenty years she was the favourite actress. To her is largely due the beginnings of the change in this theatre to performances of a lyric type adapted from Italian models, which developed later into the genuine French comic opera. She was also a bold reformer in matters of stage costume, playing the peasant with bare arms, in wooden shoes and linen dress, and not, as heretofore, in court costume with enormous hoops, diamonds and long white kid gloves. With her husband, and other authors, she collaborated in a number of successful pieces, and one—La Fille mal gardée—she produced alone.

Favart survived his wife twenty years. After the marshal's death in 1750 he had returned to Paris, and resumed his pursuits as a dramatist. It was at this time that the abbé de Voisenon became intimate with him and took him into his laboratory, which was unknown. He had grown nearly blind in his last days, and died in Paris on the 12th of May 1792. His plays have been several times republished in various editions and selections (1765-1772, 12 vols.; 1810, 3 vols.; 1813-1853). His correspondence (1759-1763) with Count Durazzo, director of theatres at Vienna, was published in 1808 as Mémoires et correspondance littéraire, dramatique et anecdotique de C. S. Favart. It furnishes valuable information on the state of the literary and theatrical worlds in the 18th century.

Favart's second son, CHARLES NICOLAS JOSEPH JUSTIN FAVART (1740-1808) was an Italian of moderate talent at the Comédie Francaise for fifteen years. He wrote a number of successful plays—Le Diable boitais (1782), Le Mariage singulier (1787) and, with his father, La Vieillisse d'Annette (1791). His son Antoine Pierre Charles Favart (1780-1867) was in the diplomatic service, and assisted in editing his grandfather's memoirs; he was a playwright and painter as well.

FAVERSHAM, a market town and river-port, member of the Cinque Port of Dover, and municipal borough in the Faversham parliamentary division of Kent, England, on a creek of the Swale, 9 m. W.N.W. of Canterbury on the South-Eastern & Chatham railway. Pop. (1901) 11,290. The church of St Mary of Charity, restored by Sir G. G. Scott in 1874, is of Early English architecture, and has some remains on one of the columns of frescoes of the same period, while the 14th-century paintings in the chancel are in better preservation. Some of the brasses are very fine, and there is one commemorating King Stephen, as well as
FAVORINUS—FAVRE

a tomb said to be his. He was buried at the abbey he founded here, of which only a wall and the foundations below ground remain. At Davington, close to Faversham, there are remains, incorporated in a residence, of the cloisters and other parts of a Benedictine priory founded in 1153. Faversham has a free grammar school founded in 1527 and removed to its present site in 1877. Faversham Creek is navigable up to the town for vessels of 200 tons. The shipping trade is considerable, chiefly in coal, timber and agricultural produce. The oyster fisheries are important, and are managed by a very ancient guild, the Company of Free Dredgers of the Hundred and Manor of Faversham. The marketing and the manufacture of cement are also carried on, and there are several large powder mills in the vicinity. The town is governed by a mayor, 4 aldermen and 12 councillors. Area, 686 acres.

There was a Roman-British village on the site of Faversham. The town (Faversfield, Faveresham) owed its early importance to its situation as a port on the Swale, to the fertile country surrounding it, and to the neighbourhood of Watling Street. In S1 it was called the king's town, and a witenagemot was held here under Æthelstan. In 1086 it was assessed as royal demesne, and in 1235 it was held at that date. An abbey was built by Stephen III in 1147, in which he and Matilda were buried. They had endowed it with the manor and hundred of Faversham; this grant caused many disputes between the abbott and men of Faversham concerning the abbott’s jurisdiction. Faversham was probably a member of Dover from the earliest association of the Cinque Ports, certainly as early as Henry III., who in 1252 granted among other liberties of the Cinque Ports that the barons of Faversham should plead only in Shepway Court, but ten years later transferred certain pleas to the abbott’s court. In this reign also the abbott appointed the mayor, but from the reign of Edward I. he was elected by the freemen and then installed by the abbott. The corporation was prescriptive, and a hallmote held in 1293 was attended by a mayor and twelve jurats. All the liberties of the Cinque Ports were granted to the barons of Faversham by Edward I. in 1302, and confirmed by Edward III. in 1356, and by later monarchs. The governing charter till 1835 was that of Henry VIII., granted in 1545 and confirmed by Edward VI.

FAVORINUS (2nd century A.D.), Greek scholar and philosopher, flourished during the reign of Hadrian. A Gaul by birth, he was a native of Arelate (Arles), but at an early age began his lifelong travels in France, Italy and the East. His extensive knowledge, combined with great oratorical powers, raised him to eminence both in Athens and in Rome. With Plutarch, who dedicated to him his treatise Περὶ τῶν πρῶτων γοργών, with Herodes Atticus, to whom he bequeathed his library at Rome, with Demetrius the Cynic, Cornelius Fronto, Aulus Gallus, and with Hadrian himself, to whom he lived on intimate terms; his great rival, whom he violently attacked in his later years, was Polemon of Smyrna. It was Favorinus who, on being silenced by Hadrian in an argument in which the sophist might easily have refuted his adversary, subsequently explained that it was foolish to criticize the logoi of the master of thirty legions. When the servile Athenians, feigning to share the emperor’s displeasure with the sophist, pulled down a statue which they had erected to him, Favorinus remarked that if only Socrates also had had a statue at Athens, he might have been spared the hemlock. Of the very numerous works of Favorinus, we possess only a few fragments (unless the Καρυπαθάς λόγοι attributed to his tutor Dio Chrysostom is by him), preserved by Aulus Gallus, Diogenes Laërtius, Philostratus, and Suidas, the second of whom borrows from his Παρά τοῦ ἱστορία (miscellaneous history) and his Αἰσχρομναία (memoriae). As a philosopher, Favorinus belonged to the sceptical school; his most important work in this connexion appears to have been Περί τῶν πρῶτων (the Pyrrhonean Tropes) in ten books, in which he endeavours to show that the methods of Pyrrho were useful to those who intended to practise in the law courts.

See Philostratus, Vitae sophistarum, i. 8; Suidas, s. v. frags. in C. W. Müller, Frag. Hist. Graec. iii. 4; monographs by L. Legré (1899), T. Colaradeau (1903).

FAVRES, THOMAS DE MARY, MARQUIS DE (1744–1790), French royalist, was born on the 26th of March 1744, at Blois. He belonged to a poor family whose nobility dated from the 12th century. At seventeen he was a captain of dragoons, and saw some service in the closing campaign of the Seven Years’ War. In 1772 he became first lieutenant of the Swiss guards of the count of Provence (afterwards Louis XVIII). Unable to meet the expenses of his rank, which was equivalent to the grade of colonel in the army, he retired in 1775. He married in 1776 Victoria Hedwig Caroline, princess of Anhalt-Bernburg-Schaumburg, whose mother, deserted by her husband Prince Charles Louis, lived with her daughter Ludovica in the house of Marshal Soubise. After his marriage he went to Vienna to press the restitution of his wife's rights, and spent some time in Warsaw. In 1785 he was authorized to raise a patriotic legion to help the Dutch against the statholder William IV. and his Prussian allies. Returning to Paris at the outbreak of the Revolution, he became implicated in schemes for the escape of Louis XVI. from Paris and the dominance of the National Assembly. He was commissioned by the count of Provence through one of his gentlemen, the comte de la Châtre, to negotiate a loan of two million francs from the bankers Schaufel and Sarcourt. Favores was arrested by certain officers by whom he was betrayed; and, with his wife, he was arrested on Christmas Eve 1789 and imprisoned in the Abbaye. A fortnight later they were separated, Favras being removed to the Châtelet. It was stated in a leaflet circulated throughout Paris that Favras had organized a plot of which the count of Provence was the moving spirit. A force of 30,000 was to be raised, La Fayette and Bailly, the mayor of Paris, were to be assassinated, and Paris was to be starved into submission by cutting off supplies. The count hastened publicly to the bar of the Abbaye to denounce Favras by name, and a letter to the National Assembly, although there is no reasonable doubt of his complicity in the plot that did exist. In the course of a trial of nearly two months' duration the witnesses disagreed, and even the editor of the Résolutions de Paris (No. 30) admitted that the evidence was insufficient; but an armed attempt of the Royalists on the Châtelet on the 26th of January, which was defeated by La Fayette, roused the suspicious temper of the Parisians to fury, and on the 18th of February 1790, in spite of the courageous defence of his counsel, Favras was condemned to be hanged. He refused to give any information of the alleged plot, and the sentence was carried out on the Place de Grève the next day, to the delight of the populace, since it was the first instance when no distinction in the mode of execution was allowed between noble and commoner. Favras was generally regarded as a martyr to his refusal to implicate the count of Provence, and Madame de Favras was pensioned by Louis XVI. She left France, and her son Charles de Favras served in the Austrian and the Russian armies. He received an allowance from Louis XVIII. Her daughter Caroline married Rüdiger, Freiherr von Stillfried Ratén, in 1805.

The official dossier of Favras's trial for high treason against the nation disappeared from the Châtelet, but its substance is preserved in the papers of a clerk.

Bibliography.—For particulars see A. Tuetey, Répertoire général des sources manuscrites de l'histoire de Paris pendant la Révolution française (vol. i. 1860, pp. 175-177); M. Tourneux, Bibl. de l'histoire de Paris pendant la Révolution française (vol. i. pp. 196-198, 1890). His brother, M. Mahy de Cormère, published a Mémorial justificatif in 1790 and a Justification in 1791. See also a memoir by Eduard, Freiherr v. Stillfried Ratén (Vienna, 1881), and an article by Alexis de Valon in the Revue des deux mondes (15th June 1851).

FAVRE, JEAN ALPHONSE (1815–1890), Swiss geologist, was born at Geneva on the 31st of March 1815. He was for many years professor of geology in the academy at Geneva, and afterwards president of the Federal Commission with charge of the geological map of Switzerland. The bulk of his earliest papers were on the Anthracite beds of the Alps (1841), and later he gave special attention to the geology of Savoy and of Mont Blanc, and to the ancient glacial phenomena of those Alpine regions. His elucidation of the geological structure demonstrated that
certain anomalous occurrences of fossils were due to repeated interfoldings of the strata and to complicated overthrust faults.

In 1867 he published *Recherches géologiques dans les parties de la Savoie, du Piémont et de la Suisse voisines du Mont Blanc*. He died at Geneva in June 1890.

His son Ernest Favre (b. 1845) has written on the palaeontology and geology of Galicia, Savoy and the Fribourg Alps, and of the Caucasus and Crimea.

Favre, Jules Claude Gabriel (1809–1889), French statesman, was born at Lyons on the 21st of March 1809, and began his career as an advocate. From the time of the revolution of 1830 he openly declared himself a republican, and in political trials he seized the opportunity to express his opinions. After the revolution of 1848 he was elected deputy for Lyons to the Constituent Assembly, where he sat among the moderate republicans, voting against the socialists. When Louis Napoleon was elected President of France, Favre made himself conspicuous by his opposition, and on the 2nd of December 1851 he tried with Victor Hugo and others to organize an armed resistance in the streets of Paris. After the coup d'état he withdrew from politics, resumed his profession, and distinguished himself by his defence of Felice Orsini, the perpetrator of the attack against the life of Napoleon III. In 1858 he was elected deputy for Paris, and was made a senator by the fall of Mme. de Robespierre, the action of which he approved. In 1860 he was elected a deputy for the department of the Seine, and delivered a number of addresses denouncing the Mexican expedition and the occupation of Rome. These addresses, eloquent, clear and incisive, won him a seat in the French Academy in 1867. With Thiers he opposed the declaration of war against Prussia in 1870, and at the news of the defeat of Napoleon III. at Sedan he demanded from the Legislative Assembly the deposition of the emperor. In the government of National Defence he became vice-president under General Trochu, and minister of foreign affairs, with the onerous task of negotiating with Germany, from which France was then cut off by Bismarck's policy. In 1871 he was elected deputy for the department of the Seine, and removed from the ministry of foreign affairs to that of the Interior. His speech of 28th of May 1871, denouncing the atrocity of the Prussian administration, during the siege of Paris, was broadcast in all the provinces of France, and has never been forgotten. He was continually in the chamber of deputies. Elected senator as a diplomat than he had been as an orator, and committed several irreparable blunders. His famous statement on the 6th of September 1870 that he "would not yield to Germany an inch of territory nor a single stone of the fortresses" was a piece of oratory which Bismarck met on the 19th by his declaration to Favre that the cession of Alsace and of Lorraine was the indispensable condition of peace. He also made the mistake of not having an assembly elected which would have more regular powers than the government of National Defence, and of opposing the removal of the government from Paris during the siege. In the peace negotiations he allowed Bismarck to get the better of him, and arranged for the armistice of the 28th of June 1871 without knowing the situation of the armies, and without consulting the government at Bordeaux. By a grave oversight he neglected to inform Gambetta that the army of the East (80,000 men) was not included in the armistice, and it was thus obliged to retreat to neutral territory. He gave no proof whatever of diplomatic skill in the negotiations for the treaty of Frankfort, and it was Bismarck who imposed all the conditions. He withdrew from the ministry, discredited, on the 2nd of August 1871, but remained in the chamber of deputies. Elected senator on the 30th of January 1876, he continued to support the government of the republic against the reactionary opposition, until his death on the 20th of January 1880.

Favus (Lat. for honeycomb), a disease of the scalp, but occurring occasionally on any part of the skin, and even at times on mucous membranes. The uncomplicated appearance is that of a yellowish, circular, cup-shaped crusts (scutula) grouped in patches like a piece of honeycomb, each about the size of a split pea, with a hair projecting in the centre. These increase in size and become crusted over, so that the characteristic lesion can only be seen round the edge of the scalp. Growth continues to take place for several months, when scab and scutulum come away, leaving a shining bare patch destitute of hair. The disease is essentially chronic, lasting from ten to twenty years. It is caused by the growth of a fungus, and pathologically is the reaction of the tissues to the growth. It was the first disease in which a fungus was discovered—by J. L. Schönlein in 1839; the discovery was published in a brief note of twenty lines in *Millers Archiv* for that year (p. 82), the fungus having been subsequently named by R. Remak *Schönleinii* after its discoverer. The achorion consists of slender, mycelial threads matting together, bearing oval, nucleated gonidia either free or joined. The spores would appear to enter through the unbroken cutaneous surface, and to germinate mostly in and around the hair-follicle and sometimes in the shaft of the hair. In 1892 two other species of the fungus were described by P. G. Unna and Frank, the *Favus griseus*, giving rise to greyish-yellow scutula, and the *Favus sulphureus celierii*, causing sulphur-yellow scutula of a rapid growth. Favus is commonest among the poorer Jews of Russia, Poland, Hungary, Galicia and the East, and among the Mohammedans of Turkish provinces, Persia, Egypt, Algiers, &c. It is not rare in the southern departments of France, in some parts of Italy, and in Scotland. It is spread by contagion, usually from cats, often, however, from mice, fowls or dogs. Lack of personal cleanliness is an almost necessary factor in its development, but any one in delicate health, especially if suffering from phthisis, seems especially liable to contract it. Before treatment can be begun the scabs must be removed by means of carbolized oil, and the head thoroughly cleansed with soft soap. The cure is then brought about by the judicious use of parasiticides. If the nails are affected, the solution will probably be needed before the disease can be reached.

Fawcett, Henry (1833–1884), English politician and economist, was born at Salisbury on the 25th of August 1833. His father, William Fawcett, a native of Kirkby Lonsdale, in Westmorland, started life as a draper's assistant at Salisbury, opened a draper's shop on his own account in the market-place there in 1825, married a solicitor's daughter of the city, became a prominent local man, took a farm, developed his north-country sporting instincts, and displayed his shrewdness by successful speculation in Yorkshire mining. His second son, Henry, inherited from his father a full measure of his shrewdness, along with his masculine energy, his straightforwardness, his perseverance and his fondness for fishing. The father was active in electioneering matters, and his wife was an ardent reformer. Henry Fawcett was educated locally and at King's College school, London, and proceeded to Peterhouse, Cambridge, in October 1852, migrating in 1853 to Trinity Hall. He was seventh wrangler in 1856, and was elected to a fellowship at his college.

He had already attained some prominence as an orator at the Cambridge Union. Before he left school he had formed the ambition of entering parliament, and, being a poor man, he resolved to approach the House of Commons through a career at the bar. He had already entered Lincoln's Inn. His prospects, however, were shattered by a calamity which befell him in September 1858, when two stray pellets from his father's fowling-piece passed through the glasses he was wearing and blinded him for life. Within ten minutes after his accident he had made up his mind "to stick to his old pursuits as much as possible." He kept up all recreations contributing to the enjoyment of life; he fished, rowed, skated, took abundant walking and horse exercise, and learnt to play cards with marked packs. Soon after his accident he established his headquarters at Trinity Hall, Cambridge, entered cordially into the social life of the college, and came to be regarded by many as a typical Cambridge man. He gave up mathematics (for which he had little aptitude), and specialized in political economy. He paid comparatively little attention to economic history, but he was in the main a
devout believer in economic theory, as represented by Ricardo and his school. The later philosophy of the subject he believed to be summed up in one book, Mill's Principles of Political Economy, which he regarded as indispensable. "Vox mecum" of every politician. He was not a great reader, and Mill probably never had a serious rival in his regard, though he was much impressed by Buckle's History of Civilization and Darwin's Origin of Species when they first appeared. He made a great impression in 1859 with a paper at the British Association, and he soon became a familiar figure there and at various lecture halls in the north as an exponent of orthodox economic theory.

Of the sincerity of his faith he gave the strongest evidence by his desire at all times to give a practical application to his views, and to be instrumental in enforcing them. Mill's disciples he was, no doubt, far inferior as an economic thinker to Cairnes, but as a popularizer of the system and a demonstrator of its principles by concrete examples he had no rival.

His power of exposition was illustrated in his Manual of Political Economy (1863), of which in twenty years as many as 20,000 copies were sold. Alexander Macmillan had suggested the book, and it appeared just in time to serve as a credential, when, in the autumn of 1863, Fawcett stood and was elected for the Chair of Political Economy at Cambridge. The appointment attached to it permanently to Cambridge, gave him an income, and showed him to be competent to discharge duties from which a blind man is often considered to be debarr'd. He was already a member of the Political Economy Club, and was becoming well known in political circles as an advanced Radical. In January 1863, after a spirited though abortive attempt in Southwark, he was only narrowly beaten for the borough of Cambridge. Early in 1864 he was adopted as one of the Liberal candidates at Brighton, and at the general election of 1865 he was elected by a large majority. Shortly after his election he became engaged to Millicent, daughter of Mr Newson Garrett of Aldbourne, Suffolks, and in 1865 he was married. Mrs Fawcett (b. 1847) became well known for her social and literary work, and especially as an advocate, in the press and on the platform, of women's suffrage and the higher education and independent employment of women. And after her husband's death, as well as during his lifetime, she was a prominent leader in these movements.

Fawcett entered parliament just in time to see the close of Palmerston's career and to hail the adoption by Gladstone of a programme of reform to which most of the laissez-faire economists gave assent. He was soon known as a forcible speaker, and quickly overcame his imputation as a man of academic and doctrinaire, though it is true that a certain monotony in delivery often gave a slightly too didactic tone to his discourses. But it was as the uncompromising critic of the political shifts and expedients of his leaders that he attracted most attention. He constantly insisted upon the right of exercising private judgment, and he especially devoted himself to the defence of causes which, as he thought, were neglected both by his official leaders and by his Radical comrades. Re-elected for Brighton to the parliament of 1866-1874, he greatly hampered the government by his persistent efforts to bring about the abolition of clerical fellowships and to reduce the payment of election expenses out of the rates, and by opposing the "permissive compulsion" clauses of the Elementary Education Bill, and the exclusion of agricultural children from the scope of the act. His hatred of weak concessions made him the terror of parliamentary wirepullers, and in 1871 he was not undeservedly spoken of in The Times as the most "thorough Radical now in the House." His liberal ideals were further shocked by the methods by which Gladstone achieved the abolition of Army Purchase. His disgust at the supineness of the cabinet in dealing with the problems of Indian finance and the growing evil of Commons Enclosures were added to the catalogue of grievances which Fawcett drew up in a powerful article, "On the Present Position of the Government," in the Fortnightly Review for November 1871. In 1867 he had opposed the expenses of a ball given to the sultan at the India office being charged upon the Indian budget. In 1870 he similarly opposed the taxation of the Indian revenue with the cost of presents distributed by the duke of Edinburgh in India. In 1871 he went alone into the lobby to vote against the dowry granted to the princess Louise. The soundness of his principles was not impeached, but his leaders looked askance at him, and from 1871 he was severely shunned by the government whips. Their suspicion was justified when in 1873 Fawcett took a leading share in opposing Gladstone's scheme for university education in Ireland as too denominational, and so contributed largely to a conclusive defeat of the Gladstone ministry.

From 1865 to 1880 Fawcett concentrated his energies upon two important subjects which had not hitherto been deemed worthy of the serious attention of the Radicals — the first of these was the preservation of commons, especially those in large towns; and the second was the responsibility of the British government for the amendment of Indian finance. In both cases the success which he obtained exhibited the sterling sense and shrewdness which made up such a great part of Fawcett's character. In the first case Fawcett's great triumph was the enforcement of the general principle that each annual Enclosure Act must be scrutinized by parliament and judged in the light of its conformity to the interests of the community at large.

Probably most of all more than he did to prevent the disafforestation of Epping Forest. At the same time he regularly attended the meetings of the Commons Preservation Society, and he remained to the end one of its staunchest supporters. His intervention in the matter of Indian finance, which gained him the sobriquet of the "member for India," led to no definite legislative achievements, but it called forth the best energies of his mind and helped to rouse an apathetic and ignorant public to its duties and responsibilities. Fawcett was defeated at Brighton in February 1874. Two months later, however, he was elected for Hackney, and retained the seat during his life. In 1876 he was re-elected to the Indian Finance Committee, and continued his searching investigations with a view to promote a stricter economy in the Indian budget, and a more effective responsibility in the management of Indian accounts.

As an opponent of the Disraeli government (1874-1880) Fawcett came more into line with the Liberal leaders. In foreign politics he gave a general adhesion to Gladstone's views, but he continued to devote much attention to Indian matters, and it was during this period that he produced two of his best publications. His Free Trade and Protection (1878) illustrated his unshaken devotion as a free trader to Cobdenite ideas. At the same time his admiration for Palmerston and his repugnance to schemes of Home Rule show that he was not by any means a peace-at-any-price man. He thought that the Cobdenites had deserved well of their country, but he always maintained that their foreign policies were biased to excess by purely commercial considerations. As beffited a writer whose linguistic gifts were of the slendest, Fawcett's English was a sound homespun, clear and unpretentious. In a vigorous employment of the vernacular he approached Cobett, whose writing he justly admired. The second publication was his Indian Finance (1878), three essays reprinted from the Nineteenth Century, with an introduction and appendix. When the Liberal party returned to power in 1880 Gladstone offered Fawcett a place in the new government as postmaster-general (without a seat in the cabinet).

On Egyptian and other questions of foreign policy Fawcett was often far from being in full harmony with his leaders, but his position in the government naturally enforced reserve. He was, moreover, fully absorbed by his new administrative functions. He gained the sympathy of a class which he had hitherto done little to conciliate, that of public officials, and he showed himself a most capable head of a public department. To his readiness in adopting suggestions, and his determination to push business through instead of allowing it to remain permanently in the stage of preparation and circumspection, the public is mainly indebted for five substantial postal reforms:—(1) The parcels post, (2) postal orders, (3) sixpenny telegrams, (4) the banking
of small savings by means of stamps, (5) increased facilities for life insurance and annuities. In connexion with these last two improvements Fawcett, in 1880, with the assistance of Mr James Cardin, took great pains in drawing up a small pamphlet called *Aids to Thrift*, of which over a million copies were circulated gratis. A very useful minor innovation of his provided for the announcement on every pillar-box of the time of the "next collection." In the post-office, as elsewhere, he was an advocate of the employment of women. Proportional representation and the extension of franchise to women were both political doctrines which he adopted very early in his career, and never abandoned. Honours were showered upon him during his later years. He was made an honorary D.C.L. of Oxford, a fellow of the Royal Society, and was in 1883 elected lord rector of Glasgow University. But the stress of departmental work soon began to tell upon his health. In the autumn of 1882 he had a sharp attack of diphtheria complicated by typhoid, from which he never properly recovered. He resumed his activities, but on the 6th of November 1884 he succumbed to a fresh attack of congestion of the lungs. He was buried in Trumpton churchyard, near Cambridge, and to his memory were erected a monument in Westminster Abbey, a statue in Salisbury market-place, and a drinking fountain on the Thames embankment.

In economic matters Fawcett's position can best be described as transitional. He believed in co-operation almost as a panacea. In other matters he clung to the old *laissez-faire* theorists, and was a strong anti-socialist, with serious doubts about free education, though he supported the Factory Acts and wished their extension to agriculture. Apparent inconsistencies were harmonized to a great extent by his dominating anxiety to increase the well-being of the poor. One of his noblest traits was his kindliness and genuine affection for the humble and oppressed, countrylabourers and the like, for whom his sympathies seemed always on the increase. Another was his disposition to interest himself in and to befriend younger men. In the great affliction of his youth Fawcett bore himself with a fortitude which it would be difficult to parallel. The effect of his blindness was, as the event proved, the reverse of calamitous. It brought with it an increasing sense of his subject to many of the courtiers at an earlier date than would otherwise have been possible, and it had a mellowing influence upon his character of an exceptional and beneficent kind. As a youth he was rough and canny, with a suspicion of harshness. The kindness evoked by his misfortune, a strongly reciprocated family affection, a growing capacity for making and keeping friends—these and other causes tended to ripen all that was best, and apparently that only, in a strong but somewhat stern character. His acerbity passed away, and in later life was reserved exclusively for official witnesses before parliamentary committees. Frank, helpful, conscientious to a fault, a shrewd gossip, and a staunch friend, he was a man whom no one could help liking. Several of his letters to his father and mother at different periods of his career are preserved in Leslie Stephen's admirable *Life* (1885), and show a goodness of heart, together with a homely simplicity of nature, which is most touching. In appearance Fawcett was gaunt and tall, over 6 ft. in height, large of bone, and massive in limb. (T. S.)

**Fawcett, John** (1768–1837), English actor and playwright, was born on the 20th of August 1768, the son of an actor of the same name (d. 1793). At the age of eleven he was sent away from school and appeared at Margate as Courtfall in *The Belle's Stratagem*; afterwards he joined Tate Wilkinson's company and turned from tragedy to low comedy parts. In 1791 he appeared at Covent Garden, and in 1794 at the Haymarket. Colman, then manager of that house, wrote a number of parts designed to suit his talents, and two of Fawcett's greatest successes were as Dr. Pangloss in *The Heir of Love* (1797) and as Dr Ollopad in *The Poor Gentleman* (1798). He retired from the stage in 1830.

**Fawkes, Francis** (1720–1777), English poet and divine, was born at Warmworth, near Doncaster, Yorkshire, where his father was rector, and was baptized on the 4th of April 1720. After studying at Jesus College, Cambridge, where he graduated in 1745, he took holy orders, and was successively curate of Bramham, curate of Croydon, vicar of Orpington, and rector of Hayes, and finally was made one of the chaplains to the princess of Wales. His first publication is said to have been *Bramham Park, a Poem*, in 1745; a volume of poems and translations appeared in 1761, and *Pratridge Shooting*, an eclogue, in 1764. His translations of the minor Greek poets and Ossian, and *Bion and Moschus, Theocritus and Apollonius*—acquired for him considerable fame, but they are less likely to be remembered than his fine song, "Dear Tom, this brown jug, that now foams with mild ale." Fawkes died on the 26th of August 1777.
reported that nothing had been moved or touched. He returned accordingly to his lonely and perilous vigil on the 4th of November. On that day the earl of Sufolk, as lord chamberlain, visited the vault, accompanied by Montague, remarked the quantity of faggots, and asked Fawkes, now described as "a very tall and desperate fellow," who it was that rented the cellar. Percy's name, which Fawkes gave, aroused fresh suspicions and they retired to inform the king. At about ten o'clock Robert Keyes, who had just left, watched, that he might know how the anxious hours were passing, and very shortly afterwards he was arrested, and the gunpowder discovered, by Thomas Knyvett, a Westminster magistrate. Fawkes was brought into the king's bedchamber, where the ministers had hastily assembled, at one o'clock. He maintained an attitude of defiance and of "Roman resolution," smiled scornfully at his questioners, making no secret of his intentions, replied to the king, who asked why he would kill him, that the pope had excommunicated him, that "dangerous diseases require a desperate remedy," adding fiercely to the Scotch merchant who surrounded him that "one of his objects was to blow back the Scots into Scotland." His only regret was the failure of the scheme. "He carried himself," writes Salisbury to Sir Charles Cornwallis, ambassador at Madrid, "without any fear or perturbation . . . under all this action he is noe more dismayed, nay scarce any more troubled than if he was taken for a poor robbery upon the highway," declaring "that he is ready to die, and rather wisheth 10,000 deaths, than willingly to accuse his master or any other." He refused stubbornly on the following days to give information concerning his accomplices: on the 8th the king offered him a place of the nobility, and it was not till the 9th, when the fugitive conspirators had been taken at Holbeche, that that torture could wring from him their names. His imperfect signature to his confession of this date, consisting only of his Christian name and written in a faint and trembling hand, is probably a ghastly testimony to the severity of the torture ("per gradus ad imum") which James had ordered to be applied, if he would not otherwise confess and the "gentler tortures" were unavailing,—a horrible practice unrecognized by the law of England, but usually employed and justified at this time in cases of treason to obtain information. He was visited, together with the two Winters, John Grant, Ambrose Rowkwood, Robert Keyes and Thomas Bates, before a special commission in Westminster Hall on the 27th of January 1606. In this case there could be no defence and he was found guilty. He suffered death in company with Thomas Winter, Rowkwood and Keyes on the 31st, being drawn on a hurdle from the Tower to the Parliament House, opposite which he was executed. He made a short speech on the scaffold, expressing his repentance, and mounted the ladder last and with assistance, being weak from torture and illness. The usual barbarities practised upon him after he had been cut down from the gallows were inflicted on a body from which all life had already fled.

See also GUNPOWDER PLOT.

The lanter said to be Guy Fawkes is in the Bodleian library at Oxford.

FÁY, ANDRÁS (1786–1864), Hungarian poet and author, was born on the 30th of May 1786, at Kohány in the county of Zemplin, and was educated for the law at the Protestant college of Sárospatak. His Mestek (Fables), the first edition of which appeared at Vienna in 1820, evinced his powers of satire and invention, and won him the well-merited applause of his countrymen. These fables, which, on account of their originality and simplicity, caused Fáy to be regarded as the Hungarian Aesop, were translated into German by Petz (Raab, 1825), and partly into English by E. D. Butler, Hungarian Poems and Fables (London, 1877). Fáy wrote also numerous poems, the chief of which are to be found in the collections Bokréta (Nosegay) (Pest, 1807), and Fris Bokréta (Fresh Nosegay) (Pest, 1818). He also composed plays and romances and tales. In 1835 Fáy was elected to the Hungarian diet, and was for a time the leader of the opposition party. It is to him that the Pest Savings Bank, the first of its kind in Hungary, owes its origin. He was one of the founders of the Hungarian national theatre. He died on the 26th of July 1864. His earlier works were collected at Pest (1843–1844, 8 vols.). The most noteworthy of his later works is a humorous novel entitled Jásor evres és Bakalor Ambusz szolgála (Jásor the Doctor and his servant Ambrose Bakator) (Pest, 1855, 2 vols.).
FAYETTEVILLE—FAZOGLI

FAYETTEVILLE, a city and the county-seat of Cumberland county, North Carolina, U.S.A., on the W. bank of the Cape Fear river (at the head of steamboat navigation), about 80 m. N.W. of Wilmington. Pop. (1890) 4222; (1900) 4670, including 2221 negroes; (1910) 7045. It is served by the Atlantic Coast Line railway and the short Raleigh & Southport railway, and by steamboat lines to Wilmington. A scheme was set on foot for the improvement by canalization of the Cape Fear river above Wilmington under a Federal project of 1892, which provided for a channel 8 ft. deep at low water from Wilmington to Fayetteville. Below this point, Cross Creek, which is located below the Cape Fear, is wide and 16 ft. deep, was completed in 1889, and the project of 1889 provided for an increase in depth to 20 ft. Pine forests surround the town, and oaks and elms of more than a century's growth shade its streets. Fayetteville has two hospitals (each with a training school for nurses), and is the seat of a state coloured normal school and of the Donaldson military school. Several creeks and the upper Cape Fear river furnish considerable water-power, and in or near Fayetteville are manufactories of cotton goods, silk, lumber, wooden-ware, turpentine, carriages, wagons, ploughs, coffins, &c. In the earlier half of the 18th century Fayetteville was a great inland market for the western part of the state, for eastern Tennessee and for south-western Virginia. There is a large vineyard in the vicinity; truck-gardening is an important industry in the surrounding country; and Fayetteville is a shipping centre for small fruits and vegetables, especially lettuce, melons and berries. The municipality owns its water-works and its electric-lighting plant. The vicinity was settled between 1730 and 1747 by Highlanders, the settlement called Cross Creek lying within the present limits of Fayetteville. In 1762, by an act of the assembly, a town was laid out including Cross Creek, and was named Campbelltown for “Campbellston”; but in 1784, when Lafayette visited the town, its name was changed in his honour to Fayetteville, though the name Cross Creek continued to be used locally for many years. Flora McDonald, the famous Scottish heroine, came to Campbelltown in April 1775 with her husband and children, and here she seems to have lived during the remainder of that year. The general assembly of the state met at Fayetteville in 1787, 1788 and 1789 (Newbern, Tarboro, Hillsboro and Fayetteville all being rivals at this time for the honour of becoming the permanent capital); and in 1789 the Federal constitution was here ratified for North Carolina. In 1831 most of the town was burned. At the outbreak of the Civil War, the state authorities seized the United States Arsenal at Fayetteville, which contained 37,000 muskets and a complete equipment for a battery of light artillery. In March 1865 General W. T. Sherman and his army took possession of the town, destroyed the arsenal, and did considerable damage to property. Fayetteville was chartered as a city in 1863. A serious flood occurred in August 1908.

FAYER, SIR JOSEPH, Bart. (1834–1907), English physician, was born at Plymouth on the 6th of December 1834. After studying medicine at Charing Cross Hospital, London, he was in 1847 appointed medical officer of H.M.S. "Victory," and soon afterwards accompanied the 3rd Lord Mount-Edgcumbe on a tour through Europe, in the course of which he saw fighting at Palermo and Rome. Appointed an assistant surgeon in Bengal in 1839, he went through the Burmese campaign of 1852 and was political assistant and Residency surgeon at Lucknow during the Mutiny. From 1859 to 1872 he was professor of surgery at the Medical College of Calcutta, and when the prince of Wales made his tour in India he was appointed to accompany him as physician. Returning from India, he acted as medical officer of the Medical Board of the India office from 1874 to 1895, and in 1886 he was created a baronet. Sir Joseph Fayer, who became a fellow of the Royal Society in 1877, wrote much on subjects connected with the practice of medicine in India, and was especially known for his studies on the poisonous snakes of that country and on the physiological effects produced by their virus (Thornatophidia of India, 1872). In 1900 appeared his Recollections of My Life. He died at Falmouth on the 21st of May 1907.

FAYUM, a mudiria (province) of Upper Egypt, having an area of 460 sq. m. and a population (1907) of 441,583. The capital, Medinet-el-Fayum, is 51 m. S.S.W. of Cairo by rail. The Fayum proper is an oasis in the Libyan Desert, its eastern border being about 15 m. west of the Nile. It is connected with that river by the Bahr Yusuf, which reaches the oasis through a gap in the hills separating the province from the Nile Valley. South-west of the Fayum, and forming part of the mudiria, is the Ghurak depression. Another depression, entirely barren, the Wadi Rayan, covering 280 sq. m., lies west of the Ghurak. The Fayum was a large plain of great natural fertility, now much encircled by the Libyan hills. The lowest part of the province, the north-west end, is occupied by the Birket el Kerun, or Lake of the Horns, whose surface level is 140 ft. below that of the sea. The lake covers about 78 sq. m.

Differing from the typical oasis, whose fertility depends on water obtained from springs, the cultivated land in the Fayum is formed of Nile mud brought down by the Bahr Yusuf. From this channel, 15 m. in length from Lahun, at the entrance of the gap in the hills, to Medina, several canals branch off and through the province is irrigated, the drainage water flowing into the Birket el Kerun. Over 400 sq. m. of the Fayum is cultivated, the chief crops being cereals and cotton. The completion of the Asuan dam by ensuring a fuller supply of water enabled 20,000 acres of land, previously unirrigated and untaxed, to be brought under cultivation in the three years 1903–1905. Three crops are obtained in twenty months. The province is noted for its figs and grapes, the figs being of exceptionally good quality. Olives are also cultivated. Rose trees are very numerous and most of the attar of roses of Egypt is manufactured in the province. The Fayum also possesses an excellent breed of sheep. Lake Kerun abounds in fish, notably the bull (Nile carp), of which considerable quantities are sent to Cairo.

Medinet el-Fayum (or Medina), the capital of the province, is a great agricultural centre, with a population which increased from 26,000 in 1882 to 37,320 in 1907, and has several large bazaars, mosques, baths and a much-frequented weekly market. The Bahr Yusuf runs through the town, its banks lined with houses. There are two bridges over the stream: one of three arches, which carries the main street and bazaar, and one of two arches over which is built the Kait Bey mosque. Mounds north of the town mark the site of Arsinoh, earlier Crocodilopolis, where was worshipped the sacred crocodile kept in the house of Moeris. Besides Medina there are several other towns in the province, among them Senuris and Tomia to the north of Medina and Senara and Abuksa on the road to the lake, all served by railways. There are also, especially in the neighbourhood of the lake, many ruins of ancient villages and cities. The Fayum is the site of the Lake of Moeris (q.v.) of the ancient Egyptians—a lake of which Birket el Kerun is the shrunken remnant.

See The Fayum and Lake Moeris, by Major (Sir) R. H. Brown, R.E. (London, 1892), a valuable contribution as to the condition of the province at that date, its connexion with Lake Moeris and its possibilities in the future: The Assuan Reservoir and Lake Moeris (London, 1904), by Sir William Willcock—will provide in English, French and German—considerable information about irrigation possibilities: The Topography and Geology of the Fayum Province of Egypt, by H. J. L. Beadnell (Cairo, 1905).

FAZOGLI, or FAZOLI, a district of the Anglo-Egyptian Sudan, cut by 11th N. and bounded E. and S. by Abyssinia. It forms part of the foot-hills of the Abyssinian plateau and is traversed by the Blue Nile and its affluent the Tumat. Immediately south is the auriferous Beni Shangul country. The chief gold-washings lie (in Abyssinian territory) on the west slope of the hills draining to the White Nile. Here is the steep Jebel-Dul, which appears to contain rich gold-bearing reefs, as gold is found in all the ravines on its flanks. The auriferous region extends into Sudane territory, gold dust being found in all the khorus coming from Jebel Faronge on the S.E. frontier. The inhabitants of Faizoli, who are governed, under the Sudan administration, by their own murs or kings, are Berta and other Shangalla tribes with an admixture of Funi blood, the country having been conquered by the Funi rulers of Senara at the close of the 15th
FEA—FEASTS AND FESTIVALS

century. There are also Arao settlements. Fazogli, the residence of the principal mek, is a straggling town built some 800 yds. from the left bank of the Blue Nile near the Tumut confluence, 434 m. by river above Khartum and opposite Famaka, the headquarters of the Egyptians in this region between 1839 and 1883. Above Famaka and near the Abyssinian frontier is the prosperous town of Kiri, where Abu Shanelaa on the Nile below Fazogli, and where the trade route from Beni Shangul strikes the river. The chief imports from Abyssinia are coffee, cattle, transport animals and gold. Durra and tobacco are the principal crops. The local currency includes rings of gold, specially made as a circulating medium.

FEA, CARLO (1753-1836), Italian archaeologist, was born at Pigna in Piedmont on the 2nd of February 1753, and studied law in Rome. He received the degree of doctor of laws from the university of La Sapienza, but archaeology gradually absorbed his attention, and with the view of obtaining better opportunities for his researches in 1798 he took orders. For political reasons he was obliged to take refuge in Florence; on his return in 1799 he was imprisoned by the Neapolitans, at that time in occupation of Rome, as a Jacobin, but shortly afterwards liberated and appointed Commissario delle Antichità and librarian to Prince Chigi. He died at Rome on the 18th of March 1836.

FEA, revised, with notes, an Italian translation of J. J. Winckelmann's Geschichte der Kunst, and also added notes to some of G. L. Bianconi's works. Among his original writings the principal are: Miscellanea filologica, critica, e antiquaria; L'integrità del Panteone rivendicata a M. Agrippa; Frammenti de fasti consolari; Iscrizioni di monumenti pubblici e Descrizione di Roma.

PEARNE, CHARLES (1742-1794), English jurist, son of Charles Pearne, judge-advocate of the admiralty, was born in London in 1742, and was educated at Westminster school. He adopted the legal profession, but, though well fitted by his talents to succeed as a barrister, he neglected his profession and devoted most of his attention and his patrimony to the prosecution of scientific experiments, with the vain hope of achieving discoveries which would reward him for his pains and expense. He died in 1794, leaving his widow and family in necessitous circumstances. His Essay on the Learning of Contingent Remains and Executory Decrees, the work which has made his reputation as a legal authority, and which has passed through numerous editions, was called forth by a decision of Lord Mansfield in the case of Perrin v. Blake, and had the effect of reversing that decision.

A volume entitled Pearne's Posthumous Works was published by subscription in 1797 for the benefit of his widow.

FEASTS AND FESTIVALS. A festival or feast is a day or series of days especially and publicly set apart for religious observances. Whether its occurrence be casual or periodic, whether its ritual be grave or gay, carnal as the orgies of Baal and Astarte, or spiritual as the worship of a Puritan Sabbath, it is to be regarded as a virtual or "holy day" as long as it is professedly held in the name of religion.

To trace the festivals of the world through all their variations would be to trace the entire history of human religion and human civilization. Where no religion is, there can of course be no festivals; and without civilization any attempt at festival-keeping must necessarily be futile and comparatively futile. But as religion develops, festivals develop with it, and assume their distinctive character; and an advancing civilization, at least in its earlier stages, will generally be found to increase their number, enrich their ritual, fix more precisely the time and order of their recurrence, and be the outcome of the growth of the spirit of reverence for the divine.

Some uncivilized tribes, such as the Juangs of Bengal; the Fuegians and the Andamanese, have been described as having no word for God, no idea of a future state, and consequently no religious ceremonies of any kind whatever. But such cases, doubtless at the best, are confessedly exceptional. In the vast majority of instances observed and recorded, the religiosity of the savage is conspicuous. Even when incapable of higher manifestations, it can at least take the form of reverence for the dead; the grave-heaps can become an altar on which offerings of food for the departed may be placed, and where in acts of public and private worship the gifts of survivors may be accompanied with praises and with prayers. That the custom of ghost-propitiation by some sort of sacrifice is even now very widely diffused among the lower races of the earth there are also many curious "survivals" of such a habit to be traced among highly civilized modern nations, has been abundantly shown of late by numerous collectors of folk-lore and students of sociology; and indications of the same phenomena can be readily pointed out in the Rig-Veda, the Zend-Avesta and the Pentateuch, as well as in the known usages of the ancient Egyptians, Greeks and Romans. In many cases the ceremonial observed is of the simplest; but it ever tends to become more elaborate; and above all it calls for repetition, and repetition, too, at regular intervals. Whenever this last demand has made itself felt, a calendar begins to take shape. The simplest calendar is obviously the lunar. "The Naga tribes of Assam celebrate their funeral feasts month by month, laying food and drink on the graves of the departed." But it soon comes to be combined with the solar. Thus the Karens, "while habitually making oblations, have also annual feasts for the dead, at which they ask the spirits to eat and drink." The natives of the Mexican valley in November lay animals, edibles and flowers on the graves of their dead relatives and friends. The common people in Peru in 1812, as is said, observed a similar custom at the arrival of the winter solstice. The ancient Peruvians had the custom of burying their embalmed bodies of their dead emperors in the great square of the capital to be feasted in company with the people. The Athenians had their annual Nektora or Neukora and the Romans their Ferialia and Lemuralia. The Egyptians observed their three "festivals of the seasons," twelve "festivals of the month," and twelve "festivals of the half month," in honour of their dead. The Parsees, too, were required to render their ahrigrains (blessings which were to be recited over a meal to which an angel or the spirit of a deceased person was invited) at each of the six divisions of the year, and also on certain other days.

In the majority of recorded instances, the religious feeling of the savage has been found to express itself in other forms besides that of reverence towards the dead. The oldest literatures of the world, at all events, whether Aryan or Semitic, embody a religion of a much higher type than ancestor worship. The hymns of the Rig-Veda, for example, while not without traces of the other, yet indicate chiefly a worship of the powers of nature, connected with the regular recurrence of the seasons. Thus in iv. 57 we have a hymn designed for use at the commencement of the crops and the ploughing time; and in the earliest treatise on Hindu ceremonial, we already find a complete series of satras or sacrificial sessions exactly following the course of the solar year. They are divided into two distinct sections, each consisting of six months of thirty days each. The sacrifices are allowed to commence only at certain lucky conjunctions and in certain months. So, for instance, as a rule, no great sacrifice can commence during the sun's southern progress. The great sacrifices generally take place in spring, in the months of April and May. In the Pahstreaputes the year is divided into six seasons or gahdras of two months each, concluding with February, the season at which great expiatory sacrifices were offered for the growth of the whole creation in the last two months of the year. We have no means of knowing precisely what were the arrangements of the Phoenician calendar, but it

is generally admitted that the worship was solar, the principal festivals taking place in spring and in autumn. Among the most characteristic celebrations of the Egyptians were those which took place at the ἀφανύμα or disappearance of Osiris in October or November, at the search for his remains, and their discovery about the winter solstice, and at the date of his supposed entrance into the moon at the beginning of spring. The Phrygian festivals were also arranged on the theory that the deity was asleep during the winter and awoke during the summer; in the autumn they celebrated his retiring to rest, and in spring they treated with mirth and revelry those days from his slumbers. 

The seasonal character of the Teutonic Oster, the Celtic Beltane and the Scandinavian Yule is obvious. Nor was the habit of observing such festivals peculiar to the Aryan or the Semitic race. The Mexicans, who were remarkable for the perfection of their calendar, in addition to this had an elaborate system of movable and immovable feasts distributed over the entire year; the principal festivals, however, in honour of their chief gods, Tezcatlipoca, Huiztilopochtli and Tlaloc, were held in May, June and December. Still more plainly connected with the solar year was the public worship of the ancient Peruvians, who, besides the ordinary feast at each new moon, observed four solar festivals annually. Of these the most important was the Yantip-Raymi (Sun-feast), which, preceded by a three days' fast, began with the summer solstice, and lasted for nine days. Its ceremonies have been often described. A similar but less important festival was held at the winter solstice. The Cusqui-Raymi, held after seedtime, as the maize began to appear, was celebrated with sacrifices and banquets, music and dancing. A fourth great festival, called Citua, held on the first new moon after the autumnal equinox, was preceded by a strict fast and special observances intended for propitiations of purification and expiation, after which the festivities lasted until the moon entered her second quarter.

**Greek Festivals.**—Perhaps the annual Attic festival in honour of Erebichus alluded to in the Iliad (ii. 550) ought to be regarded as an instance of ancestor-worship; but the seasonal character of the ἕσχα or new-moon feast in Od. xx. 156, and of the βαθιστα or harvest-festival in II. ix. 533, is generally acknowledged. The older Homeric poems, however, give no such express indications of a fully-developed system of festivals as are to be met with in the so-called "Homerical" hymns, in the Works and Days of Hesiod, in the pages of Herodotus, and so abundantly in most authors of the second, the third, the fourth and the fifth century B.C. It is manifest that the calendar of Homer or even of Herodotus must have been a much simpler matter than that of the Tarentines, for example, came to be, of whom we are told by Strabo that their holidays were in excess of their working days. Each demos of ancient Greece during the historical period had its own local festivals (τοπαλ διονυσια), often largely attended and splendidly solemnized, the usages of which, though essentially alike, differed very considerably in details. These details have in many cases been wholly lost, and in others have reached us only in a very fragmentary state. But with regard to the Athenian calendar, the most important of all, our information is fortunately very copious. It included some 50 or 60 days on which all business, and especially the administration of justice, was by order of the magistrates suspended. Among these ἑορτασιαι were included—in Gamelion (January), the Lenaea or festival of vats in honour of Dionysus; in Anthesterion (February), the Anthesteria, also in honour of Dionysus, lasting three days (Pithoigia, Choes and Chytria); the Diaia in honour of Zeus, and the lesser Eleusinia; in Elaphobolion (March), the Panhyla (or Zeus), the Elephobia of Artemis, and the greater Dionysia; in Munychion, the Munychia of Artemis as the moon goddess (Mounya) and the Delphinia of Apollo; in Thargelion (May), the Thargelia of Apollo and the Plynteria and Callylvnteria of Athena; in Scirophion (June), the Diopolia of Zeus and the Scirophoria of Athena; in Hekatomhion, hecatombs were offered to Apollo the summer-god, and the Cronia of Cronus and the Panathenaica

1 Plutarch, De Iside et Osiride; Macrobius, Saturnalia, i. 21. of Athens were held; in Metageitnion, the Metageitnia of Apollo; in Boedromion, the Boeotria of Apollo the helper, 2 the Nebukia or Nemesia (the festival of the dead), and the greater Eleusinia; in Pyanepion, the Pyanepia of Apollo, the Oschophoria of Dionysus (probably), the Chalkia or Athena of Athens, the Thesmophoria of Demeter, and the Apaturia; in Maimakterion, the Maimacteria of Zeus; and in Poseideon (December), the lesser Dionisia.

Of these some are commemorative of historical events, and one at least may perhaps be regarded as a relic of ancestor-worship, but the great majority are nature-festivals, associating themselves in the manner that has already been indicated with the phenomena of the seasons, the equinoxes and the solstices. In addition to their numerous public festivals, the Greeks held various family celebrations, also called ἱππαι, in connexion with weddings, births and similar domestic occurrences. For the great national ἱππαι—Olympian, Pythian, Nemean and Isthmian—see the article GAMES, CLASSICAL.

**Roman Festivals.**—For the purpose of holding comitia and administering justice, the days of the Roman year were regarded as either dies fasti or dies nefasti. The dies fasti being the days on which it was lawful for the praetors to administer justice in the public courts, while on the dies nefasti neither courts of justice nor meetings of comitia were allowed to be held. Some days were fasti during one portion and nefasti during another; these were called dies interici. For the purposes of religion a different division of the year was made; the days were treated as fasti or as profesti,—the former being consecrated to acts of public worship, such as sacrifices, banquets and games, while the latter (whether fasti or nefasti) were not specially claimed for religious purposes. The dies fasti or feriae publicae were such as were observed regularly, each one of them being called the conceptivae were observed annually on days fixed by the authorities for the time being; the imperativae were publicly appointed as occasion called for them. In the Augustan age the feriae statuae were very numerous, as may be seen from what we possess of the Fasti of Ovid. The number was somewhat fluctuating. Festivals frequently fell into desuetude or were revived, were increased or diminished, were shortened or prolonged at the will of the emperor, or under the caprice of the popular taste. Thus Augustus restored the Comptalia and of the Latae while Marcus Antoninus in his turn found it expedient to diminish the number of holidays.

The following is an enumeration of the stated festivals as given by Ovid and contemporary writers. The first day of January was observed somewhat as is the modern New Year's day: clients sent presents to their patrons, slaves to their masters, friends and relatives to one another. On the 9th the Agonalia were held, apparently in honour of Janus. On the 11th the Cormentalia were kept as a half-holiday, but principally by women; so also on the 13th. On the 15th of February were the Quirinalia, on the 15th of Lupercalia, on the 17th the Cerealia, on the 18th and 19th of Quirinalia, on the 18th of the Floralia, on the 23rd (at one time last day of the Roman year) the Terminalia, on the 24th the Regifugium or Fugalia, and on the 27th the Equitaria (of Mars). On the 1st of March were the Marthonalia, on the 14th a repetition of the Equitaria, on the 15th the festival of Anna Perenna, on the 17th the Liberalia or Agonalia, and from the 19th to the 23rd the Quinquatrina (of Minerva). On the 4th of April were the Megalalia (of Cybele), on the 12th the Cerialia, on the 21st the Palilia, on the 23rd the Vinalia, on the 25th the Roglobata, and on the 28th the Floralia. The 1st of May was the festival of the Great Paeans; on the 9th, 11th and 15th the Lemuria were celebrated; on the 12th the Ludi Martiales, and on the 17th those of Mercury. June 5 was sacred to Sona Vactus; the Vestalia occurred on the 9th, the Matralia on the 11th, and the

1 In this month the anniversaries of the battle of Marathon, and of the downfall of the thirty tyrants, were also publicly celebrated.

2 See Schoemann, Griechische Alttertumer, ii. 439 seq.; Mommsen, Historiography.

3 Feriae privatae, such as anniversaries of births, deaths and the like, were observed by separate clans, families or individuals.
Feasts and Festivals

Quinquatrus Minusculae on the 13th. The Ludi Apollinares were on the 5th, and the Nepturnalia on the 23rd of July. On the 13th of August were the Nemoralia, in honour of Diana; on the 18th the Consualia, on the 19th the Vinalia Rustica, and on the 23rd the Vinalia Terrena. The Ludi Magni, in honour of Jupiter, Juno, and Minerva, began on September 4. The Meditrinalia (new wine) were on the 11th of October, the Faunalia on the 15th, and the Equiria on the 15th. The Epulum Jovis was on 15th November. The December festivals were—on the 5th Faunalia, and towards the close Opalia, Saturnalia, Larentalia.

The calendar as it stood at the Augustan age was known to contain many comparatively recent accessions, brought into the influence of two closely allied powers, the foreign priest and the foreign cook (Mommsen). The Megalaia, for example, had been introduced 204 B.C. The Ludi Apollinares could not be traced farther back than 208 B.C. The Floralia and Cerialia had not come in much earlier. Among the oldest feasts were undoubtedly the Lupercalia, in honour of Lupercus, the god of fertility; the Equiria, in honour of Mars; the Palilia, the great September festival; and the Saturnalia.

Among the feriae concepctae were the very ancient feriae Latinae, held in honour of Jupiter on the Alban Mount, and attended by all the higher magistrates and the whole body of the senate. The time of their celebration greatly depended on the state of affairs at Rome, as the consuls were not allowed to take the field until they had held the Latiae, which were regarded as the opening of the festival year. The feriae somnativa were held in the spring, and the Ambarvalia in autumn, both in honour of Ceres. The Paganalia of each pagus, and the Compitalia of each vicus were also concepctae. Of feriae imperative— that is to say, festivals appointed by the senate, or magistrates, or higher priests to commemorate some great event or avert some threatened disaster—the best known is the Novensiae, which used to be celebrated as often as stones fell from heaven (Livy xx. 62, xxv. 7, &c.). In addition to all those already mentioned, there occasionally occurred ludi solsti, which were celebrated in fulfilment of a vow; ludi funebres, sometimes given by private persons; and ludi seculares, to celebrate certain periods marked off in the Etrusco-Roman religion.

Feasts of the Jews.—By Old Testament writers a festival or feast is generally called either (compare the Arabic Hadj), from φεστανία, to rejoice, or υπερήφανος, to appoint. The words φεστανία and υπερήφανος are also occasionally used. In the Talmud the three principal feasts are called ול الفني, after Exod. xxiii. 14. Of the Jewish festivals which are usually traced to a pre-Mosaic origin the most important and characteristic was the weekly Sabbath, but special importance was also attached from a very early date to the Jewish festival year. The prophetical books of the Old Testament, in particular, are full of hints as to the annual festivals, and a seasonal character, were observed (see Exod. v. 1). In common with most others, the Mosaic system of annual feasts groups itself readily around the vernal and autumnal equinoxes. In Lev. xxiii., where the list is most fully given, they seem to be arranged with a conscious reference to the solar number seven (compare Numb. xxviii.). Those belonging to the vernal equinox are three in number; a preparatory day, that of the Passover, leads up to the principal festival, that of unleavened bread, which again is followed by an after-feast, that of Pentecost (see PASSOVER, PENTECOST). Those of the autumnal equinox are four; a preparatory day on the new moon of the seventh month (the Feast of Trumpets) is followed by a great day of rest, the day of Atonement (which, however, was hardly a festival in the stricter sense of the word), by the Feast of Tabernacles, and by a great concluding day (Lev. xxiii. 36; John vii. 37). If the feast of the Passover be excepted, it will be seen that all these celebrations or commemorations associate themselves more readily with natural than with historical events. There was also a considerable number of post-Mosaic festivals, of which the principal were that of the Dedication (described in 1 Mac. iv. 52-59; comp. John x. 22) and that of Purim, the origin of which is given in the book of Esther (ix. 20 seq.). It has probably not coincided with the Persian festival Purdigan (see Esther).

Earlier Christian Festivals.—While making it abundantly manifest that Christ and his disciples observed the appointed Jewish feasts, the New Testament nowhere records the formal institution of any distinctively Christian festival. But we have unambiguous evidence of the actual observance, from a very early period, of the first day of the week as a holy day (John xx. 19, 26; 1 Cor. xvi. 2; Acts xx. 7; Rev. i. 10). Pliny, in his letter to Trajan describes the Christians of Bithynia as meeting for religious purposes on a set day; that this day was Sunday is put beyond all reasonable doubt by such a passage as that in the Apology of Justin Martyr, where he says that "on Sunday (την Σάββατον θεότητα των all the Christians living either in the city or the country met together." The Jewish element, in some churches at least, and especially in the East, was strong enough to secure that, along with the dies dominicae, the seventh day should continue to be kept holy. Thus in the Apostolic Constitutions (i. 59) we find the Saturday specially mentioned along with the Sunday as a day for the assembling of the church; in v. 15 it is ordained that there shall be no fasting on Saturday, while in viii. 33 it is added that both on Saturday and Sunday slaves are to have rest from their labours. The 16th can of the council of Laodicea (see also the Eugubium, which, if we can judge from the evidence of the city council of Trajan, was still in being long afterwards) states that the festival of the Christian church, when historically investigated, can be traced to very small beginnings. Indeed, while it appears to be tolerably certain that Jewish Christians for the most part retained all the festivals which had been instituted under the old dispensation, it is not at all probable that either they or their Gentile brethren recognized any yearly feasts as of distinctively Christian origin or obligation. It cannot be doubted, however, that gradually, in the course of the 2nd century, the universal church came to observe the anniversaries of the death and resurrection of Christ—the πάσχα εστάσεως and the πάσχα νεκρησίος, as they were called—both in the East and West. Thus, while long afterwards Whitsunday also came to be fixed in the usage of Christendom as a great annual festival. Even Origen (in the 8th book Against Celsus) enumerates as Christian festivals the Sunday, the επιφανεία, the Passover, with the feast of the Resurrection, and Pentecost; under which latter term, however, he includes the whole period between Easter and Whitsun tide. About Cyprian's time we find individual Christians commemorating their departed friends, and whole churches commemorating their martyrs; in particular, there are traces of a local and particular observance in the church of the Thessalonians. Christmas day and Epiphany were among the later introductions, the feast of the Epiphany being somewhat the earlier of the two. Both are alluded to indeed by Clemens Alexandria (i. 340), but only in a way which indicates that even in his time the precise date of Christ's birth was unknown, that its anniversary was not usually observed, and that the day of his baptism was kept as a festival only by the followers of Basilides (see EPIPHANY).

When we come down to the 4th century we find that, among the 50 days between Easter and Pentecost, Ascension Day has...
come into new prominence. Augustine, for example, enumerates
as anniversaries celebrated by the whole church those of Christ’s
passion, resurrection and ascension, along with that of the out-
pouring of the Holy Ghost, while he is silent with regard to
Christmas and Epiphany. The general tendency of this and the
following centuries was largely to increase the festivals of the
Church, and by legislation to make them more fixed and uniform.
Many passages, indeed, could be quoted from Chrysostom,
Jerome and Augustine to show that these fathers had not by
any means forgotten that comparative regularity. In regard to
outward observances was one of the distinctive ex
c

function, Annunciation, Visitation, Nativity and Conception of the
Virgin, the Nativity of the Twelve Apostles, the feasts of the
Evangelists, of St Stephen, of the Holy Innocents, of St Joseph
and of the Patronicium of Joseph, of St Lawrence, of the Inven-
tion of the Cross and of the Dedication of St Michael. The
Dominicae majores of the first class are the first Sunday in
Advent, the first in Lent, Passion Sunday, Palm Sunday, Easter
Sunday, Dominica in Albus, Whitsunday and Trinity Sunday ;
the Dominicae majores of the second class are the second, third
and fourth in Advent, Septuagesima, Sexagesima and Quinquag-

In the canons and decrees of the council of Trent repeated
allusions are made to the feast days, and their fitness, when
properly observed, to promote piety. Those entrusted with the
cure of souls are urged to see that the feasts of the Church be
devoutly and religiously observed, the faithful are enjoined
to attend public worship on Sundays and on the greater festivals
at least, and parish priests are hidden to expound to the people
on such days some of the things which have been read in the
Church service for the day.

The calendar of the Greek Church is even fuller than that
of the Latin, especially as regards the ἐορταὶ νῦν ἔγχρωμα. Thus on
the last Sunday in Advent the feast of All Saints of the Old
Covenant is celebrated; while Adam and Eve, Job, Elijah,
Isaiah, &c., have separate days. The distinctions of ritual are
analogous to those in the Western Church. In the Coptic Church
there are seven great festivals, Christmas, Epiphany, the
Annunciation, Palm Sunday, Easter Sunday, Ascension and
Whitsunday, on all of which the Copts “wear new clothes (or
the best they have), feast and give alms” (Lane). They also
observe, as minor festivals, Maundy Thursday, Holy Saturday,
the feast of the Apostles (11th July), and that of the Discovery
of the Cross.

The Church of England, in common with most of the churches of the Reformation,
retained a certain number of feasts besides all Sundays in the year. They are, besides Monday and
Tuesday both in Easter-week and Whitsun-week, as follows: the Circumcision, the Epiphany,
the Conversion of St Paul, the Purification of the Blessed Virgin, St Matthias the Apostle,
the Annunciation of the Blessed Virgin, St Mark the Evangelist, St Philip and St James (Apostles),
the Ascension, St Barnabas, the Nativity of St John Baptist, St Peter the Apostle, St James the Apostle, St Bartholomew, St Matthew, St Michael and all Angels, St Luke the Evangelist,
St Simon and St Jude, All Saints, St Andrew, St Thomas, Christmas, St Stephen, St John
the Evangelist, the Holy Innocents. The 13th canon enjoins
that all manner of persons within the Church of England shall
be from henceforth celebrate and keep the Lord’s day, commonly
called Sunday, and other holy days, according to God’s holy will
and pleasure, and the orders of the Church of England prescribed
in that behalf, that is, in hearing the Word of God read and
taught, in private and public prayers, in acknowledging their
offences to God and amendment of the same, in reconciling them-

vaguely called holy-days, having no warrant in the Word of God,

1 As, at a later period (601), Gregory the Great instructed his
Anglo-Saxon missionaries so to Christianize the temples, festivals,
&c., of the heathen “ut durae mentes gradibus vel passibus, non
autem salibus, eleverunt.”

2 Manumission, however, was lawful on any day.
are not to be continued; nevertheless it is lawful and necessary, upon special emergent occasions, to separate a day or days for public fasting or thanksgiving, as the several eminent and extraordinary dispensations of God’s providence shall administer cause and opportunity to his people.

Several attempts have been made at various times in western Europe to reorganize the festival system on some other scheme than the Christian. Thus at the time of the French Revolution, during the period of Robespierre’s ascendancy, it was proposed to substitute a tenth day (Décadi) for the weekly rest, and to introduce the following new festivals: that of the Supreme Being and of Nature, of the Human Race, of the French people, of the Benefactors of Mankind, of Freedom and Equality, of the Martyrs of Freedom, of the Republic, of the Freedom of the World, of Patriotism, of Hatred of Tyrants and Traitors, of Truth, of Justice, of Modesty, of Fame and Immortality, of Friendship, of Temperance, of Heroism, of Fidelity, of Unselfishness, of Stoicism, of Love, of Conjugal Fidelity, of Filial Affection, of Childhood, of Youth, of Manhood, of Old Age, of Misfortune, of Agriculture, of Industry, of our Forefathers, of Posterity and Felicity. The proposal, however, was never fully carried out, and soon fell into oblivion.

Mahomedan Festivals.—These are chiefly two—the ‘Eed es-Sagheer (or minor festival) and the ‘Eed el-Kebeer (or great festival), sometimes called ‘Eed el-Kurban. The former, which lasts for three days, immediately follows the month Ramadan, and is generally the more joyful of the two; the latter begins on the tenth day of Zu-Heggeh (the last month of the Mahommite year), and lasts for three or four days. Besides these festivals they usually keep holy the first five days of Moharram (the first month of the year), especially the tenth day, called Yom Asoora; the birthday of the prophet, on the twelfth day of the third month; the birthday of El-Hoseyn, in the fourth month; the anniversary of the prophet’s miraculous ascension into heaven, in the seventh month; and one or two other anniversaries. Friday, called the day of El-Gumah (the assembly), is a day of public worship; but it is not usual to abstain from public business on that day except during the time of prayer.

In modern India the leading popular festivals are the Holi, which is held in March or April and lasts for five days, and the Dasahara, which occurs in October. Although in its origin Buddhism was a deliberate reaction against all ceremonial, it does not now refuse to observe festivals. By Buddhists in China, for example, three days in the year are especially observed in honour of the Buddha,—the eighth day of the second month, when he left his home; the eighth day of the fourth month, the anniversary of his birthday; and the eighth of the twelfth, when he attained to perfection and entered Nirvana. In Siam the eighth and fifteenth days of every month are considered holy, and are observed as days for rest and worship. At Trut, the festival of the close of the year, visiting and play-going are universal. The new year (January) is celebrated for three days; in February is another holiday; in April is a sort of Lent, ushering in the rainy season; on the last day of June presents are made of cakes of the new rice; in August is the festival of the angel of the river, “whose forgiveness is then asked for every act by which the waters of the Meimah have been rendered impure.” See Bowring’s Siam and Carné’s Travels in Indo-China and the Chinese Empire. Copious details of the elaborate festival-system of the Chinese may be found in Doolittle’s Social Life of the Chinese.

LITERATURE.—For Christian feasts see K. A. H. Kellner, Heortologie (Freiburg im Breisgau, 1906); Hippolyte Delachaye, Les Légendes hagiographiques (Brussels, 1905); J. Renel Harris, The Cult of the Heavenly Twins (Cambridge, 1906); de Rossi-Duchesne, Martyrologium Hieronymianum.

FEATHER (O. Eng. fether, Ger. Feder, from an Indo-European root seen also in Gr. ἰπέρ, and περισθαί, to fly), a horny outgrowth of the skin of birds homologous with the scale of the reptile. The body-covering of birds is, without exception, comprised of feathers, and by this character alone birds may be distinguished from all other animals.

The most perfect form of feather is made up of a long, tapering rod, fringed on either side, for the greater part of its length, by a secondary series of slender and tapering rods forming a more or less acute angle with the central axis. This fringe is known as the vexillum or “vane” (fig. 1 a). The central axis is divisible into two distinct parts,—a hollow, cylindrical, transparent calamus, or “quill,” the base of which is inserted into the skin, and a solid, quadrangular rhachis or “shaft” which supports the vane. At the lower end of the quill is a small hole—the lower umbilicus—through which the nutritive pulp passes during the growth of the feather: while at the upper end, where it passes into the shaft, a similar hole will be found,—the upper umbilicus—and from this the last remains of the capsules which contained the nutritive pulp may sometimes be seen protruding. If the quill is cut open a series of these capsules will be found fitting one into the other throughout the whole length of the tubular chamber.

**Fig. 1.** —Diagrams of Feather-Barbs.

a. Outline of a feather showing the relation of the barbs and barbules to the central axis or shaft.
b. Section across two of the barbs shown in a, highly magnified.
c. Two barbules of the posterior series—seen only in cross-section in b.
d. A barbule of the anterior series.
e. Section across the base of three anterior barbules showing attachment to barb.
f. A portion of the hooklet of the anterior series showing the method of interlocking with the barbules of the posterior series.

The rods comprising the lateral fringe, or vane, are known as the ramis or the “barbs,” and will be found, on microscopic examination, to be lath-shaped and to taper to a point. Further, each barb supports a double series of smaller outgrowths known as the radii, or “barbules”; so that each barb may be likened to a feather in miniature. These “barbules,” however, differ markedly in structure on the two sides of the barb, those pointing towards the tip of the feather—the “anterior barbules” —being ribbon-shaped from the base outwards for about half their length, when they become cut up to form a series of long and very delicate hooklets (fig. 1 d). On the opposite side of the barb the barbules are also ribbon-shaped for about half their length, but the ribbon is curved (tough-fasion), so that the whole series of posterior barbules forms a number of deep valleys, and into these the hooklets are thrust so as to catch hold of the upper edges of the troughs, which are set so that the
upper edge is towards the upper, and the lower edge towards the under surface of the feather. The manner in which this beautiful mechanism works may be seen in fig. 16.

In one of the primary or "quill" feathers of the wing of a crane, each barb of the inner side of the vane was found to bear about 600 pairs of barbules, which would make about 800,000 barbules for the inner web of the vane alone, or more than a million for the whole feather (H. F. Gadow). It is to the agency of these hooklets alone that the closely-knit, elastic vanes of the flight feathers and the body feathers are due. Where these hooklets are wanting the bars do not adhere together, resulting in a loose "discontinuous" vane such as, for example, is found in the plumes of the ostrich.

Many feathers, in addition to the main axis, bear a second, generally much shorter axis, supporting a loose discontinuous vane; this shorter branch is known as the "aftershaft" and arises from the under surface of the feather. Only in the cassowary and emu among adult birds is the aftershaft as large as the main shaft.

There are several different kinds of feathers—contour feathers, semiplumes, down-feathers, filoplumes and powder-down. Contour feathers, as their name implies, are those which form the contour or outline of the body, and are all that can generally be seen. Those which form the "flight feathers" of the wing, and the tail feathers, are the most perfectly developed. Semiplumes are degenerate contour feathers. The down-feathers are generally completely hidden by the contour feathers: they form in many birds, such as gulls and ducks, a thick under- covering of loose, soft, "woolly" down-fur, under-fur or down, and it is for a large part through the apparatus of the pre-plumulae, pre-pennae, or pre-plumules, that they are distinguished in the tintinnabulum (H. F. Gadow).

These hooklets have a double origin. They are formed by barbules and barbs, the barbules and barbs being large scales, one on each side of the barb, which are embedded in the longer covering vane of the feather.
In addition to these must be reckoned turacin, a reddish-purple pigment consisting of the same elements as zoonelanin, but remarkable for the fact that it contains from 5 to 8% of copper, which can be extracted by a weak alkaline solution, such as ammonia, and with the addition of acetic acid it can be filtered off as a metallic red or blue powder. The presence of metallic copper is indicated by the green flame of these red feathers when burnt. Turacin was discovered by Sir A. H. Church in the quill-feathers of the wings of Touracoes or "planptain eaters." These feathers, he showed, lose their colour after they have become wet, but regain it on drying. But turacin is not, as was supposed, confined to the feathers of the plantain eaters, since it has been obtained from a cuckoo, Dasylophus superciliosus.

What effect food may have on colour in birds in a wild state we have no means of knowing, but it is significant that flamingoes and lilnets in confinement never regain their bright hues after their first moult in captivity. If cyanine pepper be mixed with the food of certain strains of canaries, from the time the birds are hatched onwards, the yellow colour of the feathers becomes intensified, till it takes on a deep orange hue. Bullfinches, if fed on hemp-seed, turn black. According to Darwin, the natives of the Amazonian region feed the common green parrot on the fat of large Siluroid fishes, and as a result the feathers become beautifully variegated with red and yellow. Similarly, in the Malay Archipelago, the natives of Glolio change the colours of another parrot.

With but rare exceptions bright colours are confined to the exposed portions of the plumage, but in some of the Bustards the down is of a bright pink colour. Structural colours include all metallic or prismatic colours, blue, green, white, some yellows, and, in part, glossy black. In metallic feathers the radii (barbules) are modified in various ways, frequent to form flattened, overlapping plates or tiles, while the surfaces of the plates are either smooth, finely striated or pitted. But, save only in the case of white feathers, beneath this colourless, glazed outer coat, there is always a layer of pigment. The mostly green pigment known to occur in feathers is turacin, found in the feathers of the plantain eaters; it contains a relatively large amount of iron, but no copper. In all other cases the green colour of feathers is due to yellow, orange or greyish-brown pigment occurring with a special superstructure consisting of narrow ridges, as in some parrots and pintails (ant-thrushes), or the surface of the bars and barbules is smooth and transparent, while between it and the pigment there exists a layer of small polygonal, colourless bodies having highly refractory, and often striated, surfaces.

Blue is unknown as a pigment in feathers. Blue feathers contain only orange or brownish pigment (Gadow), the blue colour being caused by the combination of pigment corpuscles and colourless striated polygonal bodies, as in green feathers.

While in many birds the coloration takes the form either of a uniform hue or of bands and patches of colour more or less brilliant, in others the coloration is sombre, and made up of dark longitudinal stripes or transverse bars on a lighter ground. The latter is the more primitive, and there seems good reason to believe that longitudinal stripes preceded transverse bars. This is indicated by the fact that the nestlings of the more primitive groups are longitudinally striped, and that young hawks in their first plumage are so striped, while the adults are barred.

There is also evidence to show that the evolution of brilliant plumage began with the males, and has, in many cases, been more or less perfectly acquired by the females, and also by the young, as for example in the kingfishers, where parents and offspring wear the same livery. Often, where the parents are alike in plumage, the young wear a different and duller livery, as in the case of the common stirling (Sturnus vulgaris). But where the female differs from the male in coloration the young resemble the male parent.

The physiological explanation of complete disappearance of pigment in adult life, e.g. gannet, is not yet apparent. At least once annually birds renew their feathers completely by a process known as a moult. Until the new feathers have attained at least half their full length they are invested in a soft sheath, and, as development proceeds, the sheath breaks up from the tip of the feather downwards, so that for times the new feathers have almost a brush-like appearance. Generally this replacement takes place gradually, new and old feathers occurring side by side. and on this account it is not always possible to see whether a moult is proceeding without raising the old feathers.

The "quill" feathers of the wing and tail are renewed in pairs, so that flight is little, if at all, impaired, the change taking place in the wing from the region of the wrist inwards, as to the primaries, and from the body outwards, towards the tip of the wing, as to the secondaries. In certain birds, however, as in the duck tribe and the rails, for example, all the quill feathers of the wing are shed at once, so that for some time flight is impossible.

In the penguins this simultaneous method of moultng is carried still further. That is to say, the old feathers covering the body are not replaced gradually, but en masse. This method of ecysis is, however, still further remarkable in that the old feathers do not drop out, but are succeeded by spine-like stumps which, later, split at the tip, liberating the bars of the new feathers. They are, on the contrary, thrust out upon the tips of the new feathers, the bars of which are never enclosed within an envelope such as that just described. When their growth has practically completed, and not till then, the old feathers are removed in large patches by the aid of the bird's beak, exposing thereby a perfectly developed plumage. In the cassowary, and emuu, the old feathers similarly adhere for a time to the tips of the new; but in these birds the feathers are moulted singly as in other birds.

Some birds moult twice within the year, the additional moult taking place in the spring, as in the case of the "warblers" (Sylvidae) and Limicola, for example. But when this is the case the spring moult is only partial, since the quill feathers of the wings and the tail feathers are not renewed.

At this spring moult a special "nuptial" plumage is often assumed, as for example in many of the Limicola, e.g. godwits, knots, dunlin, ruff.

The sequel to this habit of assuming a nuptial dress is an interesting one. Briefly, this plumage, at first assumed at the mating period by the males only, and doffed soon after the young appear, has become retained for longer and longer periods, so that the succeeding plumage, often conspicuously dull compared with the nuptial dress, is worn only for a few weeks, instead of many months, as in the case of many of the ducks, for example; and in the case of the males only, and not till then, the old feathers are renewed in large patches by the aid of the bird's beak. This, instead of being worn till the following spring, as in the waders, is shed again in the autumn and replaced by what answers to the wader's "nuptial" dress. In the game-birds but a trace of this "nuptial" plumage remains; and this, apparently, only in jungle-fowl, the common grey partridge (Perdix cinerea) and the blackcock (Lyrurus), in whose case the head and neck for a short period following the breeding season are clothed only by dull feathers. Further, this more highly developed plumage becomes transferred, first to the female, then to the young, so that in many groups, the dull phase of plumage is entirely eliminated.

But the assumption at the breeding season of a conspicuously brilliant plumage is not always due to a moult. In many birds, notably many Passerines, this change is brought about by shedding the tips of the feathers, which are of a duller hue than the rest of the feather. In this way the bright rose pink of the linnet's breast, the blue and black head of the chaffinch, and the black throat and chestnut-and-black markings of the back of the sparrow, are assumed—to mention but a few instances. These birds moult but once a year, in their case the new feathers have broad brown fringes; as the spring advances these drop off, and with them the barbicels from the barbules
of the upper surface of the feather, thus revealing the hidden tints.

According to some authorities, however, some birds acquire a change of colour without a moult by the ascent of pigment from the base of the feather. The black head assumed by many gulls in the spring is, for example, said to be gained in this way.

There is, however, not only no good evidence in support of the contention, but the whole structure of the feather is against the probability of any such change taking place.

Feathers correspond with the scales of reptiles rather than with the scales of fishes, as is shown by their development. They make their first appearance in the developing chick at about the sixth day of incubation, in the shape of small papillae. In section each papilla is found to be made up of layers of epithelial cells — that is to say, of cells of a deeper layer of the skin — capped by cells of the epidermis. These last form a single superficial layer of flattened cells — the epiderchium — overlaying the cells of the Malpighian layer, which are cylindrical in shape and rapidly increase to form several layers. As development proceeds the papillae assume a cone-shape with its apex directed backwards, while the base of this cone sinks down into the skin or rather is pulled down by the growth of the Malpighian layer, so that the cone is now sunk in a deep pit. Thereby these Malpighian cells become divided into two portions: (1) those taking part in the formation of the walls of the pit or "feather follicle," and (2) those enclosed by the pit, which run up the central region of the epidermis. This mass constitutes the nutritive pulp for the development of the growing feather, and is highly vascular. From the Malpighian layer within the cone now becomes differentiated into three layers: (1) an inner, extremely thin, forming a delicate sheath for the pulp, and found in the fully developed feather in the form of a series of hollow, transparent caps enclosing the pulp; (2) a middle layer which becomes the feather itself; and (3) a thin layer which forms the investing sheath of the feather. It is this sheath which gives the curious spine-covered character to many nestling birds and birds in moult. As growth proceeds the cells of this middle layer arrange themselves in longitudinal rows to form the bars, while the barbules are formed by a secondary splitting. At these bases these rudimentary barbs may be seen to join together.

The Malpighian layer, consisting of these three parts, is the foundation of the feather, which during the development of the bird undergoes a very complex change. The feathers of a newly-hatched bird are merely downy pads, much thinner than the adult form, and only a portion of the plumage of the adult bird. This development of the downy and adult feathers is as characteristic of the bird as the development of the seed of a plant.

In its simplest form it runs from the throat backwards in the form of a median band as far as the base of the neck where it divides, sending a branch to each side of the breast. This branch commonly again divides into two, one, broad, outerwards, which lodges the "flank" feathers, and a long, narrow, inner branch which runs backwards to join its fellow of the opposite side in front of the cloacal aperture. This branch lodges the abdominal and a row of neck feathers.

Subsequent portion of the spinal and ventral tracts are generally regarded as separate tracts, the ptil. colis dorsalis and ptil. colis ventralis respectively.

The humeral tract (ptil. humeralis), which gives rise to the "scapular" feathers.

The femoral tract (ptil. femorialis), which forms an oblique band across the thigh.

The crural tract (ptil. cruralis), which clothes the rest of the leg.

The wing tract (ptil. caudalis), including the tail feathers and their coverts; and

The wing tract (ptil. alaris). The wing tract presents many peculiar features. Each segment — arm, fore arm, and hand — bears feathers essential to flight, and these are divided into remiges, or "quill" feathers, and tetrices, or "coverts."

The remiges of the arm, more commonly described as "tertiaries," are, technically, collectively known as the parapteria and hypopteron, and as a whole, as the primary series. They are reduced or absent in some cases, as in the humming-birds, and in others, as in the plover, by the addition of the tertials, which is the "secondaries," the largest and most conspicuous feathers on the bird; in the plover, they are divided into the "primaries," those nearer the hand, and the "secondaries," those farther away. These are, as a rule, much longer and stouter than the remiges, and are reinforced in their central portions by the involvement of the shaft in the form of a solid bony sur-structure, the "hackle," which adds greatly to the strength of the feather.

The shaft of the feather is composed of a series of segments, the quills, which are composed of a single long, strong shaft, in the upper part of which case is inserted in the form of a solid bony structure, the "hackle," which adds greatly to the strength of the feather.

The shaft of the feather is composed of a series of segments, the quills, which are composed of a single long, strong shaft, in the upper part of which case is inserted in the form of a solid bony structure, the "hackle," which adds greatly to the strength of the feather.

The shaft of the feather is composed of a series of segments, the quills, which are composed of a single long, strong shaft, in the upper part of which case is inserted in the form of a solid bony structure, the "hackle," which adds greatly to the strength of the feather.
The first row of the series is formed by the major coverts; these, like the primaries, have their free-edges directed towards the tip of the wing, and are said to have been overlapped, or to have been a part of an after-feather. The second row is formed by the median coverts. These, on the forehead, commonly overlap as to the outer half of the row distally, and as to the inner half proximally. On the hand this series is incomplete. Beyond the median coverts there is a series of covert-like feathers. These may have either a proximal or a distal overlap. The remaining rows of small feathers are known as the marginal coverts, and they all tend to be fan-like.

The three or four large quill-like feathers borne by the thumb form what is known as the "bastard-wing," *ala spuria*.

The coverts of the under follow an arrangement similar to that of the upper wing. In the major and median coverts there will be developed, leaving a more or less bare space which is covered by the great elongation of the marginal series.

One noteworthy fact about the coverts of the under side of the wing is that the marginal and median coverts have what answers to the dorsal surfaces of the feather turned towards the body, and what answers to the ventral surface of the feather turned towards the under surface of the wing. In the major and median covert, however, the ventral surfaces of these feathers are turned ventrally, that is to say, in the extended wing they, like the remiges, have the ventral surfaces turned downwards or towards the body in the closed wing.

But the most remarkable fact in connexion with the pterylosis of the wing is the fact that in all, save the Passerine and Galliform types, and some few other isolated exceptions, the secondary series of feathers is reduced to lack of the mere remiges, and, thus, the wrist inwards, inasmuch as, when such wings are examined, there is always found, in the place of the fifth remex, a pair of major coverts only, while throughout the rest of the series each such pair of coverts either exists or is quill.

This extraordinary fact was first discovered by the French naturalist Z. Gerbe, and was later rediscovered by R. S. Wray, New Zealander, who was able to explain its meaning. This, however, has since been attempted, simultaneously, by P. C. Mitchell and W. P. Pyrcraft. The former has aptly coined the word diastractic to denote the gap in the series, and eulastic to denote such wings as have an uninterrupted series of quills. While both authors agree that there is no evidence of any loss in the number of the quills in diastractic wings, they differ in the interpretation and the conditions under which the primitive and the means by which the gap has been brought about.

According to Mitchell the diastractic is the more primitive condition, and he has conclusively shown a way in which diastractic wings may become eulastic. Pyrcraft on the other hand contends that the diastractic wing has been derived from the eutactic type, and has produced evidence showing, on the one hand, the method by which this transition is effected, and, on the other that by which the diastractic wing may again recover the eutactic condition, though in this last particular the evidence adduced by Mitchell is much more complete. The matter is, however, one of considerable difficulty, and further work is required.

The wings of struthious birds differ from those of the Carinatæae, just described, in many ways. All are degenerate and quite useless as organs of flight. In some cases indeed they have become reduced to mere vestiges.

Those of the ostrich and Rhea are the least degraded.

In the ostrich anxious has prevented the flexion of the hand at the wrist joint so that the quills—primaries and secondaries—form an unbroken series of about forty in number. Of these sixteen belong to the primary or metacarpial-series, a number exceeding that of any other bird. What the significance of this may be with regard to the primitive wing it is impossible to say at present. The coverts, in their disposition, bear a general resemblance to those of Carinatæ wings; but they differ on account of the great length of the feathers and the absence of any definite overlap.

The wings of the South American Rhea more nearly resembles that of flying birds since the hand can be flexed at the wrist joint, and the primaries are twelve in number, as in grebes, and some storks, for example.

The quills, as in the African ostrich, are remarkable for their great length, those representing the major series being as long as the remiges, a fact probably due to the shortening of the latter. They are, however, more or less enclosed in quills, as is the rule among the Carinatæae, but in parallel, transverse rows, in which respect they resemble the owls.

In both ostrich and Rhea, as well as in all the other struthious birds, the young of the female is clothed in soft and downy plumage. The wing of the cassowary, emu and apertyx has undergone complete degeneration; so much so that only a vestige of the hand remains.

Remiges in the casowary are represented by a few spine-like shafts—three primaries and two secondaries. These are really hypertrophied calami. This is shown by the fact that in the nestling these feathers are represented by a normal calamus, which sloughs off, while the calamus becomes enormously lengthened and solid.

In the emu the wing is less atrophied than in the cassowary, but is not yet completely degenerate. Altogether seventeen remiges are represented, of which seven correspond to primaries. Since, however, the other feathers each have an after- shaft as long as the main shaft—like the rest of the body feathers—it may be that they answer not to remiges, but to major coverts.

The wing of apertyx, like that of the cassowary, has become extensively reduced to a few small quills, which answer to the primaries. These feathers are especially interesting, inasmuch as they retain throughout life a stage corresponding to that of the casowary. In the non-feathering calamus, the calamus is greatly swollen, and supporting a much degenerate rhachis and vane.

The penguins afford another object-lesson in degeneration of this kind. Here the wing has become transformed into a paddle, clothed with a covering of small, quill-like feathers. A pollex is wanting, as in the cassowary, emu and apertyx, while it is impossible to say whether remiges are represented or not.

Authors.—The following authors should be consulted for further details on these and other similar birds. For General Reference as to Structure, Colour, Development and Pterylosis.—H. Gadow, in Newton's Dictionary of Birds (1896); W. P. Pyrcraft, "The Interlocking of the Barbs of Feathers," *Natural Science* (1893).

Commercial Applications of Feathers.—The chief purposes for which feathers become commercially valuable may be comprehended under four divisions:—(1) bed and uphostleey feathers; (2) quills for writing; (3) ornamental feathers; and (4) miscellaneous uses of feathers.

Bed and Uphostleey Feathers.—The qualities which render feathers available for stuffing beds, cushions, &c., are lightness, elasticity, freedom from matting and softness. These are combined in the most satisfactory degree in the feathers of the goose and some of several other allied aquatic birds, whose bodies are protected with a warm downy covering. Goose feathers are only used when plucked in the spring or from the young bird, and being at once more elastic, cleaner, and less liable to taint than those obtained from the bodies of killed geese. The down of the elder duck, *Anas mollissima,* is valued above all other substances for lightness, softness and elasticity; but it has some tendency to mat, and is consequently more used for quilts and in articles of clothing than unmixed for stuffing beds. The feathers of swans, ducks and of the common domestic fowl are also largely employed for beds; but in the case of the latter bird, which is of course non-aquatic, the feathers are harsher
and less downy than are those of the notorial birds generally. Feathers which possess strong or stiff shafts cannot without some preliminary preparation be used for stuffing purposes, as the stiff points they present would not only be highly uncomfortable, but would also pierce and cause the escape of the feathers from any covering in which they might be enclosed. The bars are therefore stripped or cut from these feathers, and when so prepared they, in common with soft feathers and down, undergo a careful process of drying and cleaning, without which they would acquire an offensive smell, readily attract dust, and harbour vermin. The drying is generally done in highly heated apartments or stoves, and subsequently the feathers are smartly beaten with a stick, and shaken in a sieve to separate all dust and small debris.

Quills for Writing.—The earliest period at which the use of quill feathers for writing purposes is recorded is the 6th century; and from that time till the introduction of steel pens in the early part of the 19th century they formed the principal writing implements of civilized communities. It has always been from the goose that quills have been chiefly obtained, although the swan, crow, eagle, owl, hawk and turkey all have more or less been laid under contribution. Swan quills, indeed, are better and more costly than are those from the goose, and for fine lines crow quills have been much employed. Only the five outer wing feathers of the goose are useful for writing, and of these the second and third are the best, while left-wing quills are also generally more esteemed than those of the right wing, from the fact that they curve outward and away from the writer using them. Quills obtained in spring, by plucking or otherwise, from living birds are by far the best, those taken from dead geese, more especially if fattened, being comparatively worthless. The use of quills requires to be practiced in the hands of those skilled in the superficial and internal pellicles of skin, and to give the necessary qualities of hardness and elasticity, quills require to undergo some processes of preparation. The essential operation consists in heating them, generally in a fine sand-bath, from 130° to 180° F. according to circumstances, and scraping them under pressure while still soft from heat, whereby the outer skin is removed and the inner shrivelled up. If the heating has been properly effected, the quills are found on cooling to have become hard, elastic and somewhat brittle. While the quills are soft and not so perfectly hard, circumstances requiring designs, and names are easily and permanently impressed on them by pressure with suitable instruments or designs in metal stamps.

Ornamental Feathers.—Feathers do not appear to have been much used, in Europe at least, for ornamental purposes till the close of the 13th century. They are found in the conical caps worn in England during the reigns of Edward III. and Richard II.; but not till the period of Henry V. did they take their place as a part of military costume. Towards the close of the 15th century the fashion of wearing feathers in both civil and military life was carried to an almost ludicrous excess. In the time of Henry VIII. they first appeared in the coats of nobles, and during Elizabeth’s reign feathers began to occupy an important place as head-dress ornaments of women. From that time down to the present, feathers of endless variety have continued to be leading articles of ornamentation in female head-dress; but, except for military plumes, they have long ceased to be worn in ordinary male costume. At the present day, the feathers of numerous birds are, in one way or another, turned to account by ladies for the purpose of personal ornament. Ostrich feathers, however, hold, as they have always held, a pre-eminent position among ornamental feathers; and the ostrich is the only bird which may be said to have been so far cultivated as to be a regular article of commerce, and for the sake of its feathers. Ostrich farming is one of the established industries of South Africa, and is also practised in Kordofan and other semi-desert regions of North Africa, in Argentina, and in Arizona and California in North America. The feathers are generally plucked from the living animal—a process which does not appear to cause any great inconvenience. In the male bird, the long feathers of the rump and wings are white, and the short feathers of the body are jet black; while the rump and wing feathers of the female are white tinged with a dusky grey, the general body colour being the latter hue. The feathers of the male are consequently much more valuable than those of the female, and they are separately classified in commerce. The art of the plumassier embraces the cleaning, bleaching, dyeing, curling and making up of ostrich and other plumes and feathers. White feathers are simply washed in bundles in hot soapy water, run through pure warm water, exposed to sulphurous fumes for bleaching, thereafter bleued with indigo solution, rinsed in pure cold water, and hung up to dry. When dry the shafts are pared or scraped down to give the feathers greater flexibility, and the bars are curled by drawing them singly over the face of a blunt knife or by the cautious application of a heated iron. Dull-coloured feathers are usually dyed black. Feathers which are dyed light colours are first bleached by exposure in the open air. Much ingenuity is displayed in the making up of plumes, with the general result of producing the appearance of full, rich, and long feathers from inferior varieties and from scraps and fragments of ostrich feathers; and so dexterously can factitious plumes be prepared that an experienced person is able to detect the fabrication.

In addition to those of the ostrich, the feathers of certain other birds form articles of steady commercial demand. Among these are the feathers of the South American ostrich, Rhea americana, the marabout feathers of India obtained from Leptoptilus argula and L. javanica, the aigrettes of the heron, the feathers of the various species of birds of paradise, and of numerous species of humming-birds. Swan-down and the skins of various penguins and grebes and of the albatross are used, like fur, for muffles and collarets.

The Chinese excel in the preparation of artificial flowers and other ornaments from bright natural-coloured or dyed feathers; and the French also skilfully work fragments of feathers into bouquets of artificial flowers, imitation butterflies, &c.

Miscellaneous Applications of Feathers.—Quills of various sizes are extensively employed as holders for the sable and camel hair brushes used by artists, &c. Feather brushes and dusters are made from the wing-feathers of the domestic fowl and other birds; those of a superior quality, under the name of vulture dusters, being really made of American ostrich feathers. A minor application of feathers is found in the dressing of artificial fly-keepers; and the pens came into general use it became an object of considerable magnitude to find applications for the supplanted goose-quills, and a large field of employment for them was found in the preparation of toothpicks.

FEATHERSTONE, an urban district in the Osogoldcross parliamentary division of the West Riding of Yorkshire, England, 6 m. E. of Wakefield on the Lancashire & Yorkshire railway. Pop. (1901) 12,933. The industrial population is employed in large collieries in the vicinity; and here, on the 7th of September 1893, serious riots during a strike resulted in the destruction of some of the colliery works belonging to Lord Masham, and were not quelled without military intervention and some bloodshed.

FEATLEY (or FAIRCOUGH) DANIEL (1528-1649), English divine, was born at Charlton, Oxfordshire, on the 15th of March 1528. He was a scholar of Corpus Christi College, Oxford, and probationer fellow in 1602, after which he went to France as chaplain to the English ambassador. For some years he was domestic chaplain to George Abbot, archbishop of Canterbury, and held also the rectories of Lambeth (1610), Allhallows, Bread Street (1612), and Acton (1627), last this after leaving the archbishop’s service in 1625. His varied activities included a “scholastick duel” with James I. in 1625, and the publication of (1) the report of a conference with some Jesuits in 1624, (2) a devotional manual entitled Ancilla Pietatis (1626), (3) Mystica Clavis, a Key opening divers Difficult Texts of Scripture in 70 Sermons (1636). He was appointed provost of Chelsea College in 1630, and in 1641 was one of the sub-committee “to settle religion.” In the course of this work he had a disputation with four Baptists at Southwark which he commemorated in his book
FEBRONIANISM

The name given to a powerful movement within the Roman Catholic Church in Germany, in the latter part of the 18th century, directed towards the “nationalizing” of Catholicism, the restriction of the monarchical power usurped by the papacy at the expense of the episcopate, and the reunion of the dissident churches with Catholic Christendom. It was thus, in its main tendencies, the equivalent of what in France is known as Gallicanism (q.v.). The name is derived from the pseudonym of “Justinus Febronius” adopted by Johann Nikolaus von Honthem (q.v.), coadjutor and successor to the bishop of Treves (Trier), in publishing his work De statu ecclesiae et legitima potestate Romani pontificis. This book, which roused a vast amount of excitement and controversy at the time, exercised an immense influence on opinion within the Roman Catholic Church, and the principles it proclaimed were put into practice by the rulers of that Church in various countries during the latter part of the 18th and the beginning of the 19th century.

The main propositions defended by “Febronius” were as follows. The constitution of the Church is not, by Christ’s institution, monarchical, and the pope, though entitled to a certain precedence, is subordinate to the universal Church. Though as the “centre of unity” he may be regarded as the guardian and champion of the ecclesiastical law, and though he may propose laws, and send legates on the affairs of his primacy, his sovereignty (principatus) over the Church is not one of jurisdiction, but of order and collaboration (ordinis et consociationis). The Roman (ultramontane) doctrine of papal infallibility is not accepted “by the other Catholic Churches” and, moreover, “has no practical utility.” The Church is based on the one episcopacy common to all bishops, the pope being only primus inter pares. It follows that the pope is subject to general councils, in which he is bound to consult his colleagues (conjuratores), not merely his consultors; nor has he the exclusive right to summon such councils. The decrees of general councils need not be confirmed by the pope nor can they be altered by him; on the other hand, appeal may be made from papal decisions to a general council.

As for the rights of the popes in such matters as appeals, reservations, the confirmation, translation and deposition of bishops, these belong properly to the bishops in provincial synods, and were usurped by the papacy gradually as the result of a variety of causes, notably of the False Decretals. For the health of the Church it is therefore necessary to restore matters to their condition before the False Decretals, and to give it its due authority. The main obstacle to this is not the pope himself, but the Curia, and this must be fought by all possible means, especially by thorough popular education (primum adversus absum ecclesiasticae potestatis remedium), and by the assembling of national and provincial synods, the neglect of which is the main cause of the Church’s woes. If the pope will not move in the matter, the princes, and notably the emperor, must act in cooperation with the bishops, summon national councils even against the pope’s will, defy his excommunication, and in the last resort refuse obedience in those matters over which the papacy has usurped jurisdiction.

It will be seen that the views of Febronius had but little originality. In the main they were those that predominated in the great general councils of Constance and Basel in the 15th century; but they were backed by him with such a wealth of learning, and they fitted so well into the intellectual and political conditions of the time, that they found a widespread acceptance. The book, indeed, was at once condemned at Rome (February 1764), and by a brief of the 21st of May the pope commanded all the bishops of Germany to suppress it. The papal condemnation met with a very mixed reception; in some dioceses the order to prohibit the book was ignored, in others action upon it was postponed pending an independent examination, in yet others (nine in all) it was at once obeyed “for political reasons,” though even in these the forbidden book became the “breviary of the governments.” The Febronian doctrine, in fact, exactly fitted the views of the German bishops, which were by no means disinterested. It must be remembered that the bishops were at this time great secular princes rather than Catholic prelates; with rare exceptions, they made no pretence of carrying out their spiritual duties; they shared to the full in the somewhat shallow “enlightenment” of the age. As princes of the Empire they had asserted their practical independence of the emperor; they were irked by what they considered the unjustifiable interference of the Curia with their sovereign prerogatives, and wished to establish their independence of the pope also. In the ranks of the hierarchy, then, selfish motives combined with others more respectable to secure the acceptance of the Febronian position. Among secular rulers the welcome given to it was even less equivocal. Even as devout a sovereign as Maria Theresa refused to allow “Febronius” to be forbidden in the Habsburg dominions; her son, the emperor Joseph II., applied the Febronian principles with remorseless thoroughness. In Venice, in Tuscany, in Naples, in Portugal, they inspired the vigorous efforts of “enlightened despots” to reform the Church from above; and they gave a fresh impetus to the movement against the Jesuits, which, under pressure of the secular governments, culminated in the suppression of the Society by Pope Clement XIV. in 1773. “Febronius,” too, inspired the proceedings of two notable ecclesiastical assemblies, both held in the year 1786. The forming synod which met at Pistoia under the presidency of the bishop, Scipione de’ Ricci, is dealt with elsewhere (see PISTOIA). The other was the so-called congress of Ems, a meeting of the delegates of the four German archbishops, which resulted, on the 25th of August, in the celebrated “Punctuation of Ems,” subsequently ratified and issued by the archbishops. This document was the outcome of several years of controversy between the archbishops and the papal nuncios, aroused by what was considered the unjustifiable interference of the latter in the affairs of the German church. In this the case of Ricci, archbishop of Magdeburg, Cologne and Treves (Trier) had drawn up in thirty articles their complaints against the Curia, and after submitting them to the emperor Joseph II., had forwarded them to the new pope, Clement XIV. These articles, though “Febronius” was prohibited in the archdioceses, were wholly Febronian in tone; and, indeed, Bishop von Honthem himself took an active part in the diplomatic negotiations which were their outcome. In drawing up the “Punctuation” he took no active part, but it was wholly inspired by his principles. It consisted of XXIII. articles, which may be summarized as follows. Bishops have, according to this formulary, the right to hold councils in their dioceses in all matters of dispensation, patronage and the like; papal bulls, briefs, &c., and the decrees of the Roman Congregations are only of binding force in each diocese when sanctioned by the bishop; nunciatures, as hitherto conceived, are to cease; the oath of allegiance to the pope demanded of bishops since Gregory VII.’s time is to be altered so as to bring it into conformity with episcopal annates; and the fees payable for the pallium and confirmation are to be lowered and, in the event of the pallium or confirmation being refused, German archbishops and bishops are to be free to exercise their office under the protection of the emperor; with the Church tribunals of first and second instance (episcopal and metropolitan) the nuncios are not to interfere, and, though appeal to Rome is allowed under certain “national” safe-guards, the opinion is expressed that it would be better to set up in each archdiocese a final court of appeal representing the provincial synod; finally the emperor is prayed to use his influence with the pope to secure the assembly of a national council in order to remove the grievances left unredressed by the council of Trent.

Whether this manifesto would have led to a reconstitution of the Roman Catholic Church on principles of Febronian lines must for ever remain doubtful. The French Revolution intervened; the German Church went down in the storm; and in
1831 the secularizations carried out by order of the First Consul put an end to the temporal ambitions of its prelates. Febronianism indeed, survived. Karl Theodor von Dalberg, prince-primate of the Confederation of the Rhine, upheld its principles throughout the Napoleonic epoch and hoped to establish them in the new Germany to be created by the congress of Vienna. He sent to this assembly, as representative of the German Church, Bishop von Wessenberg, who in his diocese of Constance had not hesitated to apply Febronian principles in reforming, on his own authority, the services and discipline of the Church. But the times were not favourable for such experiments. The tide of reaction after the Revolutionary turmoil was setting strongly in the direction of traditional authority, in religion as in society; the new democratic spirit of the century was not yet mature, and the Church, as the custodian of the old, was already showing signs of vigorous life. Moreover, the great national German Church of which Dalberg had a vision—with himself as primate—did not appeal to the German princes, tenacious of their newly acquired status as European powers. One by one these entered into concordats with Rome, and Febronianism from an aggressive policy subsided into a speculative opinion. As such it survived strongly, especially in the universities (Bonn especially had been, from its foundation in 1774, very Febronian), and it reasserted itself vigorously in the attitude of many of the most learned German prelates and professors towards the question of the definition of the dogma of papal infallibility in 1870. It was, in fact, against the Febronian position that the decrees of the Vatican Council were deliberately directed, and their promulgation marked the triumph of the ultramontane view (see Vatican Council, Ultramontanism, Papacy). In Germany, indeed, the struggle against the papal monarchy was carried on for a while by the governments on the so-called Kulturkampf; the Old Catholics representing militant Febronianism. The latter, however, since Bismarck \(^1\) went to Canossa,\(^2\) have sunk into a respectable but comparatively obscure sect, and Febronianism, though it still has some hold on opinion within the Church in the chapters and universities of the Rhine provinces, is practically extinct in Germany. Its revival under the guise of so-called Modernism grew from Pope Pius X. in 1908, the scathing condemnation embodied in the encyclical Pascendi gregis.

**AUTHORITIES.—See Justinus Febronius, De statu ecclesiæ et legibus ponteficiis Romani pontificis (Bullioni, 1765), second and enlarged edition (2 vols., 1765-71), prefaced by Peter von XIII., to Christian kings and princes, to the bishops of the Catholic Church, and to doctors of theology and canon law; three additional volumes, published in 1772 and 1774 at Frankfort, are devoted to vindications of the origin of the old monastic rights; see especially the critique of Abelard's book, *Revue des deux mondes* for July 1903 (tome xvi. p. 266) is an interesting article under the title of "L'Allemande Catholique," from the pen of the Rev. F. Bau, of the community of the German Carthusians. See also Herzog-Hauck, *Realencylopädie* (Leipzig, 1868), s.v. "Emser Kongress." Further references are given in the article on Honthheim (p. 26). (W. A. P.)

**FEBRUARY,** the second month of the modern calendar. In ordinary years it contains 28 days; but in bisexile or leap year, by the addition of the intercalary day, it consists of 29 days. This month was not in the Romanul calendar. In the reign of Numa two months were added to the year, namely, January at the beginning, and February at the end; and this arrangement was continued until 452 B.C., when the decemvirs placed February before January. The ancient name of Februarius was derived from *februare,* to purify, or from *Februs,* the Roman festival of general expiation and lustration, which was celebrated during the latter part of this month. In February also the Lupercalia were held, and women were purified by the priests of Pan Lyceus at that festival. The Anglo-Saxons called this month *Solmonaht,* because of the return of the sun from the low latitudes. The most generally noted days of February are the following: the 2nd, Candlemas day, one of the fixed quarter days used in Scotland; the 14th, St Valentine's day; and the 24th, St Matthias. The church festival of St Matthias was formerly observed on the 29th of February in bisexile years, but it is now invariably celebrated on the 24th.

**FÉVRE, ALEXANDRE FRÉDÉRIC** (1835- ), French actor, was born in Paris, and after the usual apprenticeship in the provinces and in several Parisian theatres in small parts, was called to the Comédie Française in 1866, where he made his début as Philip II. in *Don Juan d'Autriche.* He soon became the most popular leading man in Paris, not only in the classical répertoire, but in contemporary novelties. In 1894 he toured the principal cities of Europe, and, in 1895, of America. He was also a composer of light music for the piano, and published several books of varying merit. He married Mlle Harville, daughter of one of his predecessors at the Comédie Française, herself a well-known actress.

**FÉCAMP,** a seaport and bathing resort of northern France, 26 m. N.E. of Seine-in-Roumois, 28 m. N.W.E. of Havre on the Western railway. Porc (1906) 12,336. The town, which is situated on the English Channel at the mouth of the small river Fécamp, consists almost entirely of one street upwards of 2 m. in length. It occupies the bottom and sides of a narrow valley opening out towards the sea between high cliffs. The most important building is the abbey church of La Trinité, dating for the most part from 1175 to 1225. The central tower and the south portal (13th century) are the chief features of its simple exterior; in the interior, the decorative work, notably the chapel-screens and some fine stained glass, is remarkable. The hotel-de-ville with a municipal museum and library occupy the remains of the abbey buildings (18th century). The church of St Étienne (16th century) and the Benedictine liqueur distillery, a modern building which also contains a museum, are of some interest. A tribunal and chamber of commerce, a board of trade-merchants and a nautical school, are among the public institutions. The port consists of an entrance channel nearly 400 yds. long leading to a tidal harbour and docks capable of receiving ships drawing 26 ft. at spring-tide, 19 ft. at neap-tide. Fishing for herring and mackerel is carried on and the town equips a large fleet for the coallands of Newfoundland and the fisheries of the coast of Norway. The chief parish church is a Benedictine monastery. King Richard I. greatly enlarged this, and rebuilt the church. The town achieved some prosperity under the dukes of Normandy, who improved its harbour, but after the annexation of Normandy to France it was overshadowed by the rising port of Havre.

**FECHNER, GUSTAV THODOR** (1801-1887), German experimental psychologist, was born on the 19th of April 1801 at Gross-Sächen, near Muskau, in Lower Lusatia, where his father was pastor. He was educated at Sonnau and Dresden and at the university of Leipzig, in which city he spent the rest of his life. In 1824 he was appointed professor of physics, but in 1829 he contracted an affection of the eyes while studying the phenomena of colour and vision, and, after much suffering, resigned. Subsequently recovering, he turned to the study of mind and the relations between body and mind, giving public lectures on the subjects of which his books treat. He died at Leipzig on the 18th of November 1887; among his works may be mentioned: *Das Buchlein vom Leben nach dem Tode* (1836, 5th ed., 1903), which has been translated into English; *Nanna, oder über das Seelenleben der Pflanzen* (1838, 3rd ed., 1893); *Zendavesta, oder* 1

The liqueur is said to have been manufactured by the Benedictine monks of the abbey as far back as 1510; since the Revolution it has been produced commercially by a secular company. The familiar legend D. O. M. (Deco Optimo Maximo) on the bottles preservers the memory of its original makers.
FECHER—FECKENHAM

uber die Dinge des Himmels und des Jenseits (1851, 2nd ed., by Lasswitz, 1901); Über die physikalische und philosophische Atonallehre (1853, 2nd ed., 1864); Elemente der Psychophysik (1800, 2nd ed., 1859); Vorschule der Asthetik (1876, 2nd ed., 1898); Die Tagesansicht gegenüber der Nachtansicht (1879).

He also published chemical and physical works, and translated chemical works by J. B. Biot and L. J. Thénard from the French. A different but essential side of his character is seen in his poems and humorous pieces, such as the Vergleichende Anatomie der Engel (1825), written under the pseudonym of "Dr Mises.

Fechner's epoch-making work was his Elemente der Psychophysik (1860). He starts from the Spinozistic thought that bodily facts and conscious facts, though not reducible one to the other, are different sides of one reality. His originality lies in trying to discover an exact mathematical relation between them.

The most famous outcome of his inquiries is the law known as Weber's or Fechner's law which may be expressed as follows:—

"In order that the intensity of a sensation may increase in arithmetical progression, the stimulus must increase in geometrical progression." Though holding good within certain limits only, the law has been found immensely useful. Unfortunately, from the tenable theory that the intensity of a sensation increases by definite additions of stimulus, Fechner was led on to postulate a unit of sensation, so that any sensation s might be regarded as composed of n units. Sensations, he argued, thus being representable by numbers, psychology may become an "exact" science, susceptible of mathematical treatment. His general formula for getting at the number of units in any sensation is s = \frac{a^n - 1}{a - 1}

where a is the fundamental law governing the experiencer, n is the strength of the stimulus numerically estimated, and c for a constant that must be separately determined by experiment in each particular order of sensibility. This reasoning of Fechner's has given rise to a great mass of controversy, but the fundamental mistake in it is simple. Though stimuli are composite, sensations are not. "Every sensation," says Professor James, "presents itself as an indivisible unit; and it is quite impossible to read any clear meaning into the notion that they are masses of units combined." Still, the idea of the exact measurement of sensation has been a fruitful one, and mainly through his influence on Wundt, Fechner was the father of that new psychology of laboratories which investigates human faculties with the aid of exact scientific apparatus. Though he has had a vast influence in this special department, the disciples of his general philosophy are few. His world-conception is highly animistic. He feels the thrill of life everywhere, in plants, earth, stars, the total universe. Man stands midway between the souls of plants and the souls of stars, who are angels. God, the soul of the universe, must be conceived as having an existence analogous to men. Natural laws are just the modes of the unfolding of God's perfection. In his last work Fechner, aged but full of hope, contrasts this joyous "daylight view" of the world with the dead, dreary "night view" of materialism. Fechner's work in aesthetics is also important. He conducted experiments to show that certain abstract forms and proportions are naturally pleasing to our senses, and gave some new illustrations of the working of aesthetic association. Fechner's position in reference to predecessors and contemporaries is not very sharply defined. He was remotely a disciple of Schelling, learnt much from Herbert and Weisse, and decidedly rejected Hegel and the monadism of Lotze.

FECKENHAM, JOHN (c. 1555–1584), English ecclesiastic, last abbot of Westminster, was born at Feckenham, Worcestershire, of ancestors who, by their wills, seem to have been substantial yeomen. The family name was Howman, but, according to the English custom, Feckenham, on monastic profession, changed it for the territorial name by which he is always known. Learning his letters first from the parish priest, he was sent at an early age to the claustral school at Evesham and thence, in his eighteenth year, to Gloucester Hall, Oxford, as a Benedictine student. After taking his degree in arts, he returned to the abbey, where he was professed; but he was at the university again in 1537 and took his B.D. on the 11th of June 1539. Returning to Evesham he was there when the abbey was surrendered to the king (27th of January 1540); and then, with a pension of £10 a year, he proceeded at once to Oxford, but soon after became chaplain to Bishop Bell of Worcester and then served Bonner in that same capacity from 1543 to 1549.
In 1544 Bonner gave him the living of Solihull; and Feckenham established a reputation as a preacher and a disputant of keen intellect but unvarying charity. About 1549 Cranmer sent him to the Tower of London, and while there “he was borrowed out of prison” to take part in seven public disputations against Hooper, Jewel and others. Released by Queen Mary (5th of September 1553), he returned to Bonner and became prebendary of St Paul’s, rector of Finchley, then of Greenford Magna, chaplain and confessor to the queen, and dean of St Paul’s (10th of March 1554). He took part, with much charity and mildness, in the Oxford disputes against Cranmer, Latimer and Ridley; but he had no liking for the fierce bigotry and bloody measures then in force against Protestants. Feckenham used all his influence with Mary “to procure pardon of the faults or mitigation of the punishment for poor Protestants” (Fuller), and he was sent by the queen to prepare Lady Jane Grey for death. When Elizabeth was sent to the Tower (18th of March 1554), Feckenham interceded for her life and liberty, even at the cost of displeasing the queen.

The royal abbey of Westminster having been restored to its primitive use, Feckenham was appointed abbot, and the old life began again within its hallowed walls on the 21st of November 1556. The abbey school was reopened and the shrine of St Edward restored. On the accession of Elizabeth Feckenham consistently opposed all the legislation for changes in religion, and, when the hour of trial came, he refused the oath of supremacy, rejecting also Elizabeth’s offer to remain with his monks at Westminster if he would conform to the new laws. The abbey was dissolved (12th of July 1559), and within a year Feckenham was sent by Archbishop Parker to the Tower (20th of May 1560), according to Jewel, “for having obstinately refused attendance on public worship, and everywhere declaiming and railing against that religion which we now profess” (Parker Society, first series, p. 79). Henceforth, except for some brief periods when he was a prisoner at large, Feckenham spent the rest of his life in confinement either in some recognized prison, or in the more distasteful and equally rigorous keeping of the bishops of Winchester and Ely. After fourteen years’ confinement, he was released on bail and lived in Holborn, where his benevolence was shown by all manner of works of charity. “He relieved the poor wheresoever he came, so that, as he could not be called either refuse or beggar, he beggars constantly crowded about him” (Fuller). He set up a public aqueduct in Holborn, and a hospice for the poor at Bath; he distributed every day to the sick the milk of twelve cows, took care of orphans, and encouraged manly sports on Sundays among the youth of London by giving prizes.

In 1577 he was committed to the care of Cox of Ely with strict rules for his treatment; and the bishop (1578) could find no fault with him except that “he was a gentle person but in the popish religion too, too obstinate.” In 1580 he was removed to Wisbeach Castle, and there exercised such an influence of charity and peace among his fellow-prisoners that was remembered when, in after years, the notorious Wisbeach Plot broke out under the Jessit Weston. Even here Feckenham found a means of doing public good; at his own cost he repaired the road and set up a market cross in the town. After twenty-four years of suffering for his conscience he died in prison and was buried in an unknown grave in the parish church at Wisbeach on the 16th of October 1581.

The fullest account of Feckenham is to be found in E. Taunton’s *English Black Monks of St Benedict* (London, 1897), vol. i, pp. 192-232.

**FEDCHENKO, ALEXIS PAVLOVICH** (1844-1873), Russian naturalist and traveller, well known for his explorations in central Asia, was born at Irkutsk, in Siberia, on the 7th of February 1844; and, after attending the gymnasiuin of his native town, proceeded to the university of Moscow, for the study more especially of zoology and geology. In 1868 he travelled through Turkestan, the district of the lower Syr-Darya and Samarkand; and shortly after his return he set out for Khokand, where he visited a large portion of territory till then unknown. Soon after his return to Europe he perished on Mont Blanc while engaged in an exploring tour in Switzerland, on the 15th of September 1873.

Accounts of the explorations and discoveries of Feckenho have been published under the Russian government’s *Journey in Turkestan* in 1874, in the *Khanat of Khokand* in 1875, and *Botanical Discoveries in 1876*. See Petermann’s *Mittheilungen* (1872-1874).

**FEDERAL GOVERNMENT** (Lat. *foedus*, a league), a form of government of which the essential principle is that there is a union of two or more states under one central body for certain permanent common objects. In the most perfect form of federation the states agree to delegate to a supreme federal government certain powers or functions inherent in themselves in their sovereign or separate capacity, and the federal government, in turn, in the exercise of those specific powers acts directly, not only on the communities making up the federation, but on each individual citizen. So far as concerns the residue of powers unallotted to the central or federal authority, the separate states retain unimpaired their individual sovereignty, and the citizens of a federation consequently owe a double allegiance, one to the state, and the other to the federal government. They live under two sets of laws, the laws of the state and the laws of the federal government. The word "federation," as distinct from "federation," has been sometimes, though not universally, used to distinguish from such a federal state (*Bundesstaat*) a mere union of states (*Staatenbund*) for mutual aid, and the promotion of interests common to all (see *CONFEDERATION*).

The history of federal government practically begins with Greece. This, however, is due to the fact that the Greek federations are the only ones of which we have any detailed information. The obvious importance, especially to scattered villages or tribes, of systematic joint action in the face of a common danger makes it reasonable to infer that federation in its elementary forms was a widespread device. This view is strengthened by what we can gather of the conditions obtaining in such districts as Aetolia, Acarnania and Samnium, as in modern times among primitive peoples and tribes. The relatively detailed information which we possess concerning the federal governments of Greece makes it necessary to pay special attention to them.

In ancient Greece the most striking tendency of political development was the maintenance of separate city states, each striving for absolute autonomy, though all spoke practically the same language and shared some of the same historical, religious, political, social or economic ties. Such cities as Athens, Sparta, Argos, Corinth, but Greek history is full of examples of small states deliberately sacrificing what must have been obvious commercial advantage for the sake of a precarious autonomy. Such examples as existed of even semi-federal union were very loose in structure, and the selfishness of the component units was the predominant feature. Thus the Spartan hegemony in the Peloponnesian was not really a federation except in the broadest sense. The states did, it is true, meet occasionally for discussion, but their relation, which had no real existence save in cases where immediate common danger, was really that between a paramount leader and unwilling and suspicious allies. The Athenian empire again was a thinly disguised autocracy. The synod (see *DELPHIC LEAGUE*) of the “allies” soon degenerated into a mere form; of comprehensive united policy there was none, at all events after the League had achieved its original purpose of expelling the Persians from Europe.

None the less it is possible, even in the early days of political development in Greece, to find some traces of a tendency towards limited action. Thus the unions of individual villages, known as *syndecisms*, such as took place in Attica and Elis in early times were partly of a federal character: they resulted in the establishment of a common administration, and no doubt in some degree of commercial and military unity. On the other hand, it is likely that these unions lacked the characteristic of federation in that the units could hardly be described as having any sovereign power: at the most they had some municipal autonomy as in the case of the Cleisthenic demes. The union was rather national than federal. As the Amphictyonic unions had one of the
characteristic elements of federation, namely that they were free sovereign states combining for a particular purpose with an elaborate system of representation (see ΑΜΦΙΚΤΥΟΝ). But these unions, at all events in historic times, were mainly concerned with religion, and the authority of the councils did not seriously affect the autonomy of the individual states.

Thus among the city-states as well as among scattered villages the principle of cohesion was not unknown. On the other hand the golden mean between an easily dissoluble relationship, more like an alliance than a federation, and a national system resulting from synoecism was practically never attained in early Greek history. There are, however, examples in Greece proper, and one, Lydia in Asia Minor, of real federal unions. The chief Greek federations were those of Thessaly, Boeotia, Acharnaria, Olynthus, Arcadia, Aetolia, Achaea, the most important as well as the most complete in respect of organization being the Aetolian League and the Achaean League.

1. The Thessalian League originated in the deliberate choice by village aristocracies of a single monarch who belonged from time to time to several of the so-called Heracleid families. Soon after the Persian War this monarchy (dynasty of the Aeoleuca, Herod. v. 63 and vii. 6) disappeared, and in 424 we find Athens in alliance with a sort of democratic federal council representing τὸ κοινὸν ὑπερακόλουθον (cf. Thuc. i. 102, ii. 22, iv. 78), and probably composed of delegates from the towns. The local feudal nobles, however, seem to have put an end to this government by council, and a dictator (ἄρχοντας) was appointed, with authority over the whole military force of the federation. Three such officers, Lycochon, Jason and Alexander, all of Phocaea, endeavoured vainly to administer the collective affairs of the federation, the last by means of a revived republican council. The final failure of this scheme coincided with the disappearance of Thessaly as a sovereign state (see ΤΡΙΣΣΑΛΗ).

2. The form and the history of the Boeotian federation are treated fully under Boeotia (q.v.). It may probably have originated in religious associations, but the guiding power throughout was the imperial policy of Thebes, especially during its short-lived supremacy in Aetolia c. 356 B.C.

3. The federation of Acharnaria is of peculiar interest as being formed by scattered villages or tribes, without settled, still less fortified, habitation. In the early part of the 4th century a κοινὸν τῶν Ἀχαρνῶν met at Stratus (Xen. Hell. iv. 6. 4). Late in the same century towns began to form, without, however, disturbing the federation, which existed as late as the 2nd century B.C., governed by a representative council (βοινάδα), and a common assembly (κοινῶν) at which any citizen might be present.

4. The foundation of the Olynthian federation was due to the need of protection against the northern invaders (see ΟΛΥΝΤΗ). It was in many respects based on liberal principles, but Olynthus did not hesitate to exercise force against recalcitrants such as Acanthus.

5. The 4th century Arcadian league, which was no doubt a revival of an older federation, was the result of the struggle for supremacy between Thebes and Sparta. The defeat of Sparta at Leuctra removed the pressure which had kept separate the Arcadian tribes, and τὸ κοινὸν τῶν Ἀρκαδῶν was established in the new city, Megalopolis (q.v., also ΑΡΚΑΔΙΑ).

6 and 7. The Aetolian and Achaean leagues (see ΑΕΤΟΛΙΑ, and ΑΧΑΕΙΑΝ ΛΑΥΓΟΣ) were in all respects more important than the preceding and constitute a new epoch in European politics. Both belong to a period in Greek history when the great city states had exhausted themselves in the futile struggle against Macedon and Rome, and both represent a conscious popular determination in the direction of systematic government. This characteristic is curious in the Aetolian tribes which were famous in all time for habitual brigandage; there was, however, among them the strong link of a racial feeling. The governing council (τὸ κοινὸν τῶν Λαυγῶν) was the permanent representative body; there was also a popular assembly (παραστάτων), partly of a primary, partly of a representative kind, any one being free to attend, but each state having only one official representative and one vote. Of all the federal governments of Greece, this league was the most certainly democratic in constitution. There was a complete system of federal officers, at the head of whom was a Strategus entrusted with powers both military and civil. This officer was annually elected, and, though the chief executive authority, was strictly limited in the federal deliberations to presidential functions (cf. Livy xxxv. 25, "ne praetor, quum de bello consulisset, ipsa sententiam diceret"). The Achaean League was likewise highly organized; joint action was strictly limited, and the individual cities had sovereign power over internal affairs. There were federal officers, all the military forces of the cities were controlled by the league, and federal finance was quite separate from city finance.

8. Of the Lycian federation, its origin and duration, practically nothing is known. We know of it in 188-186 B.C. as dependent on Rhodes, and, from 168 till the time when the emperor Claudius absorbed it in the provincial system, as an independent state under Roman protection. The federation was a remarkable example of a typical Hellenic development among a non-Hellenic people. Strabo (p. 665) informs us that the federation, composed of twenty-three cities, was governed by a council (κοινὸν συνεδρίου) which assembled from time to time at that city which was most convenient for the purpose in hand. The cities were represented according to size by one, two or three delegates, and bore proportionate shares in financial responsibility. The Lycian league was, therefore, in this respect rather national than federal.

The ancient federal government outside Greece we know very little. The history of Italy supplies a few examples, of which the chief is perhaps the league of the cities of Latium (q.v.; see also ΕΤΡΟΥΣΙΑ).

See E. A. Freeman, Federal Government in Greece and Rome (2nd ed., 1893, J. B. Bury), and works quoted in the special articles.

Among the later European confederations the Swiss republic is one of the most interesting. As now constituted it consists of twenty-two sovereign states or cantons. The government is vested in two legislative chambers, a senate or council of state (Ständerat), and a national council (Nationalrat), constituting jointly the federal assembly (Bundesrat). A federal board (Bundesrat) of seven members elects the president and vice-president for a term of three years (see SWITZERLAND: GOVERNMENT). Before the French Revolution the German empire was a complex federation, with the states divided into electoral colleges, consisting—(1) of the ecclesiastical electors and of the secular electors, including the king of Bohemia; (2) of the spiritual and temporal princes of the empire next in rank to the electors; and (3) of the free imperial cities. The emperor was elected by the first college alone. This imposing confederation came to an end by the conquests of Napoleon; and the Confederation of the Rhine was established in 1806 with the French emperor as protector. But in 1815 the Germanic confederation (Deutscher Bund) was established by the congress of Vienna, which in its turn has been displaced by the present German empire. This, in its new organization, conferred on Germany the long-coveted unity and coherence the lack of which had been a source of weakness. The constitution dates, in its latest form, from the treaties entered into at Versailles in 1871. A federation was then organized with the king of Prussia as president, under the hereditary title of German emperor. Delegates of the various federated governments form the Bundesrat; the Reichstag, or popular assembly, is directly chosen by the people by universal suffrage; and the two assemblies constitute the federal parliament. This body has power to legislate for the whole empire in reference to all matters connected with the army, navy, postal service, customs, coinage, &c., all political laws affecting citizens, and all general questions of commerce, navigation, passports, &c. The emperor represents the federation in all international relations, with the chancellor as first minister of the empire, and has power, with consent of the Bundesrat, to declare war in name of the empire.

The United States of America more nearly resembles the Swiss confederacy, though retaining marks of its English origin. The original thirteen states were colonies wholly independent of each
other. By the Articles of Confederation and Perpetual Union adopted by the Continental Congress in 1777, and in effect in 1781–1789, the states bound themselves in a league of common defence. By the written Constitution, drafted in 1787 and in operation since 1789, a stronger and more centralized union was established—in theory a federal republic formed by the voluntary combination of sovereign states. A common citizenship was recognized for the whole union; but the federal government was to exercise certain powers as were expressly delegated to it (Amendment of 1791). The powers of the central government are entrusted to three distinct authorities—executive, legislative and judicial. The president, elected for a term of four years by electors chosen for that purpose by each state, is the executive head of the republic. The vice-president, ex officio president of the Senate, assumes the presidency in case of resignation or death. Legislative power is vested in a Congress, consisting of two Houses: a Senate, composed of two members elected by each state for a term of six years; and a House of Representatives, consisting of representatives in numbers proportionate to the population of each state, holding their seats for two years. The supreme judicial authority is vested in a Supreme Court, which consists of a chief justice and eight associate justices, all appointed for life by the president, subject to confirmation by the Senate.

The extension of responsible constitutional government by Great Britain to her chief colonies, under a governor or viceregal representative of the crown, has been followed in British North America by the union of the Canadian, maritime and Pacific provinces under a federal government—with a senate, the members of which are nominated by the crown, and a house of commons elected by the different provinces according to their relative population. The governor-general is appointed by the crown for a term of five years, and represents the sovereign in all matters of federal government. The lieutenant-governors of the provinces are nominated by him; and all local legislation is carried on by the provincial parliaments. The remarkable federation of the Dominion of Canada which was thus originated presented the unique feature of a federal union of provinces practically exercising sovereign rights in relation to all local self-government, and sustaining a constitutional autonomy, while cherishing the colonial relationship to Great Britain.

The Commonwealth of Australia (q.v. 1901, p. 283) is another interesting example of self-governing states federating into a united whole. There is, however, a striking difference to be observed in the powers of the federal governments of Canada and Australia. The federal parliament of Canada has jurisdiction over all matters not specially assigned to the local legislatures, while the federal parliament of Australia has only such jurisdiction as is expressly vested in it or is not expressly withdrawn from the local legislatures. This jurisdiction is undoubtedly extensive, comprising among others, power to legislate concerning trade and industry, criminal law, taxation, quarantine, marriage and divorce, weights and measures, legal tender, copyrights and patents, and naturalization and aliens. There was also an early attempt to federate the South African colonies, and an act was passed for that purpose (South African Act 1877), but it expired on the 18th of August 1882, without having been brought into effect by the sovereign in council; in 1908, however, the closer Union movement (see South Africa) ripened, and in 1909 a federating Act was successfully passed.

FEDERALIST PARTY, in American politics, the party that organized the national government of the United States under the constitution of 1787. It may be regarded as, in various important respects, the lineal predecessor of the American Whig and Republican parties. The name Federalists (see Anti-Federalists) was first given to those who championed the adoption of the Constitution. They brought to the support of that instrument "the areas of intercourse and wealth" (Libby), the influence of the commercial towns, the greater planters, the army officers, creditors and property-holders generally,—in short, of interests that had felt the evils of the weak government of the Confederation,—and also of some few true nationalists (few, because there was as yet no general national feeling), actuated by political principles of centralization independently of motives of expediency and self-interest. Most of the Federalists of 1787–1788 became members of the later Federalist Party.

The Federalist Party, which may be regarded as definitely organized practically from 1791, was led, leaving Washington aside, by Alexander Hamilton (q.v.) and John Adams. A pronounced opposition of the new central government to the full extent warranted by a broad construction of the powers granted to it by the constitution, and a correspondingly strict construction of the powers reserved to the states and the citizens, were the basic principles of Hamilton's policy. The friends of individual liberty and local government naturally found in the assumption by the central government of even the minimum of its granted powers constant stimulus to their fears (see Democratic Party); while the financial measures of Hamilton—whose wish for extreme centralization was nowise satisfied by the government actually created in 1787—were calculated to force an immediate and regarding power by that government, to the limit, of every power it could be held to possess. To the Republicans (Democratic Republicans) they seemed intended to cause a usurpation of powers ungranted. Hence these measures became the issues on which the first American parties were formed. Their effect was supplemented by the division into French and British sympathizers; the Republicans approving the aims and condoning the excesses of the French Revolution, the Federalists siding with British reaction against French democracy. The Federalists controlled the government until 1801. They, having the great opportunity of initiative, organized it in all its branches, giving it an administrative machinery that in the main endures to-day; established the doctrine of national neutrality toward European conflicts (although the variance of Federalist and Republican opinion on this point was largely fictitious); and fixed the practice of a liberal construction of the Constitution,—not only by Congress, but above all by the United States Supreme Court, which, under the lead of John Marshall (who had been appointed chief-justice by Pres. John Adams), impressed enduringly on the national system large portions of the Federalist doctrine. These are the great claims of the party to memory. After 1801 it never regained power. In attempts to do so, alike in national and in state politics, it impared its morale by internal dissension, by intrigues, and by inconsistent factious opposition to Democratic measures on grounds of ultra-strict construction. It took up, too, the Democratic weapon of states' rights, and in New England carried sectionalism dangerously near secession in 1808, and in 1812–1814, during the movement, in opposition to the war of 1812, which culminated in the Hartford Convention (see Hartford). It lost, more and more, its influence and usefulness, and by 1817 was practically dead as a national party, although in Massachusetts it lingered in power until 1823. It is sometimes said that Federalism died because the Republicans took over its principles of nationality. Rather it fell because its great leaders, John Adams and Alexander Hamilton, became bitter enemies; because neither was even distantly comparable to Jefferson as a party leader; because the party could not hold the support of its original commercial, manufacturing and general business elements; because the party opposed sectionalism to a growing nationalism on the issues that ended in the war of 1812; and, above all, because the principles of the party's leaders (e.g. of Hamilton) were out of harmony, in various respects, with American ideals. The party then became increasingly a reactionary fear of democracy; indeed, it is not a strict construction of the times to regard the entire Federalist period from the American point of view as reactionary—a reaction against the doctrines of natural rights, individualism, and states' rights, and the financial loosness of the period of the War of Independence and the succeeding years of the Confederation.

The Federalists were charged by the Republicans with being aristocrats and monarchists, and it is certain that their leaders

1 Even the Democratic party has generally been liberal; although less so in theory (hardly less so in practice) than its opponents.
(who were really a very remarkable body of men) distrusted democratic government; that their Sedition Law was outrageous in itself, and (as well as the Alien Law) bad as a party measure; that in disputes with Great Britain they were true English Tories when contrasted with the friendly attitude toward America held by many English Liberals; and that they persisted in New England as a pro-British, aristocratic social-cult long after they lost effective political influence. In short, the country was already thoroughly democratic in spirit, while Federalism stood for obsolete social ideas and was infected with political "Toryism" fatally against the times.

FEDERICI, CAMILLO (1749-1802), Italian dramatist and actor, was born at Garessio, a small town in Piedmont, on the 9th of April 1749. His real name was Giovanni Battista Viassolo, and that by which he is now known and which he transmitted to his children was taken from the title of one of his first pieces, *Camillo e Federico*. He was educated at Turin, and showed at an early age a great fondness for literature and especially for the theatre. The praises bestowed on his early attempts determined his choice of a career, and he obtained engagements with several companies both as writer and actor. He made a happy marriage in 1777, and soon after left the stage and devoted himself entirely to composition. He settled at Padua, and the reputation of his numerous comedies rapidly spread in Italy, and for a time seemed to eclipse that of his predecessors. Most of his pieces were of the melodramatic class, and he too often resorted to the same means of exciting interest and curiosity. He caught, however, something of the new spirit which was manifesting itself in German dramatic literature in the works of Schiller, Iffland and Kotzebue, and the moral tone of his plays is generally healthier. Fortune did not smile upon him; but he found a helpful friend in a wealthy merchant of Padua, Francis Barisan, for whose private theatre he wrote many pieces. He was attacked in 1791 with a dangerous malady which disabled him for several years; and he had the misfortune to see his works, in the absence of any copyright law, published by others without his permission. At length, in 1802, he undertook to prepare a collected edition; but of this four volumes only were completed when he was again attacked with illness, and died at Padua (December 23).

The publication of the works was completed in 14 volumes in 1816. Another edition in 26 volumes was published at Florence in 1826-1827. A biographical memoir of Federici by Neymar appeared at Venice in 1838.

FEE, an estate in land held of a superior lord on condition of the performance of homage or service (see FEUDALISM). In English law "fee" signifies an estate of inheritance (i.e. an estate to which the heir is granted so long as there are any in existence) as opposed to an estate for life. It is divisible into three species: (1) fee simple; (2) conditional fee; (3) fee tail. (See ESTATE.) A fee farm rent is the rent reserved on granting a fee farm, i.e. land in fee simple, to be held by the tenant and his heirs at a yearly rent. It is generally at least one-fourth of the value of the land at the time of its reservation. (See RENT.)

The word "fee" has also the sense of remuneration for services, especially the *honorarium* paid to a doctor, lawyer or member of any other profession. It is also used of a fixed sum paid for a right, title, right to hold, to be held for an examination, or an admission to the fellowship of a university or other society. This sense of the word is taken by the *New English Dictionary* to be due to a use of "fee" in its feudal sense, and to represent a sum paid to the holder of an office "in fee."

The etymology of the Med. Lat. *feudum, feodum or feum*, of its French equivalent *fief*, and English "fee," in Scots law "fee" (q.v.), is extremely obscure. (See the *New English Dictionary*, s.v. "Fee"). There is a common Teutonic word represented in Old English as *fōwe or *fēwe, in Old High German as *fehu, meaning property in the shape of cattle (cf. modern Ger. *Vieh, Dutch *zie). The old Aryan *fēku* gives Sanskrit *paacya, Lat. pecus*, cattle, whence *pecunia*, money. The O. Eng. *feoh*, in the sense of money, possibly survives in "fee," honorarium, though this is not the view of the *New English Dictionary*. The common explanation of the Med. Lat. *feudum or feodum, of which Ducange (*Glossarium*, s.v.) gives an example from a constitution of the emperor Charles the Fat of the year 884, is that it is formed from the Teutonic *fehu*, property, and *dī*, (cf. Althun, and *Udal*). This would apparently restrict the meaning of an original property, while the early applications of *feodum* are to the enjoyment of something granted in return for service (*beneficium*). Another theory takes the origin to be *fehu* alone, in a particular sense of wages, payment for services. This leaves the d- of *feodum* unexplained. Some have taken the origin to be a verbal form *feodare = *feodare dare*. Another theory finds the source in the O. High Ger. *fehbn, to eat, feed upon, "take for one's enjoyment."

FEHLING, HERMANN VON (1812-1883), German chemist, was born at Lübeck on the 9th of June 1853. With the intention of becoming a ship's chemist he entered Heidelberg University about 1853, and after graduating with his doctorate he taught in 1857 at the gymnasium of Oldenburg to Liebig, with whom he elucidated the composition of paraldehyde and metaldehyde. In 1859 on Liebig's recommendation he was appointed to the chair of chemistry in the polytechnic at Stuttgart, and held it all three years of his death, which happened at Stuttgart on the 1st of July 1885. His earlier work included an investigation of succinic acid, and the preparation of phenyl cyanide (benzonitrile), the simplest nitrile of the aromatic series; but later his time was mainly occupied with questions of technology and public health rather than with pure chemistry. Among the analytical methods worked up by him the best known is that for the estimation of sugars by "Fehling's solution," which consists of a solution of cupric sulphate mixed with alkali and potassium-sodium tartrate (Rochelle salt). He was a contributor to the *Handwörterbuch* of Liebig, Wöhler and Poggendorff, and to the Graham-Otto *Textbook of Chemistry*, and for many years was a member of the committee of revision of the *Pharmacopoeia Germanica*.

FEHMANN, an island of Germany, belonging to the Prussian province of Schleswig-Holstein, in the Baltic, separated from the mainland by a narrow channel. Its longest length is 10 sq. miles, and its width 6. It is a gently undulating tract of country, about 120 sq. m. in area, bare of forest but containing excellent pasture-land, and rears cattle in considerable numbers. Pop. 10,000.

FEHMIC COURTS (Ger. *Femgerichte*, or *Vehmgerichte*, of disputed origin, but probably, according to J. Grimm, from O. High Ger. *fême* or *fèime*, a court of justice), certain tribunals which, during the middle ages, exercised a powerful and sometimes sinister jurisdiction in Germany, and more especially in Westphalia. Their origin is uncertain, but is traceable to the earlier Germanic courts known as old Teutonic free courts. They were, indeed, also known as free courts (*Freigerichte*), a name due to the fact that all free-born men were eligible for membership and also to the fact that they claimed certain exceptional liberties. Their jurisdiction they owed to the emperor, from whom they received the power of life and death (*Blutbann*) which they exercised in his name. The sessions were often held in secret, whence the names of secret court (*heimisches Gericht, Stillgericht, &c*); and these the uninitiated were forbidden to attend, on pain of death, which led to the designation of forbidden courts (*verbotene Gerichte*). Legend and romance have combined to exaggerate the sinister reputation of the Fchmic courts; but modern historical research has largely discounted this, proving that they *never* employed torture, that their sittings were only sometimes secret, and that
their meeting-places were always well known. They were, in fact, a survival of an ancient and venerable German institution; and if, during a certain period, they exercised something like a reign of terror over a great part of Germany, the cause of this lay in the sickness of the times, which called for some powerful organization to contend with the growing feudal anarchy. Such an organization the Westphalian free courts, with their discipline of terror and elaborate system of secret service, were well calculated to supply. Everywhere else the power of life and death, originally reserved to the emperor alone, had been usurped by the territorial nobles; only in Westphalia, called "the Red Earth" because here the imperial blood-ban was still valid, were capital sentences passed and executed by the Fehemic courts in the emperor's name alone.

The system, though ancient, began to become of importance only after the division of the duchy of Saxony on the fall of Henry the Lion, when the archbishop of Cologne, duke of Westphalia from 1180 onwards, placed himself as representative of the emperor at the head of the Fehemic. The organization now rapidly spread. Every free man, born in lawful wedlock, and neither excommunicate nor outlaw, was eligible for membership. Princes and nobles were initiated; and in 1429 even the emperor Sigismund himself became "a true and proper Freischöfe of the Holy Roman Empire." By the middle of the 14th century these Freischöfen (Latin scabini), sworn associates of the Fehemic, were scattered in thousands throughout the length and breadth of Germany, known to each other by secret signs and pass-words, and all of them pledged to serve the summons of the secret courts and to execute their judgment.

The organization of the Fehemic was elaborate. The head of each centre of jurisdiction (Freistuhl), often a secular or spiritual prince, sometimes a civic community, was known as the Stuhlherr, the archbishop of Cologne being, as stated above, supreme over all (Oberststuhlherr). The actual president of the court was the Freigräf (free count) chosen for life by the Stuhlherr from among the Freischöfen, who formed the great body of the initiated. Of these the lowest rank were the Freufrosten or Freifroben, charged with the maintenance of order in the courts and the duty of carrying out the commands of the Freigräf. The immense development of the Fehemic is explained by the privileges of the Freischöfen; for they were subject to no jurisdiction but those of the Westphalian courts, whether as accused or accuser they had access to the secret sessions, and they shared in the discussions of the general chapter as to the policy of the society. At their initiation these swore to support the Fehemic with all their powers, to guard its secrets, and to bring before its tribunal anything within its competence that they might discover. They were then initiated into the secret signs by which members recognized each other, and were presented with a rope and with a knife on which were engraved the mystic letters S.S.G.G., supposed to mean Strick, Stein, Gras, Grün (rope, stone, grass, green).

The procedure of the Fehemic courts was practically that of the ancient German courts generally. The place of session, known as the Freistuhl (free seat), was usually a hillock, or some other well-known and accessible spot. The Freigräf and Schöffen occupied the bench, before which a table, with a sword and rope upon it, was placed. The court was held by day and, unless the session was declared secret, all freemen, whether initiated or not, were admitted. The accusation was in the old German form; but only a Freischöfer could act as accuser. If the offence came under the competence of the court, i.e., was punishable by death, a summons to the accused was issued under the seal of the Freigräf. This was not usually served on him personally, but was nailed to his door, or to some convenient place where he was certain to pass. Six weeks and three days' grace were allowed, according to the old Saxon law, and the summons was thrice repeated. If the accused appeared, the accuser stated the case, and the investigation proceeded by the examination of witnesses as in an ordinary court of law. The judgment was put into execution on the spot if that was possible. The secret court, from whose procedure the whole institution has acquired its evil reputation, was closed to all but the initiated, although these were so numerous as to secure quasi-publicity; any one not a member on being discovered was instantly put to death, and the members present were bound under the same penalty not to disclose what took place. Crimes of a serious nature were especially brought before these courts, whose magistrates quizzed the accused and subjected him to a minute examination of every detail of his administration or life. As the nature of the business was for the most part political or judicial investigation—such as heresy and witchcraft—fell within its jurisdiction, as also did appeals by persons condemned in the open courts, and likewise the cases before those tribunals in which the accused had not appeared. The accused if a member could clear himself by his own oath, unless he had revealed the secrets of the Fehemic. If he were one of the uninitiated it was necessary for him to bring forward witnesses to his innocence from among the initiated, whose number varied according to the number on the side of the accuser, but twenty-one in favour of innocence necessarily secured an acquittal. The only punishment which the secret court could inflict was death. If the accused appeared, the sentence was carried into execution at once; if he did not appear, it was quickly made known to the whole body, and the Freischöfe who was the first to meet the condemned was bound to put him to death. This was usually done by hanging, the nearest tree serving for gallows. A knife with the cabalistic letters was left beside the corpse to show that the deed was not a murder.

That an organization of this character should have outlived its usefulness and issued in intolerable abuses was inevitable. With the growing power of the territorial sovereigns and the gradual improvement in the existing courts of justice, the functions of the Fehemic courts were superseded. By the action of the emperor Maximilian and of other German princes they were, in the 16th century, once more restricted to Westphalia, and here, too, they were brought under the jurisdiction of the ordinary courts, and finally confined to mere police duties. With these functions, however, but with the old forms long since robbed of their impressiveness, they survived into the 19th century. They were finally abolished by order of Jerome Bonaparte, king of Westphalia, in 1811. The last Freigräf died in 1835.

Lindner's Der angebliche Ursprung der Fomgerichte aus der Inquisition (Paderborn, 1894); For works in the original see: W. Waiz, Quellenkunde (ed. Leipzig, 1906), p. 401; also ib. supplement vol. (1907), p. 78.

FEHRBELLIN, a town of Germany, in the kingdom of Prussia, on the River Rhine, 40 m. N.W. from Berlin on the railway to Neuruppin. Pop. (1905) 1602. It has a Protestant and a Roman Catholic church and some small industries, among them that of wooden shoes. Fehrbellin is memorable in history as the scene of the famous victory gained, on the 18th of June 1675, by the great elector, Frederick William of Prussia, over the Swedes under Field-Marshal Wrangel. A monument was erected in 1879 on the field of battle, near the village of Hakenberg, to commemorate this great feat of arms.

FEIJÓO Y MONTENEGRO, BENITO JERÓNIMO (1676-1764), Spanish monk and scholar was born at Santa Maria de Melas, near Orense, on the 8th of October 1676. At the age of twelve he entered the Benedictine order, devoted himself to study, and waged war against the superstition and ignorance of his countrymen in the "Teatro crítico (1726-1733)." This indefatigable expositor of a retrograde system called forth embittered protests from narrow-minded patriots like Salvador José Maner, and others; but the opposition was
FEITH—FÉLIX (POPEs)

futile, and Feijóo's services to the cause of knowledge were universally recognized long before his death, which took place at Oviedo on the 26th of September 1764. He was not a great genius, nor a writer of transcendent merit; his name is connected with no important discovery, and his style is undistinguished. But he uprooted many popular errors, awakened an interest in scientific methods, and is justly regarded as the initiator of educational reform in Spain.

FEITH, RHIJNVIS (1753-1824). Dutch poet, was born of an aristocratic family at Zwolle, the capital of the province Overijsel, on the 7th of February 1753. He was educated at Harderwijk and at the university of Leiden, where he took his degree in 1779. In 1772 he settled at his birthplace, and married. In 1785, in the third-seventy year, he became burgomaster of Zwolle. He built a luxurious villa, which he named Boschwijk, in the outskirts of the town, and there he lived in the greatest comfort. His first important production was *Julia*, in 1783, a novel written in emulation of *Werther*, and steeped in Wielandscher and despair. This was followed by the tragedy of *Thirsa* (1784); *Ferdinand and Constantia* (1785), another Werther novel; and *The Patriots* (1784), a tragedy. Bilderdijck and other writers attacked his morbid melancholy, and Johannes Kinker (1784-1820) parodied his novels, but his vogue continued. In 1791 he published a tragedy of *Lady Jane Grey*; in 1792 a didactic poem, *The Grave*, in four cantos; in 1793 *Inez de Castro*; in 1796 the volumes of *Odes and Miscellaneous Poems*; and in 1802 *Old Age*, in six cantos. He died at Zwolle on the 8th of February 1824.

His works were collected (Rotterdam, 11 vols.) in 1824, with a biographical notice by N. G. van Kampen.

FEJÉR, GYÖRGY (1766-1831), Hungarian author, was born on the 23rd of April 1766, at Keszthely, in the county of Zala. He studied philosophy at Pest, and theology at Pressburg; eventually, in 1808, he obtained a theological professorship at Pest University. Ten years later (1818) he became chief director of the educational circle of Raab, and in 1824 was appointed librarian to the university of Pest. Fejér's works, which are nearly all written either in Latin or Hungarian, exceed one hundred and eighty in number. His most important work, *Codex diplomaticus Hungaricae ecclesiasticae ac civilis*, published from 1820 to 1844, in eleven so-called tomes, really exceeds forty volumes. It consists of old documents and charts from A.D. 104 to the end of 1430, and forms an extraordinary monument of patient industry. This work and many others relating to Hungarian national history have placed Fejér in the foremost rank of Hungarian historians. He died on the 2nd of July 1831. His latest works were *A Kunok erevete* (The Origin of the Hun), and *A politikai forradalmak okai* (The Causes of Political Revolutions), both published in 1850. The last production, on account of its liberal tendencies, was suppressed by the Austrian government.

See [Magyar Irók: Életrajz-gyűjtemény (Pest, 1856), and A magyar nemzeti írodalomtörténet vázlata (Pest, 1861)].

FELANITX, or FELANIQUE, a town of Spain, in the south-east of the island of Majorca, Balearic Islands; about 5 m. inland from its harbour, Puerto Colon. Pop. (1900) 11,294. A range of low hills intervenes between Felanitx and the Mediterranean; upon one summit, the Puig de San Sebastian, stands a Moorish castle with a remarkable series of subterranean vaults. From the 3rd century A.C., and possibly for a longer period, earthenware water-cookers and other pottery have been manufactured in the town, and many of the vessels produced are noteworthy for their beauty of form and antiquity of design. There is a thriving trade in wine, fruit, wheat, cattle, brandy, chalk and soap.

FELDKIRCH, a small town in the Austrian province of the Vorarlberg, some 20 m. S. of the S. end of the Lake of Constance. It is situated in a green hollow, on the Ill river, between the two narrow rocky gorges through which it flows out into the broad valley of the Rhine. Hence, though containing only about 4000 inhabitants (German-speaking and Romanist), the town is of great military importance, since it commands the entrance into Tirol from the west, over the Arlberg Pass (5912 ft.), and has been the scene of many conflicts, the last in 1799, when the French, under Oudinot and Masséna, were driven back by the Austrians under Hotze and Jellachich. It is a picturesque little town overshadowed by the old castle of Schanenburg (now a poor-house), built about 1200 by the count of Montfort, whose descendant in 1375 sold it to the Habsburgs. The town contains many administrative offices, and is the residence of a suffragan bishop, who acts as vicar-general of the diocese, the bishop of Brixen. Among the principal buildings are the parish church, dating from 1487, and possessing a "Descent from the Cross" (1521), which has been attributed to Holbein, the great Jesuit educational establishment called "Stella Matutina," and a Capuchin convent and church. There is a considerable amount of transit trade at Feldkirch, which by rail is 11 m. from Buchs (Switzerland), through the principality of Liechtenstein, 24 m. from Innsbruck, and 42 m. from Feldkirch, in Tyrol, and in the Arlberg Pass. The town also possesses numerous industrial establishments, such as factories for cotton-spinning, weaving, bell-founding, dyeing, &c. (W. A. B. C.)

FÉLIBIEN, ANDRÉ (1610-1695), sieur des Avaux et de Javercy, French architect and historiographer, was born at Chartres in May 1619. At the age of fourteen he went to Paris to continue his studies; and in 1647 he was sent to Rome in the capacity of secretary of embassy to the Marquis de Marcell. His residence at Rome he turned to good account by diligent study of its ancient monuments, by examination of the literary treasures of its libraries, and by cultivating the acquaintance of men eminent in literature and in history. Among his most important publications, in the translation of Cardinal Barberini's *Life of Pius V*. Among his friends was Nicholas Poussin, whose counsels were of great value to him. On his return to France he married, and was ultimately induced, in the hope of employment and honours, to settle in Paris. Both Fouquet and Colbert in their turn recognized his abilities; and he was one of the first members (1663) of the Academy of Inscriptions. Three years later Colbert procured him the appointment of historiographer to the king. In 1671 he was named secretary to the newly-founded Academy of Architecture and in 1672 and in 1676, was called to the cabinet of antiquities in the palace of Brion. To these offices was afterwards added by Louvois that of deputy controller-general of roads and bridges. Félibien found time in the midst of his official duties for study and research, and produced many literary works. Among these the best and the most generally known is the *Entretiens sur les vies et sur les ouvrages des plus excellents peintres anciens et modernes*, which appeared in successive livraisons, the first in 1666, and the fifth in 1688. It was re-published with several additions at Amsterdam in 1706, and again at Trévoux in 1725. Félibien wrote also *Origine de la peinture* (1686), *Principes de l'architecture, de la sculpture, de la peinture* (1697-1700), and combinations of the *Histoire de la vie de Paris* in 5 vols., a work indispensable to the student of Paris.

FELIX, the name of five popes.

FELIX I., pope from January 269 until his death in January 274. He has been claimed as a martyr, and as such his name is given in the Roman calendar and elsewhere, but his title to this honour is by no means proved, and he has been probably confused with another bishop of the same name. He appears in connexion with the dispute in the church of Antioch between Paul of Samosata, who had been deprived of his bishopric by the council of bishops for heresy, and his successor Domnus. Paul refused to give way, and in 272 the emperor Aurelian was asked to decide between the
rivals. He ordered the church building to be given to the bishop who was "recognized by the bishops of Italy and of the city of Rome" (Felix). See Eusebius, Hist. Eccl. vii. 30.

Felix II., antipope, was in 356 raised from the archdeaconate of Rome to the papal chair, when Liberius was banished by the emperor Constantius for refusing to subscribe the sentence of condemnation against Athanasius. His election was contrary to the wishes both of the clergy and of the people, and the consecration ceremony was performed by certain prelates belonging to the court. In 357 Constantius, at the urgent request of an influential deputation of Roman ladies, agreed to the release of Liberius on condition that he signed the semi-Arian creed. Constantius also issued an edict to the effect that the two bishops should rule conjointly, but Liberius, on his entrance into Rome in the following year, was received by all classes with so much enthusiasm that Felix found it necessary to retire at once from Rome.

Regarding the remainder of his life little is known, and the accounts handed down are contradictory, but he appears to have spent the most of it in retirement at his estate near Porto. He died in 365.

Felix III., pope, was descended from one of the most influential families of Rome, and was a direct ancestor of Gregory the Great. He succeeded Simplicius in the papal chair on the 2nd of March 483. His first act was to repudiate the Henoticon, a deed of union, originating in opposition to the Arian creed, and published by the emperor Zeno with the view of allaying the strife between the Monophysites and their opponents in the Eastern church. He also addressed a letter of remonstrance to Acacius; but the latter proved refractory, and sentence of deposition was passed against him. As Acacius, however, had the support of the emperor, a schism arose between the Eastern and Western churches, which lasted for 34 years. Felix died in 492.

Felix IV., pope, a native of Ilevenuem, was, on the death of John in 526, raised to the papal chair by the emperor Theodosius in opposition to the wish of that emperor to canonize his father-in-law, Acacius, and published by the emperor Zeno. His election was followed by serious riots. To prevent a recrudescence of these, Felix, on his death-bed, thought it advisable to nominate his own successor. His choice fell upon the archdeacon Boniface (pope as Boniface II.). But this proceeding was contrary to all tradition and roused very serious opposition. Out of two old buildings adapted by him to Christian worship, Felix made the church of SS. Cosimo and Damiano, near the Via Sacra. He died in September 530.

Felix V., the name taken by Amadeus (1385–1451), duke of Savoy, when he was elected pope in opposition to Eugenius IV. in 1439. Amadeus was born at Chambery on the 4th of December 1383, and succeeded his father, Amadeus VII. as count of Savoy in 1391. Having added largely to his patrimonial possessions he became very powerful, and in 1446 the German king Sigismund erected Savoy into a dukedom; after this elevation Amadeus added Piedmont to his dominions. Then suddenly, in 1434, the duke retired to a hermitage at Ripaille, near Thonon, resigning his dukedom to his son Louis (d. 1465), although he seems to have taken some part in its subsequent administration. It is said, but some historians doubt the story, that, instead of leading a life of asceticism, he spent the revenues of his dukedom in luxury and enjoyment. In 1439, when Pope Eugenius IV. was deposed by the council of Basel, Amadeus, although not in orders, was chosen as his successor, and was crowned in the following year as Felix V. In the stormy conflict between the rival popes which followed, the German king, Frederick IV., after some hesitation sided with Eugenius, and having steadily lost ground Felix renounced his claim to the pontificate in 1445 in favour of Nicholas V., who had been elected on the death of Eugenius. He induced Nicholas, however, to appoint him as apostolic vicar-general in Savoy, Piedmont and other parts of his own dominions, and to make him a cardinal. Amadeus died at Geneva on the 7th of January 1451.

Felix, a missionary bishop from Burgundy, sent into East Anglia by Honorius of Canterbury (650–651). Under King Siegbert his mission was successful, and he became first bishop of East Anglia, with a see at Dunwich, where he died and was buried, 647–648. It is noteworthy that the Irish monk Furseus preached in East Anglia at the same time, and Bede notices the admiration of Felix for Aídan.

See Bede, Hist. Eccl. (Plummer), ii. 13, 18, 20, 25; Saxon Chronicle (Earle and Plummer), s. a. 636.

Felix, of Urgella, (fl. 8th century), Spanish bishop, the friend of Eilipandus and the propagator of his views in the great Adoptionist Controversy (see ADOPTIONISM).

Felix, of Valois (1127–1212), one of the founders of the monastic order of Trinitarians or Redemptionists, was born in the district of Valois, France, on the 19th of April 1127. In early manhood he became a hermit in the forest of Galereuse, where he remained till his sixty-first year, when his disciple Jean de Matha (1160–1213) suggested to him the idea of establishing an order of monks who should devote their lives to the redemption of Christian captives from the Saracens. They journeyed to Rome about the end of 1197, obtained the sanction of the pope, and on their return to France founded the monastery of Cerdroi in Picardy. Felix remained to govern and propagate the order, while Jean de Matha superintended the foreign journeys. A subordinate establishment was also founded by Felix in Paris near a chapel dedicated to St Mathurin, on which account his monks were also called St Mathurins.

He died at Cerdroi on the 4th of November 1198. His feast is kept on the 19th of April.

FELIXANTONIUS, Roman procurator of Judea (A.D. 52–60), in succession to Ventidius Cumanus. He was a freedman either of the emperor Claudius—according to which theory Josephus (Antiq., xx. 7) calls him Claudius Felix—or more probably of the empress Antonia. On entering his province he induced Drussila, wife of Aazius of Iemos (Emesa), to leave her husband and live with him as his wife. His cruelty and licentiousness, coupled with his accessibility to bribes, led to a great increase of crime in Judea. To put down the zealots he contrived an even more violent scene, the infamous "Dagger-plot", by which he induced the murder of the high-priest Jonathan. The period of his rule was marked by internal feuds and disturbances, which he put down with severity. The apostle Paul, after being apprehended in Jerusalem, was sent to be judged before Felix at Caesarea, and kept in custody for two years (Acts xxiv.). On returning to Rome, Felix was accused of having taken advantage of a dispute between the Jews and Syrians of Caesarea to slay and plunder the inhabitants, but through the intercession of his brother, the freedman Pallas, who had great influence with the emperor Nero, he escaped punishment. See Bede, Hist. Eccl. iv. 54, Hist. v. 9; Suetonius, Claudius, 28; E. Schürer, History of the Jewish People (1890–1891); article in Hastings' Dict. of the Bible (A. Robertson); commentaries on the New Testament; Spitta, History of the Church; St Paul the Traveler; Carl v. Weizäcker, Apostolic Age (Eng. trans., 1894); art. JEWS.

FÉLIX, LIA (1830– ) French actress, was the third sister and the pupil of the great Rachel. She had hardly given any trial when, by chance, she was called on to create the leading woman's part in Lamartine's Tousignant Lionwurte at the Porte St Martin on the 6th of April 1830. The play did not make a hit, but the young actress was favourably noticed, and several important parts were immediately entrusted to her. She soon came to be recognized as one of the best comediennes in Paris. Rachel took Lia to America with her to play second parts, and on returning to Paris she played at several of the principal theatres, although her health compelled her to retire for several years. When she reappeared at the Guéret in the title rôle of Jules Barbier's Jeanne d'Arc she had an enormous success.

FELIXSTOWE, a seaside resort of Suffolk, England; fronting both to the North Sea and to the estuary of the Orwell, where there are piers. Port of urban district of Felixstowe and Walton. It is 85 m. N.E. by E. from London by a branch line from Ipswich of the Great Eastern railway; and is in the Woodbridge parliamentary division of the county. It has good golf links, and is much frequented by visitors for its bracing climate and sea-bathing. There is a small dock, and phosphate of lime is extensively dug in the neighbourhood and
imported for use as manure. The neighbouring village of Walton, a short distance inland, receives many visitors. The vicinity has yielded numerous Roman remains, and there was a Roman fort on the neighbourhood (now destroyed by the sea), forming part of the coast defences of the Litus Saxonicum in the 4th century.

**FELL, JOHN** (1625-1686), English divine, son of Samuel Fell, dean of Christ Church, Oxford, was born at Longworth in Berkshire and received his first education at the free school at Thame in Oxfordshire. In 1636 he obtained a studentship at Christ Church, and in 1640 he was specially allowed by Archbishop Laud on account of his "known desert," when wanting one term's residence, to proceed to his degree of B.A. He obtained his M.A. in 1643 and took holy orders (deacon 1647, priest 1649). During the Civil War he bore arms for the king and held a commission as ensign. In 1648 he was deprived of his studentship by the parliamentarian visitors, and during the next few years he resided chiefly at Oxford with his brother-in-law, Dr T. Willis, at whose house opposite Merton College he and his friends Alstree and Dollen kept up the service of the Church of England through the Commonwealth.

At the Restoration Fell was made prebendary of Chichester, canon of Christ Church (July 27, 1660), dean (Nov. 30), master of St Oswald's hospital, Worcester, chaplain to the king, and D.D. He filled the office of vice-chancellor from 1666 to 1669, and was consecrated bishop of Oxford, in 1676, retaining his deanery in commendam. Some years later he declined the primacy of Ireland. Fell showed himself a most capable and vigorous administrator in his various high employments, and a worthy disciple of Archbishop Laud. He restored in the university the good order instituted by the archbishop, which in the Commonwealth had given place to anarchy and a general disregard of authority. He ejected the intruders from his college or else "fixed them in loyal principles." "He was the most zealous man of his time for the Church of England," says Wood, "and none that I yet know of did go beyond him in the performance of the rules belonging thereunto." He attended chapels of ease times, and was never without Lydia, his assiduous organ and surplice, and insisted on the proper academical dress which had fallen into disuse. He was active in recovering church property, and by his directions a children's catechism was drawn up by Thomas Marshall for use in his diocese. "As he was among the first of our clergy," says Burnet, "that apprehended the design of bringing in popery, so he was one of the most zealous against it." He was forward in making converts from the Roman Catholics and Nonconformists. On the other hand, it is recorded to his honour that he opposed successfully the incorporation of Titus Oates as D.D. in the university in October 1679; and according to the testimony of William Nichols, his secretary, he disapproved of the Exclusion Bill. He excluded the undergraduates, whose presence had been irregularly permitted, from convocation. He obliged the students to attend lectures, instituted reforms in the performances of the public exercises in the schools, kept the examiners up to their duties, and himself attended the examinations. He encouraged the students to act plays. He entirely suppressed "coursing," i.e. disputations in which the rival parties "ran down opponents in arguments," and which commonly ended in blows and disturbances. He was an excellent disciplinarian and possessed a special talent for the education of young men, many of whom he received into his own family and watched over their progress with paternal care. Tom Browne, author of the *Dialogues of the Dead*, about to be expelled from Oxford for some offence, was pardoned by Fell on the condition of his translating extemore the 33rd epigram from Martial:

> Non ame, Sabid, nec possum dicere quare;<br>hoc tum petens extemore spectat esse mere.<br>Speechless, I must extemore the 33rd epigram from Martial:

To which he immediately replied with the well-known lines:

> I do not love you, Dr Fell,<br>But why, I cannot tell;<br>But this I know well, I do not love you, Dr Fell."

---

Delinquents, however, were not always treated thus mildly by Fell, and Acton Cremer, for the crime of courting a wife while only a bachelor of arts, was set as an imposter the translation into English of the whole of Scheffer's history of Lapland. As vice-chancellor, Fell himself visited the drinking taverns and ordered out the students. In the university elections he showed great energy in suppressing corruption.

Fell's building operations almost rivalled the plans of the great ecclesiastical architects of the middle ages. In his own college he completed in 1665 the north side of Wosley's great quadrangle, already begun by his father but abandoned during the Commonwealth; he rebuilt in 1672 the east side of the Chaplain's quadrangle with a straight passage under it leading from the cloister into the field, occupied now by the new Banbury Buildings; the lodges of the canal of the 3rd stall in the passage under the field was added in 1670 (c. 1674); a long building joining the Chaplain's quadrangle on the east side in 1672-1678; and lastly the great tower gate, begun in June 1681 on the foundation laid by Wosley and finished in November 1682, to which the bell "great Tom," after being recast, was transferred from the cathedral in 1683. In 1670 he planted and laid out the Broad Walk. He spent large sums of his own on these works, gave £500 for the restoration of Banbury church, erected a church at St Oswald's, Worcester, and the parsonage house at Woodstock at his own expense, and rebuilt Cuddesdon palace. Fell disapproved of the use of St Mary's church for secular purposes, and pronouncing the building of the Sheldonian theatre by Archbishop Sheldon. He was treasurer during its construction, presided at the formal opening on the 9th of July 1669, and was nominated with Wren curator in July 1670. In the theatre was placed the University Press, the establishment of which had been a favourite project of Laud, which now engaged a large share of Fell's energy and attention, and which as curator he practically controlled. "Were it not you Mr Dean extraordinarily well," writes Sir L. Jenkins to J. Williamson in 1672, "it were impossible to imagine how anything soidious and drudgingly he is about his work." He sought for type and printers from Holland, declaring that "the foundation of all success must be laid in doing things well, which I am sure will not be done with English letters." Many works, including a Bible, editions of the classics and of the early fathers, were produced under his direction and editing, and his press became noted not only in England but abroad. He published annually one work, generally a classical author annotated by himself, which he distributed to all the students of his college on New Year's day. On one occasion he surprised the Press in printing surreptitiously Aretino's *Postures*, when he seized and destroyed the plates and impressions. Even "an eager defender and maintainer of the university and its privileges," he was hostile to the Royal Society, which he regarded as a possible rival, and in 1686 he gave an absolute refusal to Obadiah Walker, afterwards the Roman Catholic master of University College, though licensed by James II., to print books, declaring he would as soon "part with his bed from under him" as his press. He conducted it on strict business principles, and to the criticism that more great works were not produced replied that they would not sell. He was, however, not free from fads, and his new spelling (of which he is the originator) has been the subject of *i* for *y* in such words as *des, dates, maist*, which is greatly disapproved.

Fell also did much to encourage learning in the university. While still a young man at Christ Church he had shown both his zeal and his charity by reading gratuitously with the poor and neglected students of the college. He bore himself a high reputation as a Grecian, a Latinist and a philologist, and he found time, in spite of his great public employments, to bring out with the collaboration of others his great edition of St Cyprian in 1682, an English translation of The *Unity of the Church* in 1681, editions of *Nemesius of Euses* (1671), of *Aristus and of Eratosthenes* (1673), of *Theocritus* (1750), *Alcman on Plato* (1677), *St Clement's Epistles to the Corinthians* (1677), *Athenagoras* (1683), *Clemens Alexandrinus* (1683), *St Theophilus of Antioch* (1684),

FELL, JOHN

Grammatica rationis sive institutiones logicae (1673 and 1685), and a critical edition of the New Testament in 1675. The first volumes of Rerum Anglicarum scriptores and of Historiae Britannicae, &c. were compiled under his patronage in 1684. He had the MSS. of St. Augustine in the Bodleian and other libraries at Oxford generously collated for the use of the Benedictines at Paris, then preparing a new edition of the father.

Fell spent such large sums in his building, in his noble patronage of learning, and in charities, that sometimes there was little left for his private use. Occasionally in his schemes he showed greater zeal than prudence. He was the originator of a mission to India which was warmly taken up by the East India Company. He undertook himself to train as missionaries four scholars at Oxford, procured a set of Arabic types, and issued from these the Gospels and Acts in the Malay language in 1677. But this was scarcely the best method of communicating the gospel to the natives of India, and the mission collapsed. He affected to despise public opinion, and was masterful and despotic in his dealings with others, especially with those upon whom he was conferring favours. Having generously undertaken at his own charge to publish a Latin version of Wood's History and Antiquities of the University of Oxford, with the object of presenting the history of the university in a manner worthy of the great subject to European readers, and of extending its fame abroad, he arrogated to himself the right of editing the work. "He would correct, or, at least, make what pleases him," and "would have disposed the work to great advantage and carried all things at his pleasure." In particular he struck out all the passages which Wood had inserted in praise of Hobbes, and substituted some disparaging epithets. He called the philosopher's Leviathan "monstruosissimum" and "publico damned notissimum." To the printed remonstrance of Hobbes, Fell inserted an insulting reply in the History to "irritabile illud et vanissimum Malmesburiense animal," and to the complaint of Wood at this usage answered only that Hobbes "was an old man, had one foot in the grave; that he should mind his own business, and not trouble the learned with any more of his papers." In small things as in great he loved to rule and direct.

"Let not Fell," writes R. South to R. Bathurst, "have the fingerling and altering of them (i.e. his Latin verses), for I think that, bating the want of sicutemis and quicletiam, they are as good as his Worship can make." Wood styles him "a valde vult person." He was not content with ruling his own college, but desired to govern the whole university. He prevented Gilbert Ironsides, who "was not pliable to his humour," from holding the office of vice-chancellor. He "endeavoured to carry all things by a high hand; scorn'd in the least to court the Masters when he had to have anything past the conversation; sent him to other colleges, blind as to his own, very partial and with good words, and flatterers and tell-tales could get anything out of him." According to Bishop Burnet, who praises his character and his administration, Fell was "a little too much heated in the matter of our disputes with the dissenters." "He had much zeal for reforming abuses, and managed it perhaps with too much heat and in too peremptory a way."

"But," he adds, "we have so little of that among us that no wonder if such men are censured by those who love not such patterns nor such severe task-masters. And Wood was uniformly described in a little account on the personal dispute,—after declaring that Fell was "exceeding partial in his government even to corruption; went thro' thick and thin; grasped at all yet did nothing perfect or effectually; cared not what people said of him, was in many things very rude and in most pedantic and pedagogical," concludes with the acknowledgment, "yet still aimed at the public good." Roger North, who paid Fell a visit at Oxford, speaks of him in terms of enthusiasm:

"The great Dr Fell, who was truly great in all his circumstances, capacities, undertakings and learning, and above all for his superabundant public spirit and goodwill. O the felicity of that age and place when his authority swayed!"

In November 1684, at the command of the king, Fell deprived Locke, who had incurred the royal displeasure by his friendship with Shaftesbury, and was suspected as the author of certain seditious pamphlets, of his studentship at Christ Church, summarily and without hearing his defence. Fell had in former years cultivated Locke's friendship, had kept up a correspondence with him, and in 1663 had written a testimonial in his favour; and the ready compliance of one who could on occasion offer a stout resistance to any invasion of the privileges of the university has been severely criticised. It must, however, be remembered in extenuation that the legal status of a person on the foundation of a collegiate body had not then been decided in the law-courts. With regard to the justice of the proceeding Fell had evidently some doubts, and he afterwards expressed his regret for the step which he now compelled to take. But such scruples, however strong, would, with a man of Fell's political and religious opinions, yield immediately to an order from the sovereign, who possessed special authority in this case as a visitor to the college; and such subservience, however strange to modern notions, would probably only be considered natural and proper at that period.

Fell, who had never married, died on the 10th of July 1686, worn out, according to Wood, by his overwhelming public duties. He was buried in the divinity chapel in the cathedral, below the seat which he had so often occupied when living, where a monument and an epitaph, now moved elsewhere, were placed to his memory. "His death," writes John Evelyn, "was an extraordinary loss to the poor church at this time;" but for himself Fell was fortunate in the time of his departure; for in a few months more of life would have necessitated a choice, most painful to a man of his character and creed, between fidelity to his sovereign and to his church. With all his faults, which were the defects which often attend eminent qualities such as his, Fell was a great man, "the greatest governor," according to Speaker Onslow, "that has ever been since his time in either of the universities," and of his own college, to which he left several exhibitions for the maintenance of poor scholars, he was a second founder. He was a worthy upholder of the Laudian Church, and as long as he lived he maintained a protestation of the communion of the Church of England, and a man of exemplary morals and great piety who remained unsullied in the midst of a busy life and much contact with the world. A sum of money was left by John Cross to perpetuate Fell's memory by an annual speech in his praise, but the Fellii laudes have been discontinued since 1686. There are two interesting pictures of Fell at Christ Church, one where he is represented with his two friends Allestree and Doblen, and another by Vandyck. The statue placed on the N.E. angle of the Great Quadrangle bears no likeness to the bishop, who is described by Hearne as a "thin grave man."

The authorized biographer of Fell, the Rev. J. Dolben, wrote the lives of his friends Dr Henry Hammond (1661), Richard Allestree, prefixed to his edition of the latter's sermons (1684), and Dr Thomas Willis, in Latin. His Seasonable advice to Protestants showing the necessity of maintaining the Established Religion in opposition to Popery was published in 1688. Some of his sermons, which Evelyn found dull, were printed, including Character of the Last Days, preached before the king, 1675, and a Sermon preached before the House of Peers Dec. 22, 1680. The Interest of England stated (1699), advocating the restoration of the king, and The critical examination of the Vindicta Verdiana (1704) are addressed to him. Fell probably had some share in the composition of The Whole Duty of Man, and in the subsequent works published under the name of the author of The Whole Duty, which included Reasons of the Decay of Christian Piety, The Ladies Calling, The Gentleman's Calling, The Government of the Tongue, The Art of Contentment, and The Lively Oracles given us, all of which were published in one volume with notes and a preface by Fell in 1684.

FELL—FELLER

University by Dr J. F. (1695); Notes and Queries, ser. vi. 2, and ser. vii. 166; Calendars of State Papers, Dom. Series (1660-1675). Fell's books and papers were bequeathed by his nephew Henry Jones to the Bodleian library. A few of his letters are to be found in Add. MSS. Brit. Mus. 110, 1650s, and some are printed in Life of James II., by Ch. J. Fox, Appendix; Gent. Mag. 77, p. 633: Academy, 8, p. 141; Athenaeum for 1887 (2), p. 311; J. Gutch, Collectanea Curiosa, i, 269; and in Cal. of State Papers, Dom. Series. (F. C. Y.)

FELL. (1) Through the O. Fr. fe, from Low Lat. fella, felon), savage, ruthless, deadly; only used now in poetry. (2) (Of Scandinavian origin, cf. Danish feld, probably connected with a Teutonic root appearing in German fels, rock), a hill, as in the names of mountains in the Lake District in England, e.g. Scawfell; also a lofty moorland down. (3) (A word used to Teutonic languages, cf. Ger. fell, and Dutch veld, cognate with Lat. pellis, skin), the pelt or hide of an animal, with the hair or wool and skin; also used of any thick shaggy covering, like a matted fleece. (4) To cause to 'fall,' a word common to Teutonic languages and akin to the root of the Lat. fullere and Gr. φυλλανειν, to cause to stumble, to deceive. As a substantive 'fell' is used of a flat seam laid level with the surface of the fabric; also, in weaving, of the end of the web.

FELLAH (pl. Fellahin), Arabic for 'ploughman' or 'tiller,' the word used in Arabic-speaking countries to designate peasants. It is employed especially of the peasantry of Egypt and Morocco. 'Fellahin' in modern English usage being almost equivalent to 'Egyptians.' In Egypt the name is applied to the peasantry as opposed to the Arabs of the desert (and even those who have settled on the land), the Turks and the townfolk. Fellah is used by the Arabs as a term of reproach, somewhat like the English 'boor,' but rather implying a slavish disposition; the fellahin, however, are not ashamed of the name and may pride themselves on being of good fellah descent, as a 'fellah of a fellah.' They may be classified as Hamito-Semitic, and preserve to some extent the blood of the ancient Egyptians. They form the bulk of the population of Egypt and the mainly Mahomedan, though some villages in Upper Egypt are almost exclusively Copt (Christian). Their hybridism is well shown by their great divergence of colour, fellahin in the Delta being sometimes lighter than Arabs, while in Upper Egypt the prevailing complexion is dark brown. The average fellah is somewhat above medium height, big-boned, of clumsy but powerful build, with head and face of oval shape, cheek-bones high, forehead broad, short flattish nose with wide nostrils, and black but not woolly hair. The eyebrows are always straight and smooth, never bushy. The mouth is thick-lipped and large but well formed. The eyes are large and black, and are remarkable for the closeness of the eyelashes. The women and girls are particularly noted for their graceful and slender figures and their fine carriage, due to the custom of carrying burdens, especially water-jars, on their heads. The men's heads are usually shaved. The women are not as a rule closely veiled: they generally paint the lips a deep blue, and tattoo a floral device on the chin, sometimes on the forehead and other parts of the body. All but the poorest wear necklaces of cheap pearls, coins or gilt disks. The men wear a blue or brown cotton shirt, linen drawers and a plain skull-cap, or on occasion the turban or fez. Many fellahin wear the turban, and the women wear a single cotton smock. The common fellah's home is a mere mud hut, roofed with durra straw. Inside are a few mats, a sheepskin, baskets and some earthenware and wooden vessels. He lives almost entirely on vegetables, millet bread, beans, lentils, dates and onions. But some of the shekhs are wealthy, and have large houses built of crude brick and whitewashed with lime, with courtyard, many apartments and good furniture. The fellah is laborious in the fields, and abominates absence from his occupations, which generally means loss of money to him. Military service on the old oriental plan was both ruinous and disastrous to him; hence voluntary mutilations to avoid conscription were formerly common and the ingrained prejudice against military service remains. Trained by British officers, the fellahin make, however, excellent soldiers, as was proved in the Sudan campaigns of 1896-98. The fellah is intelligent, cheerful and sober, and as hospitable as his poverty allows. (See COPTS and EGYPT.)

FELLENBERG, PHILIPP EMANUEL VON (1771-1844), Swiss educationist, was born on the 27th of June 1771 at Bern, in Switzerland. His father was of patrician family, and a man of importance in his canton, and his mother was a granddaughter of the Dutch admiral van Tromp. From his mother and from Pfeiffer, the blind poet of Colmar, he received a better education than falls to the lot of most boys, while the intimacy of his father with Pestalozzi gave to his mind that bent which it afterwards followed. In 1790 he entered the university of Tübingen, where he distinguished himself by his rapid progress and his ability to learn languages. He then took a walking tour in Switzerland and the adjoining portions of France, Swabia and Tirol, visiting the hamlets and farmhouses, mingling in the labours and occupations of the peasants and mechanics, and partaking of their rude fare and lodging. After the downfall of Robespierre, he went to Paris and remained there long enough to be assured of the storm impending over his native country. This he did his best to avert, but his warnings were disregarded, and Switzerland was lost before any efficient means could be taken for its safety. Fellenberg, who had hastily raised a levy en masse, was proscribed; a price was set upon his head, and he was compelled to fly into Germany. Shortly afterwards, however, he was recalled by his countrymen, and sent on a mission to Paris to reconcile the national party. He was received with the greatest intimacy and respect by the leaders of the French republic. But in this and other diplomatic offices which he held for a short time, he was witness to so much corruption and intrigue that his mind revolted from the idea of a political life, and he returned home with the intention of devoting himself wholly to the education of the young. With this resolution he purchased in 1799 the estate of Hofwil, near Bern, intending to make agriculture the basis of a new system which he had projected, for elevating the lower and rightly training the higher orders of the state, and welding them together in a closer union than had hitherto been deemed attainable. For some time he carried on his labours in conjunction with Pestalozzi, but incompatibility of disposition soon induced them to separate. The scheme of Fellenberg at first excited a large amount of ridicule, but gradually it began to attract the notice of foreign countries; and pupils, some of them of the highest rank, began to flock to him from every country in Europe, both for the purpose of studying agriculture and to profit by the high moral training which he associated with his educational system. For forty-five years Fellenberg was assisted by his wife, continued his educational labours, and finally raised his institution to the highest point of prosperity and usefulness. He died on the 21st of November 1814.

See Hamm, Fellenberg's Leben und Wirken (Bern, 1845); and Schonl, Der Stifter von Hofwil, Leben und Wirken Fellenberg's.

FELLER, PRAÇO dr Xavier de (1735-1802), Belgian author, was born at Brussels on the 18th of August 1755. In 1772 he entered a school of the Jesuits at Reims, where he manifested a great aptitude for mathematics and physical science. He commenced his novitiate two years afterwards, and in testimony of his admiration for the apostle of India added Xavier to his surname. On the expiry of his novitiate he became professor at Luxembourg, and afterwards at Liège. In 1764 he was appointed to the professorship of theology at Tyrvau in Hungary, but in 1771 he returned to Belgium and continued to discharge his professorial duties at Liège till the suppression of the Jesuits in 1773. The remainder of his life he devoted to study, travel and literature. On the invasion of Belgium by the French in 1794 he went to Paderborn, and remained there two years, after which he took up his residence at Ratisbon, where he died on the 23rd of May 1802.

Feller's works exceed 120 volumes. In 1773 he published, under the assumed name Flexier de Reval (an anagram of Xavier de Feller), his Cathédrales philosophique; and his principal work, Dictionnaire historique et litteraire (published in 1778 at Liège in 8 volumes, and afterwards several times reprinted and continued
down to 1838), appeared under the same name. Among his other works the most important are *Cours de morale chrétienne et de littéra- ture religieuse* and *Le Coup d’œil sur les États-Unis*. *Lettres historiques et littéraires*, published at Luxembourg and Liège from 1774 to 1794 in 70 volumes, was edited and in great part written by him.

**FELLING**, an urban district in the Jarrow parliamentary division of Durham, England, forming an eastern suburb of Gateshead. Pop. (1901) 22,457. Its large industrial population is employed in the neighbouring collieries and the various attendant manufactures.

**FELLOE**, the outer rim of a wheel, to which the spokes are attached. The word is sometimes spelled and usually pronounced "felly." It is a Teutonic word, in O. Eng. felge, cognate with Dutch elge, Ger. Felge; the original Teutonic root from which the word is derived was probably *mōn,* "to fit together.

**FELLOW,** properly and by origin a partner or associate, hence a companion, comrade or mate, as in "fellow-man," "fellow-countryman," &c. The word from the 15th century has also been applied, generally and colloquially, to any male person, often in a contemptuous or pitying sense. The Old English *fellage* meant a partner in a business, i.e. one who lays (læg) money or property (fēoC, feo) together for a common purpose. The word was, therefore, the natural equivalent for *socius,* a member of the foundation of an incorporated college, as Eton, or a college at a university. In the earlier history of universities both the senior and junior members of a college were known as "scholars," but later, as now, "scholar" was restricted to those members of the foundation still in *statu pupillari,* and "fellow" to those senior graduate members who have been elected to the foundation by the corporate body, sharing in the government and receiving a fixed emolument out of the revenues of the college. It is in this sense that "fellow" is used at the universities of Oxford and Cambridge and Trinity, Dublin. At these universities the college teaching is performed by those fellows who are also "tutors." At other universities the term is applied to the members of the governing body or to the holders of certain sums of money for a fixed number of years, devoted to special study or research. By analogy the word is also used of the members of various learned societies and institutions.

**FELLOWS, SIR CHARLES** (1799–1860), British archaeologist, was born in August 1790 at Nottingham, where his family had an estate. When fourteen he drew sketches to illustrate a trip to the ruins of Newstead Abbey, which afterwards appeared on the title-page of Moore's *Life of Lord Byron.* In 1820 he settled in London, where he became an active member of the British Association. In 1837 he discovered the modern ascent of Mont Blanc. After the death of his mother in 1832 he parted the greater portion of his time between Italy, Greece and the Levant. The numerous sketches he executed were largely used in illustrating *Childe Harold.* In 1838 he went to Asia Minor, making Smyrna his headquarters. His explorations in the interior and the south led him to districts practically unknown to Europeans, and he thus discovered ruins of a number of ancient cities. He entered Lycia and explored the Xanthus from the mouth at Patara upwards. Nine miles from Patara he discovered the ruins of Xanthus, the ancient capital of Lycia, finely situated on hills, and abounding in magnificent remains. About 15 m. farther up he came upon a fixed number of years devoted to special study or research. He returned to Smyrna through Caria and Lydia. The publication of *A Journal written during an Excursion in Asia Minor* (London, 1839) roused such interest that Lord Palmerston, at the request of the British Museum authorities, asked the British consul at Constantinople to get leave from the sultan to ship a number of the Lycian works of art. Late in 1839 Fellows, under the auspices of the British Museum, again set out for Lycia, accompanied by George Scharf, who assisted him in sketching. This second visit resulted in the discovery of thirteen ancient cities, and in 1841 appeared *An Account of Discoveries in Lycia,* being a *Journal kept during a Second Excursion in Asia Minor.* A third visit was made late in 1841, after Fellows had obtained a *ferman* by personal application at Constantinople. He shipped

**FEELING—FELONY**

a number of expeditions for England, and in the fourth and most famous expedition (1844) twenty-seven cases of marbles were despatched to the British Museum. His chief discoveries were at Xanthus, Pinara, Patara, Tlos, Myra and Olympus. In 1844 he presented to the British Museum his portraits, accounts of the expeditions, and specimens of natural history illustrative of Lycia. In 1845 he was awarded a grant of £300 by the Government of his services in the removal of the Xanthian antiquities to this country." He paid his own expenses in all his journeys and received no public reward. Fellows was twice married. He died in London on the 8th of November 1860.

In addition to the works above mentioned, Fellows published the following: *The Xanthian Marbles; their Acquisition and Trans- mission to England* (1843), a relation of false statements that had been published; *An Account of the Trojan Trophy Monument excavated at Xanthus* (1848); a cheap edition of his two Journals, entitled *Intemel and Researches in Asia Minor, peculiarities in the Phenomena of Lycia* (1852); and *Coins of Ancient Lycia before the Reign of Alexander; with an Essay on the Relative Dates of the Lycian Monu- ments in the British Museum* (1855). See C. Brown's *Lives of Notting- hamshire Worthies* (1882), pp. 352–353, and *Journal of Roy. Geog. Soc.,* 1861.

**FELO DE SE** (M.L. a felon, i.e. murderer, of himself), one who commits murder upon himself. The technical conditions of murder apply to this crime; e.g., "if one commits any unlawful malicious act, the consequence of which is his own death, as if attempting to kill another he runs upon his antagonist's sword, or shoots at another which is obscure, but is possibly connected either with Lat. fel, gall, or felone, or with Teutonic "fell" cruell, or fierce, is also connected; and the Greek φιλον, an impostor, has also been suggested). Legal writers have sought to throw light on the nature of felony by the supposed etymology of the word. Coke says it *crimen animo fellone perpetratum* [a crime committed with malicious or evil intent (see *felon*)]. Spelman connects it with the word *feci,* signifying fie or feud; and felony in this way would be equivalent to *preedium feodi,* an act for which a man lost or gave up his fee (see *Stephen's Commentaries,* vol. iv. p. 7.). And acts involving forfeiture were termed in feudal law, "felonies," the idea being that they were criminal character about them. A breach of duty on the part of the vassal, neglect of service, delay in seeking investiture, and the like were felonies: so were injuries by the lord against the vassal. Modern writers are now disposed to accept Coke's definition. In English law, crimes are usually classified as treason, felony, misdemeanour and summary offence. Some writers—and with some justice—treat treason merely as a grave form of felony and it is so dealt with in the *Juries Detention Act* 1897. But owing to legislation and since the time of William and Mary, the procedure for the trial of most forms of treason differs from that of felony. The expression summary offence is ambiguous. Many offences which are at common law or by statute felonies, or misdemeanours indictable at common law or by statute, may under certain conditions be tried by a court
of summary jurisdiction (q.v.), and many merely statutory offences, which would ordinarily be punishable summarily may at the election of the accused be tried by a jury on indictment (Summary Jurisdiction Act 1879, s. 17).

The question whether a particular offence is felony or misdemeanor can be answered only by reference to the history of the offence and not by any logical test. For instance, killing a horse in an unlicensed place is still felony under a statute of 1786. But most crimes described as felonies are or have been capital offences at common law or by statute, and have also entailed on the offender attendant and forfeiture of goods. A few felonies were not punishable by death, e.g. petty larceny and misdemeanour. Where an offence is declared a felony by statute, the common law punishments and incidents of trial attach, unless other statutory provision is made (Blackstone, Commentaries, iv. 94).

The chief common law felonies are: homicide, rape, larceny (i.e. in ordinary language, theft), robbery (i.e. theft with violence), burglary and kindred offences. Counterfeiting the coin has been made a felony instead of being treason; and forgery of most documents has been made a felony instead of being, as it was at common law, a misdemeanor. At the beginning of the 19th century felony was almost equivalent to capital crime; but during that century capital punishment was abolished as to all felonies, except wilful murder, piracy with violence (7 W. IV. & 1 Vict. c. 88, s. 2) and offences against the Dockyards, &c., Protection Act 1772; and by the Forfeiture Act 1870, a felon no longer forfeits land or goods on conviction, though forfeiture on outlawry is not abolished. The usual punishment for felony under the present law is penal servitude or imprisonment with or without hard labour. "Every person convicted of any felony for which no punishment is specially provided by the law in force for the time being is liable upon conviction thereof to be sentenced to penal servitude for any period not exceeding seven years, or to be imprisoned with or without hard labour for any term not exceeding two years" (Stephen, Dig. Cr. Law (6th ed.), art 18, Penal Servitude Act 1891). A felon may not be fined or whipped on conviction nor put under recognition to keep the peace or be of good behaviour except under statutory provision. (See Offences against the Person Act 1861, ss. 5, 71.)

The result of legislative changes is that at the present time the only practical distinctions between felony and misdemeanour are:

1. That a private person may arrest a felon without judicial authority and that bail on arrest is granted as a matter of discretion and not as of right. Any one who has obtained a drove of oxen or a flock of sheep by false pretences may go quietly on his way and no one, not even a peace officer, can apprehend him without a warrant, but if a man offers to sell another a bit of dead fence supposed to have been stolen, he not only may but is required to be apprehended by that person (Greaves, Criminal Law Consolidation Acts). (See Arrest, Bail.)

2. That on an indictment for felony counts may not be joined for different felonies unless they form part of the same transaction. (See Indictment.)

3. That on a trial for felony the accused has a right peremptorily to challenge, or object to, the jurors called to try him, up to the number of twenty. (See Jury.)

4. That a felon cannot be tried in absentia, and that the jury who try him may not separate during the trial without leave of the court, which may not be given in cases of murder.

5. That a special jury cannot be empanelled to try a felony.

6. That peers charged with felony are tried in a special manner. (See Peerage.)

7. That the costs of prosecuting all felonies (except treason felony) are paid out of public funds; and that a felon may be condemned to pay the costs of his prosecution and to compensate up to £100 for any loss of property suffered by any person through or by means of the felony. In the Criminal Code Bills of 1878-1886 it was proposed to abolish the term felony altogether: and in the Queensland Criminal Code 1899 the term "crime" is substituted, and within its connotation are included not only treason and piracy but also perjury.

8. That a sentence of a felon to death, or to penal servitude or imprisonment with hard labour or for over twelve months, involves loss of and disqualification for certain offices until the sentence has been served or a free pardon obtained. (Forfeiture Act 1870.)

It is a misdemeanor (i.) to compound a felony or to agree for valuable consideration not to prosecute or to show favour in such prosecution; (ii.) to omit to inform the authorities of a felony known to have been committed (see Misprision), and, (iii.) not to assist in the arrest of a felon at the call of an officer of the law. (See CRIMINAL LAW; MISPRISION; JURISPRUDENCE.)

FELSITE, in petrology, a term which has long been generally used by petrologists, especially in England, to designate fine-grained igneous rocks of acid (or subacid) composition. As a rule their ingredients are not determinable by the unaided eye, but they are principally felspar and quartz as very minute particles. The rocks are pale-coloured (yellowish or reddish as a rule), hard, splintery, much jointed and occasionally nodular. Many felsites contain porphyritic crystals of clear quartz in rounded blebs, more or less idiomorphic felspar, and occasionally biotite. Others are entirely fine-grained and micro- or cryptocrystalline. Occasionally they show a felsparic banded structure which may also be spherulitic or vesicular. Those which carry porphyritic quartz are known as quartz-felsites; the term soda-felsites has been applied to similar fine-grained rocks rich in soda-felspar.

Although there are few objections to the employment of felsite as a field designation for rocks having the above characters, it lacks definiteness, and has been discarded by many petrologists as unsuited for the exact description of rocks, especially when their microscopic characters are taken into consideration. The felsites accordingly are broken up into "granite-porphyrists" "orthoclase-porphyries," "orthoclase-riolites," "kryptophytes," "microgranites," &c. But felsite or microfelsite is still the generally accepted designation for that very fine-grained, almost cryptocrystalline substance which forms the ground-mass of so many rhyolites, dacites and porphyries.

In the hand specimen it is a dull, lustless, stoney-looking aggregate. Under the microscope even with high powers and the very thinnest modern sections, it often cannot be resolved into its components. In places it may contain determinable minute crystals of quartz; less commonly it may show grains which can be proved to be felspar, but usually it consists of an ultra-microscopic aggregate of fibres, thread-like grains, which react to polarized light in a feeble and indefinite manner. Spherulitic, spotted, streaky and fluidal structures may appear in it, and many different varieties have been established on such characters as these but without much validity.

Its association with the acid rocks, its hardness, method of weathering and chemical composition, indicate that it is an intermixture of quartz and acid felspar, and the occasional presence of these two minerals in well-defined grains confirms this. Moreover, in many dikes, while the ground-mass is predominantly fine-grained and consists of quartz and felspar near the centre of the mass, towards the margins, where it has been rapidly chilled by contact with the cold surrounding rocks, it is felsitic. The very great viscosity of acid magmas prevents their molecules, especially when cooling takes place suddenly, from arranging themselves to form discrete crystals, and is the principal cause of the production of felsitic ground-masses. In extreme cases these conditions hinder crystallization altogether, and glassy rocks result. Some rocks are felsitic in parts but elsewhere glassy; and it is not always clear whether the felsite is an original substance or has arisen by the devitrification of primary glass. The presence of perlitic structure in some of these felsites points to the latter conclusion, and the results of an examination of ancient glasses and of artificial glass which has been slowly cooled are in accordance with this view. It has been argued that felsite is a eutectic mixture of quartz and felspar, such that when solidification takes place and the excess of felspar (or quartz) has
crystallized out it remains liquid till the temperature has fallen to its freezing point, and then consolidates simultaneously. This may be so, but analyses show that it has not always the same composition and consequently that the conditions which determine its formation are not quite simple. Felsitic rocks are sometimes silicified and have their matrix replaced by granular aggregates of various felspars.

**FELSPAR.** or **FELSpar, a name applied to a group of mineral silicates of much importance as rock-constituents.** The name, taken from the Ger. **Feldspath,** was originally written with the "d", and only from 1794 was it written "felspar" by R. Kirwan, on the assumption that it denoted a mineral of the "feld" rather than of the "field," and this corrupted form is now in common use in Germany. By some of the earlier mineralogists it was written "felspar," from the Swedish word fälspat.

The felspar group is divided into two subgroups according to the symmetry of the crystals. Although the crystals of all felspars present a general resemblance in habit, they are usually regarded as belonging to two systems, some felspars being monoclinic and others anorthic. Figures of the crystals are given in the articles on the different species. Two cleavages are generally well marked. In the monoclinic or monosymmetrical felspars these, being parallel to the basal pinacoid and clinopinacoid, necessarily make an angle of 90°, whence the name orthoclase applied to these minerals; whilst in the anorthic or asymmetric felspars the corresponding angle is never exactly 90°, and from this obliquity of the principal cleavages they are termed plagioclase (see Orthoclase and Plagioclase). There are consequently two series of felspars, one termed ortho- or orthorhombous, and the other plagioclasic or clinorhombous. F. E. Mallard suggested that all felspars are really asymmetric, and that orthoclase presents only a pseudo-monosymmetric habit, due to twinning. Twin-crystals are very common in all the felspars, as explained under their respective headings.

The two divisions of the felspar-group founded on differences of crystalline symmetry are subdivided according to chemical composition. All the felspars are silicates containing aluminium with some other metallic base or bases, generally potassium, sodium, or calcium, rarely barium, but never magnesium or iron. The monoclinic series includes common potash-felspar or orthoclase (KAlSi₃O₈) and other extreme the lime-felspar anorthite (CaAl₂Si₂O₈). It was suggested by G. Tschermak in 1864 that the other plagioclastic felspars are isomorphous mixtures in various proportion of albite (Ab) and anorthite (An). These intermediate members are the lime-soda felspars known as oligoclase, andesine, labradorite and bytownite. There are also placed in the anorthic class a potash-felspar called microcline, and a rare soda-potash-felspar known as anorthoclase.

The specific gravity of the felspars has been shown by G. Tschermak and V. Goldschmidt to vary according to their chemical composition, rising steadily from 2.57 in orthoclase to 2.75 in anorthite. All the felspars have a hardness of 6 to 6.5, being therefore rather less hard than quartz. Pure felspar is colourless, but the mineral is usually white, yellow, red or green. Certain felspars are used as ornamental stones on account of their colour (see Amazon Stone). Other felspars are prized for their pearly opalescence (see Moonstone), or for their play of iridescent colours (see Labradorite), or for their spangled appearance, like aventurine (see Aventurine). Felspar is applied in the manufacture of porcelain by reason of its fusibility. In England the material employed is mostly orthoclase from Scandinavia, often known as "Swedish spar." The high transluency of "ivory porcelain" depends on the large proportion of felspar in the body. The mineral is also an important constituent of most ceramic glazes. The melting points of felspars have been investigated by Prof. J. Joly, Prof. C. A. Docter y Cisterich and especially by A. L. Day and E. T. Allen in the Geophysical Laboratory of the Carnegie Institute at Washington.

Among the applications of felspar is that of pure orthoclase in the manufacture of artificial teeth.

Felspar readily suffers chemical alteration, yielding kaolin (q.v.). The turbidity of orthoclase is usually due to partial kaolinization. Secondary mica is also a common result of alteration, and among other products are pittance, epidote, saussurite, chlorite, wollastonite, and wallisite.

See Albite, Amazon Stone, Adesine, Anorthite, Bytownite, Labradorite, Microcline, Moonstone, Oligoclase, Orthoclase, Plagioclase, Sun-stone.

**FELSTONE.** or **FELSTead, a village of Essex, England, between Dunmow and Braintree, and 10 m. from Chelmsford; with a station on the Great Eastern railway.** It is distinguished by reason of its important public school, dating back to its foundation as a grammar school in 1564 by Richard 1st Baron Rich, who as lord chancellor and chancellor of the court of augmentations had enriched himself with the spoil of the adjoining abbey and priory of Little Leez at the dissolution of the monasteries. It became a notable educational centre for Puritan families in the 17th century, numbering a hundred or more pupils, under Martin Holbeach (1600-1670), headmaster from 1627-1649, and his successors C. Glasscock (from 1639 to 1649), Oliver S Pink (1649 to 1670), John Wallis and Isaac Barrow were educated here, and also Squier, Cromwell, Robert, Oliver, Richard (the Protector), and Henry. Another era of prosperity set in under the headmastership of William Trivett (1745-1830) between 1778 and 1794; but under his successors W. J. Carless (from 1794 to 1813) and E. Squire (from 1813 to 1829) the numbers dwindled. As the result of the discovery by T. Surridge (headmaster 1839-1850), from research among the records, that a larger income was really due to the foundation, a reorganization took place by act of parliament, and in 1851, under the headmastership of Rev. A. H. Wratilaw, the school was put under a new governing body (a revised scheme coming into operation in 1876). The result under Rev. W. S. Grignon (1873-1907), the headmaster from 1856 to 1875, who may be considered almost the second founder, was the rapid development of Felsted into one of the regular public schools of the modern English type. New buildings on an elaborate scale arose, the numbers increased to more than 200, and a complete transformation took place, which was carried on under his successors D. S. Ingram (from 1875 to 1890), H. A. Dalton (1896), and F. Stephenson, under whom large extensions to the buildings and playing-fields were made. See John Sargeant, History of Felsted School (1880); and Alumni Felstadiensis, by R. J. Beevor, E. T. Roberts and others (1903).

**FELT** (cognate with Ger. *Fell, Dünnfilz, Swed. and Dan. fill*; the root is unknown; the word has given Med. Lat. *filirum, "filter"), a fabric produced by the "matting" or "felting" together of fibrous materials such as wools, hairs, furs, &c. Most textile fibres (see Fibres) possess the quality of matting to some extent, but wools, furs and some few hairs are the only fibres which can be felted satisfactorily. It is probable that the quality of felting must be attributed to the scale structure and waviness of the wools, furs and hairs referred to. When it is desired to incorporate non-felting fibres in felt cloths, wool must be employed to "carry" them.

There are two distinctly classes of felts, viz. woolen or "thread-structure" felts, and " fibre " or true felts. In the manufacture of thread-structure felts, wools possessing the quality of felting in a high degree are naturally selected, carefully sorted so that the felting quality is not seriously damaged, spun into woolen yarn possessing the necessary fibre arrangement and twist, woven into cloth of such a character that subsequently satisfactory shrinking or felting may be effected, and finally scoured, milled in the stocks of machine of both, dyed and finished on the lines of an ordinary woolen fabric. The lighter styles of woven felts may be composed of a single cloth only, but for the heavier styles two or more cloths are woven, one on top of the other, at one and the same time, arrangements being made to stitch the cloths together during the weaving operation.

Fibre felts are exceedingly interesting from the historical point of view. It is now generally admitted that the art of
weaving preceded that of spinning, and it must further be conceded that the art of felting preceded that of weaving, so that the felt fabric is probably one of the oldest of the various styles of recognized fabrics. The inhabitants of the middle and northern regions of Asia seem to have employed felt from time immemorial as clothing and also as a covering for their habitations. Most of the classical writers refer to it and some of them actually describe its manufacture. Felt was also largely employed by the ancients for their hats, outer garments, and sometimes as a species of armour.

Fibre felts may be divided into three classes, viz.: ordinary felts; hat felts; and impregnated felts. As all felts are based upon the ordinary felt, the process of manufacture of this will first be described. Of the woods employed the principal are:—East Indian, German or mid-European, New Zealand cross-breds, and Australian. Carded up while the following merinos, vegetable fibres and silk are also employed, but wool must be used to carry them; thus a good felting wool may be made to carry its own weight of cotton, hemp, &c. Hairs and furs are principally used in the hat felts. The average loss upon the wool from the raw state to the finished felt is 40 to 50%. The order of the manufacturing processes is as follows:—mixing, willowing, teasing, and carding. It is interesting to note that it is not usual to scour felting wools. This is not because they are really clean—some are dirty—but because the felting property is liable to be interfered with in the scouring operation. Some wool, length, and thickness, must be reserved to ensure satisfactory working in the machines. From the card the wool is delivered as a gossamer-like film from 30 to 60 in. wide on to an endless film from 30 to 60 yds. long, upon which the felt is built up film upon film until the required thickness—perhaps 4 in.—is obtained. To harden this somewhat tender sheet of felt it is now passed through an ironing process, effected by either steam-heated rollers—to which a rotatory and vibratory motion is given—playing upon the continually drawn-through cloth; or a huge vibrating flat-iron, to which the cloth is automatically fed, held in position, and then wound up while the following length to be treated is drawn under the iron. Soaping, fulling, or "felling" and the ordinary finishing operations—including dyeing and printing if desirable—now follow, so that ultimately a strong firm fabric is turned out. It must be admitted, however, that the strength is much greater lengthwise than cross-wise, owing to the parallelization of the fibres induced in the willowing and carding operations. Of course, the true felting or contraction occurs in the fulling or felting stock, the fabric being perpetually "hammered" in the presence of fulling agents such as soap, fuller's earth, &c., for a considerable time. The reduction in width, length, and thickness is remarkable. This may be controlled within certain limits. The principal styles of ordinary fibre-felts are:—linings for coats, furniture and rubber shoes; saddlery; seatings for carriages and pew; carpets, surrounds and under-felts for carpets; mantles, dresses and table-cloths; felt-slippers; mattress felts; chest-preservers, and shoulder-pads; steam-engine packing, motor-car and anti-vibration felts, shipbuilding felts; drawing-roller felts and gun-wad felts.

Hat felts may be divided into two classes, viz. those made from wool and fur respectively. Wool "bodies" used for the lower quality hats are manufactured in the same way as ordinary felts, but the "shape" upon which the film issuing from the carder is built up takes the form of a double cone and thus approximates to the shape of the two hats ultimately formed. The shape is further controlled and developed in the fulling or felting operation. In the fur hat felts an air-blast is employed to carry the finely separated fibres on to the shape required, upon which shape the fibres are held in position by suction until the required thickness is obtained. The structure is then further developed and "stiffened," i.e., impregnated with certain stiffening agents according to requirements. If desirable the exterior fibres blown on to any shape may be of a different material from the body fabric. Impregnated felts are simply felts made in the ordinary way but subsequently impregnated with certain agents which give a special quality to the fabric. Messrs McNell & Co., of London, were the originators of "asphalted-felt" for roofing and, among other styles, place on the market sheathing felt, inodorous felt, dry hair felt, foundation felt, &c., &c. A later development, however, is the impregnated iron-felt manufactured by Messrs Mitchell's, Ashworth, Stansfield & Co., of Waterfoot, near Manchester, who not only produce from 70 to 85% of the ordinary felts manufactured in Great Britain, but also place on the market several specialties of which this "iron-felt" is largely used in the construction of bridges, &c., and as a substitute for rubber, it being apparently more durable. (A. F. B.)

FELTHAM, or FELTHAM, OWEN (d. 1668), English moralist, was the son of Thomas Feltham or Feltham of Mutford in Suffolk. The date of his birth is given variously as 1622 and 1609. He is inaccurately, and as the author of a volume entitled Resolves, Divine, Moral and Political, containing one hundred short and pithy essays. To later issues of the Resolves Feltham appended Lusoria, a collection of forty poems. Hardly anything is known of his life except that T. Randolph, the adopted "son" of Ben Jonson, addressed a poem of compliment to him, and became his friend, and that Feltham attacked Ben Jonson in an ode shortly before the aged poet's death, but contributed a flattering elegy to the Jonsonus Viribus in 1638. Early in life Feltham visited Flanders, and published observations in 1652 under the title of A Brief Character of the Low Countries. He was a strict high-churchman, and was so much attacked by Charles I. as "Chist the Second," Hallam, to stigmatize Feltham as one of our worst writers. He has not, indeed, the elegance of Bacon, whom he emulated, and he is often obscure and affected; but his copious imagery and genuine penetration give his reflections a certain charm. To the middle classes of the 17th century he seemed a heaven-sent philosopher and guide, and was only less popular than Francis Quarles the poet.

Eleven editions of the Resolves appeared before 1700. Later editions by James Cumming (London, 1866; much garbled; has his personal application that he could not live without a captaincy) and O. Smenton in "Temple Classics" series (London, 1904).

FELTON, CORNELIUS CONWAY (1807-1862), American classical scholar, was born on the 6th of November 1807, in West Newbury, Massachusetts. He graduated at Harvard College in 1827, having taught school in the winter vacations of his sophomore and junior years. After teaching in the Livingstone high school of Geneseo, New York, for two years, he became tutor at Harvard in 1829, university professor of Greek in 1832, and Eliot professor of Greek literature in 1834. In 1830 he succeeded James Walker as president of Harvard, which position he held until his death, at Chester, Pennsylvania, on the 26th of February 1862. Of his editorial style of the Histories, the opinion of W. H. Glazier of the Illiad (1853) is especially valuable. Greece, Ancient and Modern (2 vols., 1867), forty-nine lectures before the Lowell Institute, is scholarly, able and suggestive of the author's personality. Among his miscellaneous publications are the American edition of Sir William Smith's History of Greece (1855); translations of Menzel's German Literature (1840), of Munk's Metres of the Greeks and Romans (1843), and of Goyot's Earth and Man (1849); and Familiar Letters from Europe (1865).

FELTON, JOHN (c. 1593-1628), assassin of the 1st duke of Buckingham, was a member of an old Suffolk family established at Playford. The date of his birth and the name of his father are unknown, but his mother was Eleanor, daughter of William Wright, mayor of Durham. He entered the army, and served as a lieutenant in the expedition to Caciz commanded by Sir Edward Cecil in 1625. His career seems to have been ill-starred and unfortunate from the beginning. His left hand was early disabled by a wound, and a morose temper rendered him unpopular and prevented his advancement. Every application made to Buckingham for his promotion was rejected, on account of an ancestry, according to Sir Simonds D'Ewes, which existed between Felton and Sir Henry Hunger, a favourite of the exiled king. His application that he could not live without a captaincy Buckingham replied harshly "that he might hang." Whether be
took part in the expedition to Rêh in 1627 is uncertain, but there is no doubt that he continued to be refused promotion, and that even his scanty pay earned during the Cadiz adventure was not received. Exasperated by his ill-treatment, his discontent sharpened by poverty, and his hatred of Buckingham intensified by a study of the Commons' Remonstrances of the previous June, and by a work published by Eglesham, the physician of James I., in which Buckingham was accused of poisoning the king, Felton determined to effect his assassination. He bought a tuppenny knife on Tower Hill, and on his way through Fleet Street he left his name in a church to be prayed for as "a man much discontented in mind." He arrived at Portsmouth at 9 o'clock in the morning of the 23rd of August 1628, and immediately proceeded to No. 10 High Street, where Buckingham was lodged. Here mingling with the crowd of applicants and unnoticed he stabbed the duke, who immediately fell dead. Though escape would have been easy he confessed the deed and was seized and conveyed to the Tower, his journey thither, such was the unpopularity of the duke, being accompanied by cries of "God bless thee" from the people. Charles and Laud desired he should be racked, but the illegal torture was prevented by the judges. He was tried before the king's bench on the 27th of November, pleaded guilty, and was hanged the next day, his body being exposed in chains subsequently at Portsmouth.

FELTRE, MORTO DA—FENCING. 247

FELTRE, MORTO DA, Italian painter of the Venetian school, who worked at the close of the 15th century and beginning of the 16th. His real name appears to have been Pietro Luzzo; he is also known by the name Zanobi Verzotto, or Zanobi da Verona. His father, a surgeon, was in Zara during the 16th century: whether he was termed Morto (dead) from his joyless temperament is a disputed point. He may possibly have studied painting first in Venice, but under what master is uncertain. At an early age he went to Rome, and investigated the ancient, especially the subterranean remains, and thence to Pozzuoli, where he painted from the decorations of antique crypts or "grotte." The style of fanciful arabesque which he formed for himself from these studies gained the name of "grottesche," whence comes the term "grottesque," not, indeed, that Morto was the first painter of this Invention. Relevance, far art of this kind had, apart from his influence, been fully developed, both in painting and in sculpture, towards 1480, but he may have powerfully aided its diffusion southwards. His works were received with much favour in Rome. He afterwards went to Florence, and painted some fine grotesques in the Palazzo Publico. Returning to Venice towards 1505, he assisted Giorgione in painting the Fondaco dei Tedeschi, and seems to have remained with him till 1511. If we may trust Ridolfi, Morto eloped with the mistress of Giorgione, whose grief at this transaction brought him to the grave, the allegation, however, is hardly reconcilable with other accounts. It may have been in 1515 that Morto returned to his native Feltre, then in a very ruinous condition from the ravages of war in 1509. There he executed various works, including some frescoes, still partly extant, and considered to be almost worthy of the hand of Raphael, in the loggia beside San Stefano. Towards the age of forty-five, Morto, unquiet and dissatisfied, abandoned painting and took to soldiering in the service of the Venetian republic. He was said to have been a captain of a troop of two hundred men, and fighting valorously, he is said to have died at Zara in Dalmatia, in 1520. This story, and especially the date of it, are questionable; there is some reason to think that Morto was painting as late as 1522. One of his pictures is in the Berlin museum, an allegorical subject of "Peace and War."

Andrea Feltrini was his pupil and assistant as a decorative painter.

FELTRE (anc. Feltria), a town and episcopal see of Venetia, Italy, in the province of Belluno, 20 m. W.S.W. of it by rail, situated on a island, 885 ft. above sea-level. Pop. (1901) 5468 (town), 15,243 (commune). The cathedral has a fine polygonal apse of the 16th century. The Palazzo del Consiglio is a very beautiful building, and one of the most interesting in the town, the Piazza Maggiore, is the central by which the town is supplied with water, and a large fountain. There are some remains of the medieval castle. The ancient Feltria, which lay on the road (Via Claudia) from Opitergium to Tridium, does not seem to have been a place of any importance under the Romans. Vittorio dei Rambaldoni da Feltre (1378-1446) was a famous educator and philosopher of his time.

FELTRO (anc. Feltria), a town of Italy, pop. 5000. It is in the province of Belluno, and is famous for its production of fine cloth. The town is situated on a spurs of the Alps, and is well watered with springs. The climate is healthy, and the scenery picturesque. There are good roads leading to other towns in the vicinity.

FELTRO, MORTO DA, an Italian painter of the 16th century, who studied in Venice and Rome. His style was characterized by a combination of the antique and the Gothic, and he is considered one of the early masters of the Venetian school. His works are notable for their grace and elegance, and he is remembered for his frescoes in the Palazzo del Consiglio, which are still admired today.

FEMALE, the correlative of "male," the sex which performs the function of conceiving and bearing as opposed to the begot ting of young. The word in Middle English is femelle, adopted from the French from the Lat. femella, which is a diminutive, and in classical Latin used strictly as such, of femina, a woman. The present termination in English is due to a connexion in ideas with "male." In various mechanical devices, where two corresponding parts work within the other, the receiving part is often known as the "female," as for example in the "male" and "female screw." The O. Fr. femelle, modern femme, occurs in legal phraseology in feme covert, a married woman, i.e. one protected or covered by a husband, and in feme sole, one not so protected, a widow or spinster (see Women and Husband and Wife).

FEMERELL (anc. Femeller), a town of Italy, pop. 14,000. It is in the province of Belluno, and is famous for its production of fine cloth. The town is situated on a spur of the Alps, and is well watered with springs. The climate is healthy, and the scenery picturesque. There are good roads leading to other towns in the vicinity. FEMERELL, properly FUMERELL (from O. Fr. fumerrer, Late, fumes, smoke), the old English term given to the lantern in the ridge of a hall roof for the purpose of letting out the smoke of the fire kindled on a central hearth.

FENCING. If by "fencing"—the art of fence, i.e. of defence or offence—were meant generally the dexterous use of the sword, the subject would be wide indeed; as wide, in fact, as the history of the sword (q.v.) itself. But, in its modern acceptation, the meaning of the word has become considerably restricted. The scope of investigation must therefore be confined to one kind of swordsmanship only: to that which depends on the regulated, artificial condition of "single combat." It is indeed this play, hemmed in by many restrictions, which we have come to mean more specially by "fencing." It differs, of course, in many respects, from what may be called the art of fighting in the light of nature. But as its restrictions are among the very elements which work to the perfection of the play, it is undoubtedly in the history of swordsmanship as applied to duelling (see DUEL) that we shall trace the higher development of the art.

It may be said that the history of fencing, therefore, would be tantamount to the history of private duelling. Now, this is an ethnical subject: one, again, which would carry the investigation too far; and it need not be taken up farther back than the middle of the 16th century, when, on the decline of the medieval waster of battle, the practice of private duelling began to take an assured footing in a warlike society. It is curious to mark that the first cultivation of refined cunning in fence dates from that period, which corresponds chronologically with the general disuse of armour, both in battle and in more private encounters. It is still more curious to note that, in order to fit himself to meet what was an illegal but aristocratic obligation, the gallant of those days had to appeal to a class of men hitherto little considered: to those plebeian adepts, in fact, who for generations had cultivated skill in the use of hand weapons, on foot and without armour. Thus it came to pass that the earliest masters of fence in all countries, namely, the masters of the art of conducting skilfully what was essentially considered as an honourable encounter, were almost invariably to be found among a somewhat disdained gentry—gladiators, free companions, professional champions, more or less openly recognized, or bravoes of the most uncompromising character.

In Germany, which is considered the cradle of systematic swordsmanship, these teachers of the sword had, as early as the 15th century, formed themselves into guilds; among which the best known were the Marsbrüder, or the Associates of St Marcus
of Löwenberg, who had their headquarters at Frankfort, and branches in all the more important towns. Similarly, in Spain and in northern Italy, professional swordsmen were at various times allowed to form themselves into recognized or at least tolerated associations.

In England “swordmen” had been looked upon with especial disfavour by the powers that were, until Henry VIII., who was a great lover of all manly exercises, found it likewise advisable to turn their obozioso existence to a disciplined and profitable channel by regularizing their position. The most respectable masters were allowed to form themselves into a company, with powers to increase their numbers with suitable and duly tried men, in imitation of the world-famed German Mardrada u. Marcabrusi. Under these conditions they were granted the use of arms and greatly increased the art of fighting in England. The enormous privileges that the king, in course of time, conferred on his Corporation of Masters of Defence very soon enabled it to put down or absorb all the more ferocious of independent swashbucklers, and thereby to impart to the profession a moderate degree of respectability under the coat of arms granted by the royal heralds: gules a sword pendant argent.

It was in the midst of such corporations and in teaching the fencing arts of independent swordsmen, therefore, that sprouted the first buds of systematic swordsmanship. Among the professional fencers, curiously and happily for the historian, there seem to have been a few with a literary turn of mind. The oldest manuscripts of fence belong to Italy and Germany. They deal with the methods of carrying out single combats on foot, with any of the most generally accepted weapons—longsword and short sword, dagger and every kind of knives, mace, club, and long and short staff, axes, &c., and with the tricks of wrestling recommendable therefor. Among the most comprehensive in their scope may be mentioned Il Fior di Battaglia of Maestro Fiore dei Liberi da Premaria; a work which, although illustrated with truly Italian tact and grace, is chiefly remarkable for its fencing style is concerned, unmistakable marks of German influence. The text of the MS. bears the date 1410, but the writer was known to be flourishing as a master of fence as early as 1383. A reprint of this invaluable codex has been published, under the care of Francesco Donati, by the Istituto Italiano d' Arti Grafiche. Another is the better known Thafother's Ficht Buch, gerichtliche und andere Zweykämpfe dorstellend (1467), a reprint of which, with its 268 plates in facsimile, was brought out by Gustave Herger in Prague. The oldest printed book is likewise German: Ergründung der ritterlicher Kunst der Fechtære, von Andreas Fechtär vindt, Freifechter zu Wien (1516). This work, which is exceedingly rare, is a very complete exposition of the ways of wielding long and short blades to the utmost of their lethal capacity. It was reproduced under various titles, very confusing to the bibliographer) in Frankfort, Augsburg, Strassburg, and finally done into French under the name of Le Noble science des joueurs d'épée, published in Paris and Antwerp, 1535.

Following the Germans, the oldest printed books of fence are Italian. The first French book on the sword is known to be a translation from the German. Curiously enough, the second, and one of the most notable, Le Traité d'épée seule, mère de toutes armes, of the Sieur de St. Didier, published in Paris in 1578, can be shown to be a transparent adaptation of two Italian treatises, the Trattato di scienza d' arme of Camillo Agrippa, and Grassi's Ragione di adoperar sicuramente l'armes, &c.

It is about this time, namely, the latter half of the 16th century, that swordsmanship pure and simple may be said to have found its origin; for then a great change is perceptible in the nature and tendency of fence books: they dissociate themselves from indecorous wrestling tricks, and approximate more and more to the consideration of what we understand by swordsmanship. The older works expounded the art of fighting generally; taught the reader a number of valuable, if not "gentlemanlike," dodges for overcoming an adversary at all manner of weapons: now the lucubrations of fence-masters deal almost exclusively with the walking sword, that is, the dulcement weapon—with the rapier in fact, both with and without its lieutenant, the dagger.

It must be remembered that at this period private duelling and cavalier quibbling was anticipated to a perfect mania. The fencing master was no longer merely a teacher of effeminacies, if rascally, tricks; he was becoming a model of gallant deportment; in many cases he was even a recognized arbiter on matters of honour. He was often a gentleman himself: at all events he posed as such.
